## THE WEEK.

ONE advantage of Free Trade is that all the materials used in their offices by English architects can be obtained at moderate prices, although they may be manufactured abroad. In Canada, where duties have to be paid on imported articles, it is necessary for an architect to imitate POPE, the poet, and become "paper-sparing." On drawing-paper the duty is 25 per cent. of value; one kind of tracing-paper also pays 25 per cent., while on another kind the duty rises to 35 per cent. On tracing linen, black print paper and blue print paper the duty is 35 per cent. Inks, colours, drawing and surveying instruments are mulcted with 25 per cent. It was probably expected that by taxing materials an impetus would be given to Canadian manufactures. But there are so few architects in any part of Canada, it would not be worth while to set up paper-mills in the expectation of their patronage. The tax, therefore, is levied on the incomes of architects, who cannot, in consequence, charge any higher commission to their clients.

A BILL has been drafted which, if it should become law, will enable local authorities to grant superannuation to officers and servants similar to what is allowed under the Poor Law Officers' Superannuation Act. It is assumed that a percentage varying from two to three per cent. of the salaries and emoluments will be subscribed by those who are to benefit by the arrangement. The proposed scale of superannuation is as follows:—An officer or servant who has served for ten years but less than eleven years shall be entitled to an annual allowance equal to ten-sixtieths of the average amount of his salary or wages and emoluments during the five years ending on the quarter day which immediately precedes the day on which he ceases to hold his office or employment, with an addition of one-sixtieth of such average amount for every additional completed year of service until the completion of a period of service of forty years, when a maximum allowance of forty-sixtieths shall be granted. It is provided that an officer who loses his appointment through fraud or grave misconduct forfeits all claim to superannuation, but he may be paid a sum which will correspond with his contribution to the fund. There can be no doubt that at present municipal officers have to suffer through the non-existence of an Act of the kind proposed. Engineers and surveyors give the best years of their lives to the public at salaries which are often inadequate, and when they are worn out by service it is with difficulty an arrangement can be made to create an office for them which will preserve them from want. The promoters of the scheme (the Municipal Officers' Association) are, therefore, entitled to general support.

LONDON can claim to be at the head of all cities in the world if valuation for taxation can be taken as a test. Its pre-eminence in that respect is not likely to be envied. It is now known that the valuation list prepared under the Valuation of the Metropolis Act, 1869, which will come in force on April 6, shows a decided advance on that at present in use. The gross value of London has now reached the enormous total of 43,461,733 $\frac{1}{2}$ l., the net value being 36,115,407 $\frac{1}{2}$ l. The previous one was gross 41,239,847 $\frac{1}{2}$ l., net being 34,230,334 $\frac{1}{2}$ l. Government property at last seems to be going to bear its fair share of the rates. An example of this is shown in

the parish of Islington, where the figures in April 1895 were 4,189 $\frac{1}{2}$ l., and are now shown as 10,391 $\frac{1}{2}$ l. In St. George's, Hanover Square, there is an increase under this one head of 4,292 $\frac{1}{2}$ l. In the parish of St. Margaret and St. John, Westminster, the figures show a still greater disparity, as in 1895 Government property was valued at 52,828 $\frac{1}{2}$ l., while this time it is shown at 89,159 $\frac{1}{2}$ l.

THE Urban District Council of Morecambe have at length realised that there can be no financial success without the aid of advertising. The same rule applies to picturesque districts as to individuals. The Council have lodged a Bill for next Session to empower them to expend a sum, equal to a rate of 2d. in the pound on the assessable value of the district, for the purpose of "advertising, pictorially or otherwise, the town of Morecambe, showing the advantages and attractions of its district." The preamble of the Bill states that advertising the district would conduce to its advantage, as its "prosperity is dependent on the visitors that resort thereto for health and recreation." Morecambe is a healthy place; but it is practically unknown beyond the surrounding district. Towns to which nature has been less bountiful are crowded with visitors because the authorities have understood the peculiarities of human nature, and know that the world will not believe in qualities which remain unadvertised. The Corporation of Bournemouth have also decided to be liberal in expenditure on a similar object.

FOR a time, at least, there is likely to be a cessation of the newspaper correspondence about the Peterborough Cathedral. On Wednesday the Dean and Chapter finally resolved to act upon the resolution of the restoration committee passed on November 25, 1896, and to carry out the work upon the north gable of the west front of the cathedral as advised by Mr. J. L. PEARSON, R.A., and Sir ARTHUR BLOMFIELD, A.R.A. The cost of this and of the further work of necessary repair recommended by the architect to be done at the west front and other parts of the cathedral is estimated at 11,000 $\frac{1}{2}$ l., of which sum rather more than 9,000 $\frac{1}{2}$ l. remains to be raised. If the suggestion about obtaining the opinion of the specialists had been adopted by the Dean and Chapter there would be less difficulty in obtaining the 9,000 $\frac{1}{2}$ l. required. But it is not likely that with so many censors who will watch the operations there will be any destruction of ancient work, unless such a course becomes unavoidable. It remains to be seen how far the public can take an interest in the project, and the subscription list will be evidence on that subject.

THE arrangements for holding the Salon of 1897 in a temporary building erected on the Place du Carrousel were no sooner completed than they were set aside. After all, the exhibition will be opened in a fragment of the Palais de l'Industrie which will be preserved from demolition for that purpose. But the term of the exhibition is to be brief, viz. from April 20 until June 8. The paintings will be received from March 5 to 10, sculpture from March 23 to 27, architectural drawings, engravings and lithographs on March 28 and 29. There will consequently be only three weeks allowed for judging and hanging works. If the purchasers are equally expeditious, some consolation will be afforded.

## THE LEICESTER HOSPITAL, WARWICK.

HERE are few more interesting relics of the past history of this country than the hospitals and almshouses which were founded in the Middle Ages as refuges for aged and indigent persons of both sexes. These institutions exist in various parts of the kingdom, and many of them are well worth a visit.

The Hospital of St. Cross, near Winchester, founded in 1136 by HENRY DE BLOIS,

Bishop of Winchester, with its handsome entrance tower, its picturesque dining-hall, cloister and brethren's dwellings,

and above all its magnificent church, is perhaps the most ancient of these institutions, but there are many of a later period which deserve notice, and we have chosen for our present illustrations the Leicester Hospital at Warwick.

Situated at the western end of the High Street, it commands a view of the distant country towards Stratford-on-Avon, and at once attracts the eye as a singularly picturesque group of buildings, the most striking feature being the chapel, which is built upon the ancient entrance-gate to that part of the town. The hospital is approached by a gentle ascent, which passes under an archway and leads to the chapel on the left and to a quadrangle on the right, around which are situated the master's lodgings and some of the pensioners' rooms, which latter are reached by a quaint staircase of massive timber-work: here, as well as in other parts of the building, numerous coats of arms, crests and badges of the

GENERAL VIEW AS ONE APPROACHES FROM THE TOWN.

VIEW FROM THE ROAD TO STRATFORD-ON-AVON LOOKING TOWARDS WARWICK.

Leicester family—prominently the bear and ragged staff—may be observed.

According to SMITH'S "History of the County of Warwick," the buildings appear to have been the halls of two guilds—one in honour of the Holy Trinity and the Blessed Virgin MARY, the other in honour of St. GEORGE the Martyr, both of which were founded in the time of RICHARD II., and were afterwards united. At the dissolution of the fraternity during the reign of HENRY VIII. the

master (according to a special clause in the deed of endowment) receiving only 50*l.* In 1813 considerable changes were made; the number of brethren was increased to twenty-two, each fresh pensioner, and ultimately the whole brotherhood, receiving an allowance of 80*l.*, and the master's salary being gradually raised to 400*l.* Vacancies as they occur are filled up by persons who have lived for not less than five years in the counties of Warwickshire or Gloucestershire—the preference in all cases is given to soldiers who

APPROACH TO BUILDINGS THROUGH THE ARCHWAY.

buildings became the property of ROBERT DUDLEY, Earl of Leicester, who, in the twenty-eighth year of the reign of ELIZABETH, converted them into a hospital for twelve impotent men, none of whom should possess as much as 5*l.* a year, and one master—a professor of divinity. The land with which the hospital was endowed produced at that time an annual income of 200*l.*, but in 1811 its value had so much increased that the annual income amounted to nearly 2,000*l.*, when each brother received 130*l.* per annum, the

have become "disabled or decayed in the service of their country." There was a regulation requiring the brethren to wear a blue gown with the Leicester badge—the bear and ragged staff—on the left sleeve, without which they were not allowed to appear in public. This rule, however, seems to be no longer in force, for the blue gown is seldom seen at the present time. The hall in which the meetings of the Guild are supposed to have been held is now converted into rooms for ten additional brethren. The chapel was

QUADRANGLE WITH STAIRCASE TO PENSIONERS' ROOMS.

given by ROGER DE NEWBURY in the reign of HENRY I. to St. Mary's Church when it was made collegiate.

The illustrations show (1) a general view of the buildings as one approaches them from the town, with the old entrance gate and the chapel surmounting it. (2) A view from the road to Stratford-on-Avon, looking towards Warwick. (3) The approach to the buildings through the archway mentioned above as leading to the chapel and quadrangle. (4) The quadrangle itself with the staircase leading to the pensioners' rooms.

### CHARACTERISTICS OF SOME GREAT LONDON THOROUGHFARES.—I.

[BY A CORRESPONDENT.]

IT is a common remark that Londoners know a good deal less of the "sights" of the great City than their country cousins, and there can be no doubt that to a considerable extent this is true as regards, say, St. Paul's, Westminster Abbey, the Tower, the Houses of Parliament, the National Gallery, &c. But, on the other hand, many of those who, by the force of various circumstances, have found it more expedient, or, it may be, really necessary, to live amongst that huge conglomeration of towns around a small nucleus, the City proper, have perhaps obtained a larger appreciation of the beauties of London (the writer uses this word advisedly) than those who on a cursory visit have passed through its main streets and duly admired what they saw, in a general way, but have naturally failed to observe and to grasp the possibilities of "what might be." Neither can they have realised "what is" in the same way that an observant inhabitant has had the opportunity of doing on many occasions. The writer purposely uses the last expression, because it is a matter of experience how those who daily traverse a particular route are too apt to take everything as a matter of course, and fail to notice objects that would strike a stranger. The homely proverb,

"Familiarity breeds contempt," in this instance can be accurately brought to bear without being misapplied, as unfortunately is sometimes the case with proverbs.

Now what it is proposed to enlarge upon in these brief articles is the aspect of some of our great London roads and streets as viewed in a catholic manner (to use the adjective in a general, not ecclesiastical sense, and so with a small c). It would, therefore, not be amiss to start at the threshold of one of the main arteries of London, the southernmost of the great thoroughfares on the Middlesex bank of the Thames. Let us make a beginning at Abingdon Street, Westminster, to the south of the majestic Victoria Tower, the base of which is so well set off by the pretty public pleasure-ground between the street and the river. The irregular character of the roadway to the west of this great tower, in the manner of its varying widths (it is not a "Place" and cannot be called a street), with the grouping of the Abbey and St. Margaret's, has a pleasing effect owing to the absence of any cold formality, quite suited to the Mediæval surroundings.

Leaving Palace Yard and stopping opposite the Foreign Office and facing south, one has to consider what the effect will be when the long threatened and closely approaching demolition of the west side of Parliament Street has been accomplished. No doubt a splendid improvement will result in thus making a stately approach to the seat of the Legislature as also a great boon to the increasing traffic, for the police complain now about the congestion in this part. But the writer desires rather to look at the question from an entirely different standpoint. There are still a great many persons who do not care about everything being laid bare and open, as if Röntgen rays were circulating everywhere. "There is the rub." It is not only that Westminster Abbey and St. Margaret's reveal their outline gradually from a distance viewed from the north, but it is to some extent much the same with the Houses of Parliament, excepting, of course, the Clock Tower, for otherwise the latter would lose its *raison d'être*. However stately may be the new Public Offices erected between Parliament Street and St. James's Park, we shall lose that feeling of

(which often happens when the comparatively narrow defile of Parliament Street is being passed) at the beauty of the group of buildings around "the Square," almost suddenly revealed to view. Of course the writer is rather alluding to the impressions of the stranger to London, or it may be foreigner. On the other hand, the clearing away of modern accretions which have been injudiciously permitted to occupy spaces once open—as, for example, those houses near Poets' Corner, which almost entirely blocked up and concealed the approach to the Westminster Chapter-house—has been a distinct gain in every way. The same remark, but in the present tense, applies to the bookseller's shop built up against the north side of the tower of St. Stephen's Church, Walbrook, which entirely hides its lower stages, and is altogether incongruous. Many years since, in the time of the predecessor of Dr. FARRAR in the Rectory of St. Margaret, Westminster, there was a considerable talk about pulling down this church so as to show more of the Abbey, and there was a powerful party in strong favour of this vandalistic project; which, happily, was dropped. Any student of history is aware that it was not at all uncommon for a parish church to be in close proximity to a cathedral, and in the case of St. Gregory's Church, hard by Old St. Paul's, the attachment was very near indeed. But this building was much smaller than St. Margaret's and of earlier date. These churches, looked at from an architect's point of view, helped to give scale to the cathedrals they adjoined. However, that near Old St. Paul's never rose again from its ashes after the Great Fire; and even if it had, would have been most unlikely to have survived the urgent calls for more space in the crowded City with its yearly increase of traffic.

After this slight digression into the City, which will be treated of in due course, the writer would emphasise the peculiar beauty of the great thoroughfare called "Whitehall" in its brief course from Parliament Street till it merges into that mysterious irregularly-shaped locality now termed Charing Cross, the puzzle to strangers and cabmen who want to find a particular number. Now one cause of this unique London thoroughfare's picturesqueness, notwithstanding many elements wanting to qualify it for the last-named title, is the varying width, ending with the "bottle-neck end" about opposite Drummond's Bank, just before the great expansion into Trafalgar Square. Then there is the slight bend in the road and gentle incline up towards Charing Cross, and the two historic buildings on either side, *i.e.* INIGO JONES'S fine fragment of that royal palace never carried out, and the Horse Guards. One might fairly add the Admiralty, plain and unpretentious as it is. But beyond these advantages which this noble street possesses, there is to be noticed the gardens with their trees, on the east side, which are the more to be valued because a goodly portion of them is Government property that has been threatened to be used for new Public Offices, badly wanted as additions to the present overcrowded buildings. It is most sincerely to be hoped that no diminution will be attempted of this effective open space, such a help towards good impressions of the approach to the seat of the Legislature.\* The writer has purposely not alluded to other and less ancient public offices between Bridge Street and Charing Cross than those previously mentioned, as they do not, in his opinion, assist much towards that effect he has been endeavouring to describe, though that palatial structure, Whitehall Court, notwithstanding being set back some way from the great thoroughfare now commented on, tends to dignify this part of London by its picturesque Château-like outline. It is, however, certainly a blemish to look at the unsightly mass of the back of the Hôtel Victoria (in Northumberland Avenue), marring the formerly fine view of St. Martin-in-the-Fields tower. The only antidote to this would be some new building on the east side of Charing Cross which would block it out. But the remedy would be almost as bad as the disease.

Trafalgar Square has been so often described that it would be difficult to remark anything fresh about it. But as the writer was very familiar with the locality before Northumberland House was pulled down, he considers that the general effect of this great open area has in more than

one way been damaged by the removal of this historic mansion. The huge Grand Hotel and other buildings at the commencement of Northumberland Avenue have dwarfed the Square, and though a direct way to the river has been thrown open which has been a great boon to the public, yet instead of a pleasing outlook in that direction, the principal object is the Charing Cross railway bridge and the perspective of a row of stately modern buildings leading up to it. Though the old mansion was not earlier than the Jacobean era, it had at least some savour of antiquity about it which London could ill afford to lose, considering the rarity of such at the present day.

There can be no question but that the Strand is about the most interesting and important thoroughfare in the Metropolis, owing to its unique position, skirting the banks of the Thames on a high level above it, and therefore the southernmost great street on the Middlesex side of London. Whilst not a striking thoroughfare architecturally (though it possesses several buildings of merit) the slight bends in it are of value, and prevent it having that monotonous appearance which some other great London roads have. There is another characteristic feature in the Strand—the sharp incline of the streets out of it to the north, and the steeper descents towards the river. How well the writer remembers, as a boy, the awe with which he witnessed the disappearance of some waggons down that gloomy cavernous arched opening just west of the Tivoli, which had the appearance of going into the darkness of the bowels of the earth, instead of into the vaults, or Adelphi arches. The widening of the Strand on the south side, opposite the Hotel Cecil, independent of the partial relief to the traffic it will afford, will also give that kind of refreshing feeling of repose induced in any busy important street by a little square or enclosure opening out of it, something to make a break of a quiet sort, quite different from that of an intersecting busy street.

But something better than this is wanted on the south side of the Strand, between the Adelphi Theatre and St. Clement Danes; only commercially it perhaps would not exactly pay, because what the writer wants to see is some fair-sized open "square" or oblong, as that to the Hôtel Cecil, with a garden in the centre and buildings on either side, with the exception of that towards the river, on the Strand level of course. It should be like a terrace with a balustrade to give a view of the river, and so let in some fresh air to the Strand. This is no new idea of the writer, nor does he believe it to be an Utopian dream; but it has occurred to him again and again, when travelling outside an omnibus, how charming are the momentary peeps of the running stream, with sailing barges, or maybe steamboats, that can be seen on a fine clear day when passing Savoy Street, Norfolk, or Arundel Streets, with the wooded Surrey hills in the horizon, and the Crystal Palace on its high perch. The rise on the way from Westminster Bridge up to the Charing Cross South-Eastern terminus is so gradual that it is only when nearing Trafalgar Square that there is any noticeable incline. Therefore many people fail to realise what a great advantage it is for many reasons to get up on this higher level. Why not make better use of it? Even from a purely commercial motive only it is worth while rendering London more attractive to foreigners, who come over here in much larger numbers than was formerly the case (notably from the other side of the "herring pond"), and our great city has a much finer river, with higher banks—on one side, at any rate—than the Parisians have in the Seine. But the inhabitants of the Metropolis would very soon avail themselves of such a boon as has been pictured, even though it were destitute of a band, refreshment pavilion, or any other like special attraction. Look at Leicester Square and other small open spaces where the public have free access, but no distant view or any other special advantages beyond the many comfortable garden seats, which in fine summer weather are always fully occupied with contented people. Of course, the only obstacle to the writer's proposal is the great cost. But Leicester Square was "lifted out of the mire" and brought into its present condition by the action of one man, and at his sole expense. So there is no reason to despair about a greater undertaking of this kind being accomplished under the auspices of some wealthy philanthropists.

(To be continued.)

## CELTIC INTERLACED ORNAMENT.

BY THE AUTHOR OF "CHARLES LOWDER."

IT is well known that the intricate and beautiful designs generally called "Celtic interlacing work" are used with endless variety on all remains of ancient Irish art, whether in stone, metal-work, or illuminated manuscripts. A remarkable discovery of the principle underlying all such designs—the foundation on which the ancient artists invariably worked—has recently been made in Ireland.

Let me begin by saying that the greatest living authority concerning Celtic art and history, Miss MARGARET STOKES, has proved that the notion which so long prevailed, that the interlaced work which marks early Christian art in Ireland originated there, "must be for ever abandoned." "Certain varieties of such designs," she adds, "were developed in Ireland, and if they were to appear in any part of the Continent . . . it would be on the tombs of the founders of Irish monasteries on the Continent. . . . But these Irish varieties *do not appear* on the tombs of COLUMBAN\* and his followers at Bobio. The interlacings on the marbles are in no way different from those which overspread Italy in the period of Lombardic-Romanesque architecture, before the sixth and seventh centuries. It would be difficult to prove that any such designs prevailed in Ireland before the seventh century. They are not found on pre-Christian remains in that country, although they are in Italy. They appear to have been gradually introduced into Ireland along

Of some of these, in the "Book of Kells," one of the greatest treasures in Trinity College, Dublin, Mr. J. O. WESTWOOD says:—

I have counted in a space scarce  $\frac{3}{4}$  of an inch in length by less than  $\frac{1}{2}$  an inch wide, no fewer than 158 interlacements of a slender ribbon pattern, formed of white lines edged with black ones. The invention and skill far surpasses all found in ancient manuscripts by continental artists.

WYATT says that he attempted to copy some of these ornaments, but broke down in despair.

A glance at the magnificent reproduction of the lovely gold chalice discovered in Ireland about twenty-five years ago would do more than pages of writing to convey some notion of the exquisite use of this art, and also of enamel, in gold work. This replica of the ancient chalice is always on view, under a glass case, at the entrance to Mr. JOHNSON'S shop, Grafton Street, Dublin, and ought not to be overlooked by visitors to Ireland.

Everything is pressed into the service of this decorative work, even eight human figures, of which the thirty-two limbs form the interlaced work filling the panel to be decorated; but there was evidently some underlying and never-failing principle forming the basis of every pattern, however intricate, which had not been grasped even by those most devoted to Celtic art.

At a meeting of the County Kildare Archæological Society, the late Father DENIS MURPHY, S.J., in giving a description of a beautiful pastoral staff which was exhibited graphically interlaced his fingers and said that when such

FIG. 1.

FIG. 2.

with Christianity at a time when this style still lingered in the south of Europe."†

This ornamentation may therefore be called Italo-Bizantino, or Lombardic-Romanesque, since, in the periods so termed by authorities on the history of Italian architecture, "interlaced bands, knots and other designs which we are accustomed to call Irish and Celtic are of frequent occurrence, and in places whose history is not connected with that of any Irish missionary we know of."‡ It is found, in precisely similar designs to those abounding in Ireland, on a door of San Clemente, at Rome, A.D. 650; on a balustrade of the ninth century of Sta Maria in Trastevere, and on many fragments preserved in the Lateran and other museums.

There is no doubt, however, that when introduced (probably in the seventh century, and by pilgrims returning from Rome) into Ireland, this special character of decoration was there developed in an extraordinary manner, with the utmost ingenuity, and by artists whose subtle sense of beauty brought the art to wonderful excellence, especially in golden chalices and ornaments, and in illuminations.

\* The famous Irish missionary Bishop in Gaul and Italy. He died A.D. 615, and lies entombed in the church of St. Columban, Bobio (near Piacenza), in a richly-carved marble sarcophagus.

† *Six Months in the Apennines*, pp. 11, 12. George Bell & Co., 1892.

‡ *Ibid.* p. 5.

like was found in ornamental work it might be taken as Irish; and Italo-Bizantino decoration, to which, as we have seen, the Irish belongs, has been described as "interlacings which have all the character of basket-work:"\* but in examining numberless varieties of these interlacings, the law governing designs, at first sight apparently irregular, eluded the students.

To take as an example one of the most beautiful specimens extant of the "endless-ribbon pattern" in a panel on the Cross of Tuam (fig. 1).

This is composed of one or more ribbons without ends, interlaced so as always to cross under and over alternately. If, beginning in any corner or any spot, the pattern is traced with a pencil, it will arrive back at the starting-point, the whole of the ribbon having been marked; and it will be found that, while the latter seemed during the tracing to wander in apparently the most reckless and aimless way about the surface, it had really arranged itself into an intelligible and orderly pattern devoid of repetition, but containing a general harmony throughout—one knot or twist balanced by a corresponding though totally different one; while all through the bands cross one another alternately under and over, without a single break. What was the key to this symmetrical variety? I must give in his own words the account of the remarkable discovery made by Mr. COOKE TRENCH,

\* *Six Months in the Apennines*, p. 6.

while building on his demesne in the county Kildare a church which he had determined should be Irish from foundation to roof. He sought everywhere for examples of interlaced work to use in decoration, but finding only a small number available for the spaces into which they were to be introduced, he was led to consider whether it was not possible to produce new patterns of the same character which could be exactly adapted to any given surface. He says, in a paper read before the County Kildare Archaeological Society in 1894:—

What I thought beautiful patterns grew up under my hand, but always, just as I was bringing one to a finish, some fatal crossing appeared, and the whole was a wreck. It was plain that there was some fundamental principle which, if one could only grasp it, would leave the rest easy. I consulted every authority that I could get hold of, living and dead. Even Miss Stokes could throw no light upon it. The librarian of the Royal Irish Academy produced volumes which touched upon the question, but without solving it. If an elucidation of this mystery is to be found anywhere, I thought, it will surely be in O'Neill's "Irish Crosses." But there I only found what I have quoted, that the art had declined and perished. I was driven to the conclusion that it was a lost art. Suddenly, one day, it flashed upon me what the underlying principle must be. I tested it, and found it work.

To explain the process in a few words. The artist first covers the space to be decorated with lines crossing one another, and woven in and out like basket-work. Fig. 2 gives the plain basket-work that formed the foundation of the pattern on the Tuam Cross (see fig. 1). He then proceeds to join all the ends two and two together.

FIG. 3.

In fig. 3 is shown by dotted lines the manner in which this is done. Finally, the artist obliterates crossings here and there, joining the ends thereby set free in a manner differing from that which they originally followed. A glance at fig. 4 will make this process clear. It will be seen that it is a tracing from fig. 3, except that the crossings

FIG. 5.

obliterated in the completed design are shown by faint lines, while the subsequent joinings are shown by dotted lines. If this be now compared with fig. 1, it will be seen that the design is the same, and that we have easily and exactly followed the method by which the artist, between

one and two thousand years ago, turned the simple basket-work of fig. 2 into the elaborate and beautiful decoration on the Tuam Cross. Every knot, every winding is there, and it is all one ribbon. We are thus brought back to Miss Stokes's description of the architectural decoration

FIG. 6.

which overspread Italy in the Italo-Bizantino and Lombardic-Romanesque period as "interlacings which have all the character of basket-work."

The Tuam Cross pattern was intended to fill a square or oblong, and the foundation of it was, as we have seen (fig. 2), composed entirely of straight lines. But this

FIG. 4.

special kind of decoration is also well adapted for circular spaces. We give a specimen of the work, drawn by Mr. TRENCH to illustrate the paper read by him on the subject (fig. 5).

FIG. 7.

In the foundation for this pattern there is not a single straight line. It consists of two concentric circles and four ovals (fig. 6).

It is notable that while in the completed oblong pattern (fig. 1) the greater part of the original foundation remains, it is so much obliterated in the circular pattern that it is not

easy to perceive the process by which fig. 5 has grown out of fig. 6. It will, however, be seen at once by a glance at fig. 7, where, as before in fig. 4, the portions of the foundation obliterated are shown by faint lines, and the subsequent joinings by dotted lines.

If the faint lines be entirely erased the exact pattern of fig. 5 remains.

Yet, as Mr. TRENCH remarks, "anyone can join the ends, anyone can obliterate crossings, but the excellence of the patterns consists in the skill with which these processes are carried out, and herein lies the art." The excellence attained in the incomparable ancient specimens remaining of this art do indeed show skill, but also something far higher—that delicate sense of beauty, that indescribable touch of the true artist's hand in expressing it which satisfies us perfectly with his work.

It is possible that some possessing this rare gift may use the discovery which has been made to produce decoration as lovely and as varied as that of old; but for this a master's hand is needed, and the instinct of poetic genius. No knowledge of the rules of metre in poetry, or skill in using them, would have given "Rose Aylmer" or "Auld Robin Gray" to the world.

### ARCHITECTS AS AGENTS.

BY A BARRISTER.

THE architect or engineer is the general agent of the building owner for all purposes necessary for designing, obtaining tenders for, and superintending the buildings or works upon which he is employed. This authority is implied from the mere fact of his appointment, and from common knowledge as to the nature of an architect's business. No particular form of appointment is necessary, and the retainer may, with two exceptions, be either verbal or implied, from the acts of the parties or the circumstances of the case. If the agreement is one which is not to be performed within the space of one year from the making thereof, that is, is incapable of being completely performed within a year, it must be in writing. And if the architect is retained by a corporation, the agreement must be under seal. Where the work is to be performed under the direction of an architect to be appointed by the employer, the appointment of such architect is a condition precedent to the liability of the builder to commence his work; and if the architect is not appointed within a reasonable time, the builder may be released from his engagement to do the work.

The architect or engineer is the general agent of the building owner in making drawings, but he has no authority to warrant to the builder that they are correct, or that the work can be executed according to them, nor when there are omissions from them to order those omissions as extras under a power to order extras, if they are works indispensably necessary to complete the contract. Nor where the drawings are impracticable has he any authority to order as an extra, work necessary to make them practicable.

Where an architect is engaged to superintend the erection of works he becomes the agent of the employer generally for all purposes within the contract connected with the erection of the buildings, and the ordinary rules as to the rights and duties of agents of a general character, and having a recognised apparent authority incident to their character, will be applicable. His authority may be either expressly given or inferred from the acts of his supposed employer. But where the limits of the architect's authority are clearly set out by express terms in the agreement between the employer and the builder, the authority must be strictly followed, as an employer will not be liable for the acts of the architect unless the authority be duly pursued by him. At the same time, the Courts are so far liberal in construing authorities given to agents that they will hold them to include permission to use all necessary, or even usual, means of carrying the main intention of the principal into effect in the best manner. In an agreement by an architect on behalf of his principal for building a house, &c., the principal will be bound, although no specific contract be proved, so that the general authority be sufficient to comprehend the terms of the agreement.

Mere instructions to prepare plans do not give the engineer or architect any implicit authority either to

negotiate for advances with a view to building, or to get tenders or estimates. In such a case the architect or engineer is not an agent at all, but a skilled draughtsman instructed to do a specific work. Even when he is given authority to get tenders this does not extend beyond a power to invite tenders and to charge the employer with any expenses necessarily or reasonably incurred for that purpose. Sometimes the architect will, more or less distinctly and expressly, mention to the employer the necessity of a quantity surveyor, and then the employer may be liable by an express or tacit assent or ratification. But sometimes the architect, without saying anything about it, or receiving any authority from the employer, engages a quantity surveyor. The authority of the architect for so engaging a quantity surveyor must, therefore, be an implied one—implied either by custom, necessity, or the circumstances of the case. This authority has more than once been implied when the employer authorised the architect to obtain tenders. The authority of the architect to employ a quantity surveyor to supply quantities may also be implied from the knowledge of the employer that they will be supplied, and by the employer standing by and saying and doing nothing, or by ratification. Sometimes the architect himself takes out the quantities, being a quantity surveyor as well as an architect. It is doubtful whether an architect has an implied authority either from custom or agency to take out the quantities himself for the purpose of obtaining tenders, instead of employing a quantity surveyor. If he has implied authority it could only be to take out the quantities and charge his employer. The authority of the architect to employ a quantity surveyor to measure up, whether by custom or the necessities of the case, so as to render the building owner liable to pay the quantity surveyor's charges, may be negatived by the terms of the employment of the architect. These terms may be defined by a special contract between him and the building owner. And if the architect's duties are to measure up, it seems clear that he has no authority to employ a quantity surveyor to perform his duties, except at his own expense. A usage that the building owner should pay the quantity surveyor, contrary to the terms or construction of the contract of employment of the architect, would not be valid, for extrinsic evidence of custom and usage is only admissible to annex incidents to written contracts in matters in respect to which they are silent. The authority of the architect to measure up is implied, in almost every building contract, from the fact of his having to certify for payment, which he could not do without measurement; but whether the architect has a right to charge for this measuring up must depend upon the terms of his employment with the building owner.

Authority on the part of the engineer or architect to dismiss the contractor cannot be implied, and must depend on the special terms of the building or engineering contract. An architect or engineer has no power to render the employer liable to sub-contractors by ordering sub-contractors to do work not included in the general contract, nor by entering into subsidiary contracts with them, either for the original work or for deviations. An architect has no general authority to dispense with, waive, vary or alter the conditions of a building contract. His duty is to see that it is faithfully fulfilled according to its terms; but it may be varied by the parties themselves, who are entitled to strict compliance therewith, or by the architect under special authority given him on that behalf. He has no power to bind his principal by representations varying the contract, and where a contract has been reduced into writing, a party thereto is not authorised to rely upon the statements of the agents of the other party to the contract varying or modifying its terms. It is, therefore, useless for a builder to attempt to contradict or vary the contract by proof of statements or representations made by the architect that certain of the written terms would be varied or waived. The builder's only remedy in such cases is against the architect. And this is especially so when the employer is a municipal corporation. An architect cannot order or certify for extras without special authority. No authority to increase the cost of a building can be implied from the submission to the employer of a design, unless the employer knows, either necessarily from the character of the design or by being so informed, that it is a departure from

the original plan or contract, and will increase the cost to him.

Where an architect, according to the terms of the contract, has authority to certify for payment during the progress of the works, either in certain sums or to a certain proportionate value of the work done and no more, if he exceeds that authority, (1) the certificate will be bad, (2) the employer will not be compelled to pay, and (3) the architect will render himself liable to an action by the employer for negligence if the employer acted on faith of the valuation and did not use his own judgment. A final certificate of an architect or engineer is binding between the employer and the contractor, but the architect as a professional man will be liable to his employer for negligence in making the certificate, and may be sued for any amount which he has over-certified.

Architects entrusted with authority involving a trust or discretion cannot delegate it to another without a special authority to do so, as expressed by the maxim, "Delegata potestas non potest delegari." But this rule must be distinguished from cases where he does not so much delegate his agency as exercise a power impliedly contained in his appointment, in doing which he must act with precaution, and not exceed what is proper under the circumstances of the case and warranted by usage. An architect might be justified in retaining a surveyor to take out quantities, but he could not delegate the whole of his duties.

#### INSTITUTE OF ARCHITECTS OF IRELAND.

THE annual general meeting of the Royal Institute of Architects of Ireland was held on Christmas Eve at 37 Dawson Street, the president, Mr. Thomas Drew, R.H.A., in the chair. Mr. Albert E. Murray, hon. sec. A.R.H.A., Fellow of the Institute, presented the annual report.

Mr. Geoghegan moved the adoption of the report, which was seconded by Mr. Millar.

Mr. Parry spoke of the injustice under which architects suffered by the employment of unqualified persons. It was desirable that the Local Government Board should see that plans for any of the buildings promoted by them were signed by properly qualified architects, especially on sanitary matters.

Mr. Murray endorsed all that Mr. Parry had said.

Mr. Ashlin also spoke, and the report was then adopted.

The auditor's report, which was adopted, showed that there was a balance of 85*l.* 14*s.* in hand.

The President said that the strike in the building trade in Dublin had probably postponed or diverted away for ever building investments to the value of not less than 100,000*l.* in the Dublin district, and the loss of wages payable for skilled labour throughout the long wasted summer had not represented less than 50,000*l.*

The balloting for Council and officers for 1897 resulted in the re-election of the President, hon. secretary and treasurer. The Council is as follows:—Messrs. Callaghan, M'Carthy, Mitchell, Ashlin, Carroll, Geoghegan, Parry, Pentland and Fennell.

#### SCOTTISH SCULPTURED STONES.

AT the last meeting of the Scottish Society of Antiquaries, Dr. Joseph Anderson communicated notices of some recently-discovered inscribed and sculptured stones. The first was a cross bearing a runic inscription, discovered near the east end of the old church of St. Peter's in Thurso, which was sent for exhibition by the directors of the Thurso Museum. It is interesting as being the only runic inscription hitherto discovered on the northern mainland within the old Norse Earldom of Caithness. The inscription is defective at the commencement, part of the base of the shaft of the cross being wanting. It bears some one (name wanting) made this overlay, after (or in memory of) Ikuib, his father. The cross was found lying on the top of a stone-lined grave, and this circumstance may explain the unusual formula of the inscription, calling it an "overlay." The second was an incised slab, with symbols and an ogham inscription, found on the links of the Bay of Keiss, Caithness, and preserved at Keiss Castle by Mr. Barry, M.P. It bears on the upper part the symbol of the fish, beneath it an ornamented symbol like a book-cover, and at one side an ogham inscription consisting of a few letters only, which Lord Southesk and Rev. Dr. Joass agree reading as probably a proper name, but the concluding part of the inscription is wanting. This is the second symbol stone found on the links of Keiss Bay, Mr. Barry having given the one first found to the National Museum of Antiquities. The third was a portion of a sculptured slab with part of an ornamented

cross-shaft found in digging a grave in the churchyard of Murroes, Forfarshire, and preserved by the Rev. James Nicol. It bears an elaborately executed panel of interlaced work of serpents in relief and a figure of an animal such as usually appears on the sculptured stones of Scotland. The fourth was an incised symbol stone at Pabbay, in Barra island, discovered some years ago by Father Allan Macdonald, and of which a photograph and rubbings were now exhibited, which had been taken last autumn by Mr. Erskine Beveridge, F.S.A. Scot. The stone shows the lily-like symbol and the symbol of the crescent crossed by the double sceptre, and over them a cross-potent, an unusual association. The fifth was a very interesting portion of an erect slab or cross-shaft found in the island of Canna, near the well-known cross there by Mr. Thom, son of the proprietor of the island. Of this stone photographs and rubbings obtained by Mr. Erskine Beveridge were also exhibited. It bears on one side the lower part of the figure of a man with a serpent entwined round his legs, and on the other sides panels of elaborate interlaced and serpentine ornament. The sixth was a cup-marked stone at Drumfours, Leochel Cushnie, Aberdeenshire, of which a photograph was sent by Rev. G. Williams Thornhill, F.S.A. Scot. Some markings on one side of the stone thought to be oghams are considered doubtful.

#### GLASGOW ECCLESIOLOGICAL SOCIETY.

THE Glasgow Ecclesiological Society met on the 22nd ult. in the studios of Messrs. Stephen Adam & Son, Bath Street, to hear a paper by Mr. Adam, sen., on "The Methods of Mediæval Glass-Staining." There was a large attendance. Mr. John Honeyman presided, and among others present were Bishop Harrison, Rev. Dr. Marshall Lang, Rev. Dean Reid, Rev. Dr. King, Mr. Campbell Douglas, Mr. M'Gregor Chalmers, Rev. Mr. Miller (Bluevale) and Rev. David Watson. Mr. Adam referred at the outset to a paper which he had read in Park Church some time ago, in which he described some Mediæval work, and gave his views on the motives of its producers, and proceeded to criticise some modern church work. Time would not change his opinion of what he then described as the pure devotional feeling of earlier aspirations in art-work as compared with our too often sophisticated imitations of it in modern times. The causes of the decadence were not far to seek. We wanted a living faith and earnestness in all that we attempted towards the beautifying of the house of God. He somehow thought we had too many facilities with present surroundings and up-to-date inventions that tend to the producing of immature and unthoughtful work in church-decorating in window and wall. We were too comfortable in all about us, too luxuriant in exuberance of material. We were puzzled and bewildered by the plethora of art literature and lectures. Within the past fortnight he had listened to lectures by friends of the Philosophical Society. Their remarks gave him pleasure, though they did suggest that his art, to put it mildly, should take a back seat. There was much truth in what he heard. He would maintain, however, that but for the mellowed and enriched light which stained-glass was so capable of giving—how without it would the modern over-stencilled kirk interior look? The mural decorator had much to thank the glass-stainer for. So had the architect. Many criminalities in colour, form and cheap chiselling acquired borrowed plumes, subdued richness, by the glorified light of the glass-staining art. Mr. Adam afterwards described the methods of glass-staining, and gave a brief history of the art. In conclusion, he said that one hope he entertained for the improvement of the still undesirable state of things in connection with the embellishment of our modern churches lay in some endeavour being made by that and kindred societies to resuscitate, to restore, those ancient trade guilds of art-craftsmen under the banners which master and apprentice ever strove to honour by honest work. The craftsman then did much for the Church and church art. But for the noble efforts and the inherent love evinced by the trade guilds of Glasgow towards the defence of the cathedral it would, in the troublous time of long ago, have been effaced. The Church had ever its glorious function and pre-eminent duty towards its omnipotent Head and to suffering humanity, and yet without lowering of its blessed aims, and seeing that merely literary societies had been successfully established in ecclesiastical centres, why, under its patronage, should we not have a guild for the training of our youth in the "beauty of form and colour?" Was it so remote from the beauty of holiness? Let our youth be taught to detest ugliness in material as well as moral form. There would be something ennobling indeed in a pastor and his people taking a keen, intelligent interest in the adorning of a sacred building which, by association and many sweet communions, had become precious to them. Among the examples of church work shown by Mr. Adam, and in which the members were much interested, was the Lady Boswell memorial window now being executed in the studio, and which is to be erected in Auchinleck parish church.

## NOTES AND COMMENTS.

It is remarkable that the first substantial memorial of the late WILLIAM MORRIS should be a small labour church in Leek. He was not a church-goer and probably he would not be satisfied with the title selected. Indeed, it has been found strange by others "that Pagan MORRIS should give the name to a church." The labour church is an old building surrounded by tall trees; it has high back pews and can accommodate from 200 to 300 people if so many admirers of the many-sided man and his doctrines can be found in the district. Mr. LARNER SUGDEN, architect, is the treasurer, and he offered to pay for decorating the building if it were allowed to bear WILLIAM MORRIS'S name. As a result, the walls are being lacquered a rich red with stencil ornaments in colours to designs contributed by Mr. WALTER CRANE. The ceiling and overhead beams, as also the barred sash windows, are finished in pure white and the woodwork painted a translucent green. The west and south upper windows are draped with Morris blue velvet fabric. Gifts of embroidery, &c., have been received, and Mr. STEPHEN WEBB is emblazoning a pair of silk banners with quotations from MORRIS'S works.

THE Architectural Association of Ireland is now constituted, and the president, Mr. R. CAULFIELD ORPEN, has delivered his address. He was not able to hold out many hopes to the members. In Dublin, as elsewhere in Ireland, the people are indifferent to art in all forms, and so long as there is such general apathy architecture cannot flourish. Mr. ORPEN said there were many disciples of the beautiful in the arts, but he contended that in the mass they gave little encouragement to truly artistic work, which could only be brought into existence and nurtured to a vigorous reality by the patronage of an artistically-minded and discriminating public. The President hoped something might be done by the new Association to overcome the evil, but the prospect is not encouraging when the chief anxiety of clients is to have contract plans prepared in a week or two. Yet large sums are expended in Ireland on building. It is uphill work to persuade clients that the showiest structure is not the most architectural; but happily there is the consolation that Ireland is not enclosed by the brazen wall which Bishop BERKELEY suggested, and England and America offer opportunities enough to able architects. Dublin has, too, the advantage of models which are well worthy of study. The late Sir SAMUEL FERGUSON did not exaggerate when he said:—"We live in Dublin in the midst of great but unnoticed beauties; if our Custom House stood on the Grand Canal at Venice we should soon see something in the windows of our photographers that would strike every eye as a novelty. All our works of that period are those of an intellectually advanced and intellectually consistent people, and no better answer could be given to those who make the charge of tameness and monotony against Regular art than the variety, the freedom and yet the fitness, strength and dignity of the public buildings of Dublin of the last century." The members of the Irish Association should often think of what they possess.

ONE of the first buildings in Rome which the lover of paintings was expected to visit was the Palazzo Sciarra. The collection was not confined to Italian masters. Of late years the princely owner has found himself in a position which made a sacrifice of his pictures a necessity. Hence it was that RAPHAEL'S *Violinist*, which is by some believed to be a portrait of TEBALDEO, was secured by Baron ALPHONSE DE ROTHSCHILD for 30,000*l.*, with the *Bella of TITIAN* for 24,000*l.* and the *Modesty and Vanity* by LEONARDO DA VINCI, or his pupil LUINI, for a similar sum. PERUGINO'S *St. Sebastian* was also sold to the Louvre for 6,000*l.* CARAVAGGIO'S *Gamblers*, which is probably his masterpiece, was parted with for 2,400*l.* The Italian Government could not be indifferent to transactions which were contrary to law, and proceedings against the Prince were commenced. But a compromise is arranged. Prince SCIARRA has agreed to make over to the Government the following works:—GIOTTO'S *Life of Christ*, a small work, one of GUIDO'S *Magdalens*, SCHEDONE'S *Arcadian Shepherds*, ANDREA DEL SARTO'S *Blessed Virgin*, *St. Joseph and St. Peter*, DA CARPI'S *Pico transformed* and *Vestal carrying a Statue*,

GAGLIARDI'S *Church of the Gesù*, Rome, JOHN BELLINI'S *Virgin and Child*, a *Vision* by an unknown master, BRONZINO'S *Etienne Colonna*, besides some examples of ancient sculpture. In return the Prince can dispose of the remaining works, which include some paintings of the Flemish and French schools and by Italians of the Decadence.

THE late EDWARD HARGITT, R.I., the landscape-painter, was one of the most enthusiastic of English ornithologists. His paintings represented scenes in all parts of England, Ireland and Scotland, and there is little doubt that if he differed from most landscapists in not restricting himself to one region, it was partly owing to the desire to obtain new specimens of birds or eggs. It is satisfactory to learn that the Trustees of the British Museum have secured Mr. HARGITT'S collection of birds, which contains the finest series of woodpeckers in private hands, and in certain respects surpassing the national collection. The number of specimens of this family alone is close on 3,600, including all the valuable types described by Mr. HARGITT in his "Catalogue of the Woodpeckers"; and there are also 2,000 miscellaneous birds, a large proportion of which will be most useful for the exhibition gallery. It is a pity there is not a British Topographical Gallery in existence, for a large number of Mr. HARGITT'S landscapes in oils and water-colours would be available for it, and would be no less attractive than his birds will be in the Natural History Museum.

THE most precious collections of French amateurs sooner or later find their way to the Hôtel Drouot. Those formed by the Brothers DE GONCOURT are no exception. For many a year JULES and EDMOND spent their happiest hours in amassing drawings by French masters, memorials of French actresses, rare etchings and Japanese productions, all of which it was expected would one day belong to the French people and help to keep the memory green of two men who were covetous of fame. But next month all the objects which became as it were parts of the beings of the DE GONCOURTS will be dispersed. Owing to the character of the "lots" it has been decided to sell those constituting a variety of art by themselves. In consequence, no less than seven catalogues have had to be prepared, which seem like handbooks to special departments of a museum. Some of the friends of the brothers have undertaken the duty of writing introductions to the series, but they may not be able to persuade bidders to become liberal. The GONCOURT dramas were always failures, and the same fate may await their treasures. The drawings by masters of the eighteenth century are, however, likely to find many wealthy amateurs ready to take part in the contests for their possession.

NEW YEARS parties in jerry-built houses involve many risks. Sometimes ceilings fall and contusions occur to lightly dressed ladies, or a board gives way and sprains follow. Accidents of the kind during the festive season, with bursting pipes and stopped-up gutters, help to keep busy those suburban builders who profess to execute repairs with despatch. The judgment which was given by the Master of the Rolls and Lords Justices LOPES and RIGBY in *LANE v. COX* minimises the responsibility of owners in such cases. The plaintiff was engaged in August last to remove furniture from a cottage, and the stairs gave way under him and his load. He was injured, and brought an action against the owner of the cottage, but was nonsuited. Their lordships on the appeal held there was no contractual relation between the parties. The defendant had not entered into any contract with the plaintiff. There was no duty upon a person not to let an unfurnished house in a rotten condition. Any such obligation must depend upon express contract. It was but a short step from that to say that if the landlord owed nothing to the tenant he owed no duty to strangers. There was, therefore, no duty on the part of this defendant towards this plaintiff, and there could be no negligence, and the nonsuit was right. It follows from the judgment that guests who may be injured in a private house cannot expect to receive a financial remedy from the owner of the mansion. Whether in such a case they can look to the tenant, their host, need not be considered.

## THE EXCOMMUNICATION OF KING ROBERT.

THE event which M. JEAN PAUL LAURENS has depicted exemplifies the power of the French clergy in the beginning of the eleventh century. ROBERT II., who was known as the Pious, the Wise, the Honest, was the son of HUGUES CAPET, who was the first of the third race of French kings, a race that was afterwards divided into three branches, viz. the Capetians, the Valois and the Bourbons. ROBERT II. was associated with his father in ruling about the year 988. In 996 he ascended the throne and held possession of it until his death in 1031. As a king he was disposed to be peaceful, and he patronised art, science and literature. His fondness for religious exercises gained for him the title of "le Pieux," and he could be considered as a faithful son of the Church. Some of the Latin hymns still in use were composed by him. Unfortunately, ROBERT married his cousin, the Burgundian princess BERTHA, without a dispensation, and by so doing had offended against the laws of the Church. Efforts were made to induce King ROBERT to abandon the princess, but as he declined he was excommunicated by Pope GREGORY V. In those days a formal act of that kind was a terrible calamity. As the painter has suggested, it signified the desertion of courtiers and other attendants from a king; their apprehension of a similar fate overcame their loyalty. For it was prohibited to have any relation with an excommunicated man or woman, to salute them, work with them, pray with them, dwell with them, or eat with them:—

Si pro delictis anathema quis efficiatur,  
Os, orare, vale, communio, mensa negatur.

A few exceptions were tolerated—servants could show fidelity to a master, a vassal to a lord and a subject to a king, but apparently King ROBERT was not fortunate in his retainers, or he was not among the favoured to whom lenience was allowed. It was with difficulty he was able to obtain food in his palace. With the country in a disturbed state government was difficult, but it could not be carried on while the king was treated as if he were more to be abhorred than a leper. Necessity compelled him to submission and he abandoned his wife.

BERTHA was replaced by CONSTANCE OF PROVENCE AND ARLES, a beautiful but despotic princess. The new queen was no helpmate for ROBERT. There was no sympathy between them. Her whole life appeared to be occupied with an endeavour to ruin him, and it is said she incited her sons, while they were still young, to conspire and head a civil war with that object. ROBERT found it so difficult to control his own household, we need not wonder if he refused to give way to ambitious projects and declined the emperorship as well as the sovereignty of Italy. Knowing how precarious was the tenure of his kingship, he arranged for the crowning of his second son HENRI I. against the wishes of CONSTANCE, who preferred to see her youngest and favourite son, ROBERT OF BURGUNDY, ruling France. The joint sovereignty lasted until 1031, when ROBERT the Pious died in his sixtieth year. King ROBERT deserves remembrance as a great church-builder. If we believe LE VIEIL, the author of "L'Art de la Peinture sur le Verre," it was during ROBERT's reign that the art of glass-painting was first exercised in France. All that was attempted is likely to have been the production of a transparent mosaic or a sort of marquetry in glass. From what is known of him, ROBERT, if he lived in a peaceful time, might have gained renown as an agent in the civilisation of Europe, for, in spite of civil wars, his subjects had reason to regret his death.

M. JEAN PAUL LAURENS is esteemed by his countrymen as their foremost historical painter. He confines himself to subjects derived from French history. The long period from the Merovingian kings to the Revolution is almost as familiar to him as the present century, for he has studied not only the histories and memoirs but the archaeology of each of the centuries. He prefers the tragic scenes, and leaves to others the task of painting life as if it were a series of comedies. In all his works the artist's conscientiousness is apparent, but what is seen does not reveal the immense labour which M. JEAN PAUL LAURENS imposes on himself before he attempts to place his visions of the past on canvas.

## EATON HALL, CHESHIRE.

IF any residence in England deserves to be called a palace of art, it is Eaton Hall, near Chester, which is occupied by the Duke of WESTMINSTER. His Grace is not content with having about him evidence of the antiquity of the GROSVENORS. He appears to be more anxious to make it apparent that he is a representative of the nineteenth century, and is as much moved by modern influences as any private gentleman among us. In many of the honest endeavours to make the world better, the Duke of WESTMINSTER takes a prominent and efficient share. As art has become a force it is represented in and around Eaton Hall in the worthiest way. Not only painters and sculptors have contributed to the adornment of the place, but we can there see examples which show those variations of architecture which are the tokens of the changes which English thought and taste have undergone, since the Duke of WESTMINSTER inherited the responsibilities which are attached to a position which can help to mould the future by the influence exerted in the present time, and which draws inspiration from the past.

## LINCOLN CATHEDRAL—VIEW FROM THE SOUTH-WEST.

THE view of Lincoln, in which the cathedral appears to domineer the city, is not to be effaced from the memory. Many artists have endeavoured to represent it. Even the late JAMES FERGUSSON, who was not much impressed by the sites of English buildings, was forced to acknowledge that "Nothing can exceed the beauty of the outline of Lincoln, as it stands on its cliff looking over the Fens." Illustrations of the interior of the cathedral are given elsewhere and they will be followed by others in succeeding numbers. Lincoln Cathedral is only the first of a series which we trust will enable people who have not studied ecclesiastical architecture to realise the present state of all parts of the treasures which are national property. The controversy about Peterborough Cathedral suggests that much ignorance on the subject prevails, and there is no more efficient way of removing it than by revealing the countless details of the buildings on a scale which will enable their beauty to be appreciated.

## SKETCHES AT HOME AND ABROAD.

THE views we now publish are derived from pages taken from a pocket sketch-book by Mr. HERBERT RAILTON, an artist whose development can be followed in *The Architect*, and, we may add, with advantage to every young architect who will make the attempt. The principal difference between the early and the more skilled work of Mr. RAILTON is that in the latter mass receives attention primarily rather than detail. The sketches, in fact, express the impressions which one of the busiest artists of our time has educated himself to receive. In them there is no working-up; what is felt at the most receptive moment is honestly and promptly recorded, and becomes the basis for later treatment. Mr. RAILTON does not enter into competition with photography, which can give detail with a fidelity it would be waste of time for the hand to compete with. What he supplies is something beyond the power of any scientific process to render, and that is the effect which can be produced by a building on a very susceptible and original mind, which has been strengthened by the severest training. The sketches may be only hurrygraphs, a sort of artistic stenography or confidential memoranda, but they are original in their aims, and as revelations of individuality they have the same character as the studies of great masters in painting and sculpture. They are invaluable as indicating one of the stages in the process of representing a building as a work of art by means of another work of art.

**The "Architect's" Cathedral Series.**—As many of our subscribers who have seen proofs of the plates of the series of English cathedrals, which are about to be published, have expressed a wish to keep them separately, arrangements have been made to issue special portfolios for that purpose. If the plates appear crushed from passing through the post office, it is easy to restore them by damping them on the back and passing a hot iron over the surface.

## LINCOLN CATHEDRAL.

WHEN VIOLLET-LE-DUC, as a representative of his countrymen, renounced all claim to a share in the design or execution of Lincoln Cathedral he must have suffered for the loss. "Thou, Lincoln, on thy sovereign hill," as WORDSWORTH apostrophises it, would be an honour to any race of builders. But the French architect acknowledged that he had failed to discern any trace of the French school either in the general design or in the details. The construction, he said, is English, the profiles of the mouldings are English, the ornaments are English, the execution is to be credited to English workmen of the beginning of the thirteenth century. The indebtedness of England to

France for all the best ecclesiastical buildings of the Mediæval period is firmly believed by French architects and archæologists. To conclude that one of the noblest examples was constructed without any direct intervention of French artists was, therefore, a sort of sacrifice to truth which needed resolution as well as honesty in whoever offered it.

VIOLLET-LE-DUC depended for evidence upon the character of the work in the building, and he might also have considered that the selection of so excellent a site, which makes the Minster appear to dominate the city and the Fens, was also a sign of that love of the picturesque which was more common in England than in France. But if he had considered the history of the cathedral he would have

Photographed by S. B. Bolas & Co.

CHAPTER-HOUSE, LINCOLN CATHEDRAL

found that Lincoln in its administration was as closely connected with France as any of the other English bishoprics. It was easy for VIOLLET-LE-DUC and foreign archaeologists to imagine that the district of Lincoln would be one of the last refuges of the Saxon, where the Normans were long in gaining a footing, and therefore primitive customs long prevailed in it; but the creation of Lincoln as a see was the work of the Conqueror.

There is no doubt an ecclesiastical district existed of which the Roman Lindum Colonia formed a part; but it seems to have been ruled from Stow, where is still a very interesting church. Owing to the invasions of the Northern rovers the bishops were driven inwards, and at the time of the Norman invasion Dorchester in Oxfordshire, instead of

Stow, was the residence of a prelate whose see extended beyond Lincoln. When he died, soon after WILLIAM'S coming, his office was bestowed on a little almoner from Fécamp, one of the speculators who had helped to subsidise the invaders, and who was known as REMY or REMIGIUS. He had his chair carried to Lincoln, and on the highest spot, near where a castle was being erected, he commenced the erection of a cathedral. Whether he endeavoured to make it correspond with the eminence of a priest who, as the ruler of the largest diocese in England, had become one of the foremost dignitaries in Europe, is not known. The size of the building can only be conjectured. Whether the cathedral was large or small, REMIGIUS was able to impart some of his own energy to the builders. In

*Photographed by S. B. Belas & Co.*

ANGEL CHOIR (PRESBYTERY, OR LADY CHAPEL), LINCOLN CATHEDRAL.

seven years it was ready for consecration. The date was fixed for the ceremony and clergy and laymen arrived to witness it—for it was the first which took place under the new rulers. But the Spirit who says "Come!" and who is no respecter of persons or events, had called REMIGIUS. The crowds found they were to be present at a funeral instead of a consecration. The parts of the first cathedral which have remained reveal that it was of the severest and plainest Norman. There was apparently no time to cut mouldings or chamferings, and in fact the mere shell of the building was all that REMIGIUS's expedition could raise. If, as some archæologists believe, the west front, or it may

be the veiled part, dates from his time, it affords by itself an idea of the aims of Lincoln's first bishop.

His successor, Bishop BLOET, apparently was not zealous about the building, but ALEXANDER, the third Bishop of Lincoln, was one of those men who are sure to find in the newest building opportunities for alterations. A fire which occurred in 1141 and destroyed the whole of the roof enabled him to introduce stone vaulting throughout the building. He also constructed the three doorways in the west front and the lower parts of the towers, his masonry being more finely jointed than that of REMIGIUS.

In 1186 another Norman, called HUGH OF AVALON, a

TRIFORIUM, ANGEL CHOIR, LINCOLN CATHEDRAL.

Carthusian, afterwards known as St. HUGH, was consecrated bishop. In the year preceding an earthquake had destroyed a large part of the cathedral, and left the remainder in an unsafe condition. HUGH appears to have bravely encountered the difficulties which awaited him. He spent some years in making arrangements and providing materials. A change had taken place in architecture, and the style adopted by Bishop ALEXANDER was as much out of date as that of Bishop REMIGIUS. HUGH OF AVALON was enabled to obtain the aid of GEOFFREY OF NOYERS as "constructor ecclesie" to prepare plans in the new style, the beautiful Early English, which must have seemed at the time to have been an inspiration from heaven.

It is rarely the name of a Mediæval architect has come down

to us, and GEOFFREY or GODFREY deserves to be honoured. But it is commonly assumed he was one of the Normans who made of architecture a close profession for their own benefit. There is, however, reason to believe he belonged to a family that was over a century settled in Lincolnshire. Although of foreign origin he has as much right as his building to be considered English. Unfortunately for his reputation hereafter, the architect, although nearly eight centuries have elapsed since he worked at Lincoln, by his masonry excited the anger of Professor WILLIS, who can only regard him as "a crazy Frenchman!" He is therefore severe on GEOFFREY's shortcomings and grudging of praise to his skill. "I can trace," said the Professor, "his eccentricities through every part of the building which he erected, from

*Photographed by S. B. Belas & Co.*

LESSER TRANSEPT (SHOWING CLUSTERED AND CROCKETED COLUMNS), LINCOLN CATHEDRAL.

the floor to the vaulting. His double arcades were a great conceit, and his octagon shafts, with their detached shafts around them, introduced one of the most serious difficulties which the Dean and Chapter had to contend with in the repair of the cathedral. Yet, with all his oddities, GODFREY hit on occasional beauties; and the noble pier column, with the crockets between the detached shafts and the main pier, is one of the best of its kind in England." One consequence of Professor WILLIS's judgment is that it inspired the late Sir GILBERT SCOTT to take a similar view. In one of his Academy lectures he said:—"The subject of puzzles in vaulting suggests a notice of that of the choir at Lincoln, where the architect seems to have put himself out of the way to make an easy matter difficult; for instead of groining his oblong bays in the usual way, he has made each cell strike obliquely to points dividing the central ridge of the bay into three equal parts; so that neither the cells nor the diagonal ribs from either side ever meet one another, but each cell is met by an intermediate or an oblique transverse rib from the opposite side." SCOTT was, however, compelled to acknowledge the beauty of the architect's work and to express a wish that similar craziness and eccentricity were more prevalent in England. There is apparently no example of Gothic emancipated from Romanesque or other detail to be found at so early a date as we can see it in the choir at Lincoln. If more height had been given to the vaulting the work would be still more effective.

Bishop HUGH set an example to the amateurs and craftsmen of his diocese. He aided in the work by acting as a humble labourer, and was proud to carry stones and mix mortar for the masons. The character of his work in the choir suggests the enthusiasm he inspired, and is thus described by JOHN HENRY PARKER:—

Nothing can well exceed the freedom, delicacy and beauty of this work; indeed, there is an exuberance of fancy which leads us almost to think that the workmen ran wild with delight, and it became necessary to sober them down and chasten the character of the work afterwards; for instance, in the double arcade which covers the lower part of the walls there is a waste of labour, which is avoided in the subsequent work of the nave without material injury to the effect. In the early work there is not only a double arcade, one in front of the other, but in some parts there are actually three shafts in a line, one in front of the other, so as only to be seen sideways and with difficulty; this arises from the vaulting-shafts being brought in front of the double arcade. The foliage of the capitals is exquisitely beautiful, and though distinguished technically by the name of "stiff-leaf foliage," because there are stiff stalks to the leaves rising from the ring of the capital, the leaves themselves curl over in the most graceful manner, with a freedom and elegance not exceeded at any subsequent period. The mouldings are also as bold and as deep as possible, and there is scarcely a vestige of Norman character remaining in any part of the work. The crockets arranged vertically one over the other behind the detached marble shafts of the pillars are a remarkable and an uncommon feature, which seems to have been in use for a very few years.

St. HUGH was not destined to see the completion of the work which he had commenced with fervour. He died in London on November 17, 1200, when only the choir with the chapels on its eastern side and a part of the great transept were ready for use. His body was brought back to Lincoln, and buried in the east part of the church above the high altar. King JOHN helped to carry the coffin. Mr. FERGUSSON considers that we owe to Bishop HUGH the first perfect vault in England, which was constructed by the masons of Lincoln not necessarily in the Burgundian manner; "but in that form with which they were conversant from their practice in erecting smaller side vaults."

Another HUGH (DE WELLES), who occupied the chair for a quarter of a century, dying in 1235, is supposed to have had much of the nave constructed, with the chapels on the north and south sides, besides the chapter-house and the Galilee porch attached to the western transept. At his death he left to the cathedral one hundred marks, besides all the timber he possessed throughout the diocese.

Bishop GROTESTE followed. He belonged to the humblest class of the people, but, as often has happened in the Roman Church, his origin helped him to advance. He was no respecter of persons when duty was to be supreme. LINGARD says that "Neither pope nor legate could prevail on him to give institution to foreign clergymen presented to benefices in his diocese. When the nuncio sent him a provision by which FRÉDÉRIC of Louvain, the nephew of

INNOCENT IV., was promoted to a prebend in the church of Lincoln, GROTESTE replied, in language singularly energetic, that the provision was contrary to the good of the Church and the welfare of souls; that he would not consider it as emanating from the pontiff, and that he should never deem it his duty to carry it into execution." He had used similar language before the Pope at one of the councils, and he appears to have succeeded in establishing reforms. He held the see of Lincoln for eighteen years. It is as an intrepid reformer and writer he is known, rather than as a builder. All the work that can be assigned to his episcopate is the rebuilding of the central tower, which had fallen during one of the canon's sermons.

The crowning work of the interior, the beautiful "Angel Choir," which the late Professor PALEY described as "the most perfect structure, both within and without, in England," was commenced in 1255. In order to erect it a part of the city wall was allowed to be removed. It was not completed until 1281, when the body of St. HUGH was deposited in it, King EDWARD I. and his Queen, the princes and all that was greatest in England taking part in the ceremony. As a work of a later time it necessarily differed from the style introduced by GODFREY OF NOYERS; indeed, RICKMAN includes it among examples of the Decorated period, but remarkable skill is seen in the avoiding of contrasts that would be too pronounced. It is not everywhere the transition is so finely graduated. The thirty figures of angels on the spandrels are, according to the late Professor COCKERELL, the work of English sculptors, and are among the most successful Mediæval examples.

The cloisters, which date from 1296, show more definitely that the Decorated period had commenced. To the fourteenth century the west windows belong and some of the chapels, but what is most interesting in Lincoln Cathedral may be attributed to the men who lived in the thirteenth century.

## ARCHITECTS AND ELECTRIC LIGHTING.

NOW that electric-lighting is a well-established fact and no longer an experiment, one is often inclined to ask why it is not more universally adopted in England. This brings us at once to a question of national characteristics which may equally quickly be put aside. We all know the Englishman's aversion to anything new, and his cautiousness in committing himself to any venture that his more volatile neighbours have not already adopted with success. In fact, he is naturally "close" where his own interests are concerned.

As this is, however, no new question, but one that has been proved many years ago, there must be other causes which determine our comparative inaction in the adoption of this very necessary means of illumination—causes which might be dealt with *ad infinitum* by the electrical engineer who has come into contact with the vestryman, the town councillor, the building committee or the private householder. And these causes in the end all resolve themselves into the question, "What will it cost?"—i.e. one of money. The point now arises, "How far can the architect assist in making the electric light more popular?"—not in the way of pulling the chestnuts out of the fire for the electrical people, but in working harmoniously with them in considering the possibilities of the electric light from an artistic and scientific standpoint; in beautifying his interiors by working in the lighting as a part of the decorations; in actually and directly cheapening the cost of first installation and in providing against excessive depreciation and repairs by insisting on the carrying out of a first-class job to begin with.

For it must be conceded that the architect has not yet grasped the possibilities of electric lighting and its importance as a part of his whole building. He turns the question over to the man who will do it for the least money, and takes no further responsibility in the matter. The work is outside his pale altogether; the clerk of works will have nothing to do with it, unless it be to obstruct the wiremen, who, it may be at once admitted, want very little encouragement to scamp a job. The mistake made by many architects is that they know certain firms who always do their plumbing work or supply gas-fittings; and when these firms wake up one morning to discover that they are full-blown electrical engineers, our archi-

tect accepts them as such, provides them with a schedule of lights to quote to, and invariably accepts the lowest tender without troubling to inquire whether the material even will not cost more than the price tendered. We all know the result. If the firm find they are losing money they scamp the work, and the architect is not one whit the wiser.

The object of this article is to attempt to indicate some ways by which good electrical work may, by the help of the architect, be made obligatory and at the same time cheaper.

Now, if a householder is asked why he does not adopt the electric light, his answer is sure to be that the installation is too expensive and inconvenient. He does not always want to re-paper his walls, or have his cornices spoiled or his floor-boards ripped up. All these objections are valid and the things complained of are unpleasant. But they may be greatly modified by making certain provisions in designing and building a house which is certain, sooner or later, to be fitted with electric light. Now if we ask what provision does the architect make for electric-light runs in building a house, the answer is "None."

In wiring a house the first thing that is looked for is an easy run for the rising mains; sometimes a casing for gas and water-mains is found running right up the house; more often than not there is no room in this casing for electric-light mains, more frequently still there is no such casing at all. Then an unsightly electrical casing, sometimes a foot wide or more, is run up some wall of the house. The same may be said about circuit mains, there being no provision of any sort for hiding runs.

All this might be improved if the architect would recognise the claim of electric light. When he designs the house, would it not be desirable for him to provide casings from basement to attic? Or in default of this, to build a galvanised iron pipe—diameter in proportion to the probable number of lights—into the wall, with a break at each floor between floor-board and ceiling level? This would avoid any cutting away of plaster if the house is wired at any future time, and materially cheapen labour.

Again, consider the unnecessary time occupied in taking up floor-boards for wiring a room below. If the boards are tongued and grooved, the expense is very great and the final appearance of the floor is not good. Now, as ceiling lights are nearly always in the middle of the room and brackets are fed from the side, would it not be possible for the middle board on every floor to be screwed down? Also, if all the boards were stopped off at the last joist but one and the remaining space boarded over by boards running at right angles, or with the joists and supported on bridge pieces—all boards at the skirtings being screwed down—it would then be possible to run casing all round the room under the floor, by merely unscrewing the boards round the walls. This is no doubt heretical and quite contrary to recognised principles, but it might be considered. Skirting-boards again give a lot of trouble if they have to be taken down, because they are sprigged on, and very frequently are split by careless joiners. Why should not these skirting-boards be screwed down, the heads of screws being countersunk and puttied over? Parquet flooring is another stumbling-block to wiremen. If the usual herring-bone or lozenge pattern were stopped—say, two blocks' width from the skirting, the space being then filled up with two rows of blocks running straight—the taking-up and making good would be a much simpler matter. These and many other small points should suggest themselves to architects when designing a building; they should bear in mind that electric light will ultimately be adopted, and make the necessary provisions for the same, so as to cause their clients as little inconvenience and expense as possible.

We may next consider what should be done when it is decided to adopt the electric light immediately the house is built, *i.e.* what is then the best system to adopt? There are many systems of wiring, but roughly these may be divided into two, *viz.* surface work and hidden work.

Now, it is obvious that the best system is that which will give the least trouble in the end, no matter what it costs in the beginning; but the public do not always look at it from this point of view. The surface system of wiring is undoubtedly the cheaper in either a new or an old house, but decidedly so

in the former, because the making-good follows as a matter of course. But for that very reason it is more expensive in cases of repairs, extensions, &c., because it always necessitates the presence of the decorator.

On the other hand, the hidden system, when once installed, gives no further trouble as regards repairs, because new wires may be drawn in at any time without disturbing the decorations. It is also possible to adopt the hidden system in an old building, but this—although the best, if the client will pay—is expensive, as all the walls have to be chased to let in tubes. (Sunk casing is not considered here, as being out of date.) Now, there is no reason why, if gas and water-pipes are put out of sight, that electric-light wires should not be equally hidden; that architects are only now beginning to recognise this is however a fact. Look where you like, in town halls, banks, churches, private houses and anywhere, you will see the walls disfigured with hideous casing, with no attempt at arranging the same artistically even, so as to conform with the decorations. That this is often, in fact usually, the fault, not of the architect, but of the owner or a building committee of Philistines cannot be denied, for the architect is frequently not consulted in the matter. All the more, therefore, where and when he has a chance he should use his influence to make a good job of the electric light.

Now, casing may be worked into the decoration of rooms in a most artistic manner, if a little thought and trouble be only given to the question. If on the walls, it may be worked in with oak or other dados, with mouldings for friezes or with panels, and on the ceilings it can be laid out in lozenges or any form desirable. In some country houses this is occasionally done; but how often, after awarding the contract, does the architect trouble himself to see that the same is artistically carried out, not merely thrown on to the walls?

There are also other means by which an appearance of neatness may be attained, especially where the building is not new, and it is desired to avoid much cutting away. All the runs under the floors may be in casing as usual; but drops to switches, plugs, or brackets are run in round—or, preferably, half round—brass tubing, secured to the wall by neat clips, and subsequently carefully painted the colour of the wall-paper. The half-round tubing is especially to be recommended because it is hardly visible, and if run down corners of chimney-breasts, or along door or window architraves, is not noticed at all.

To return, however, to the hidden system of wiring. This is now rapidly coming into use, but, unfortunately, the main principle is lost sight of in the attempt of everybody to have a different system of details; for example, galvanised iron pipe, iron pipe served with composition, compo pipe, brass pipe, compressed paper sheathed with brass, iron pipe coated inside with compressed paper, &c.

Now, what is required of these systems is cheapness, mechanical strength, incombustibility, facility for inspection and renewals, and insulation. The only system which conforms to all these qualifications is iron pipe pure and simple, with a proper system of draw and inspection-boxes, the whole either compounded or galvanised to prevent rust. This method is invaluable for public buildings, banks, insurance offices, &c., especially where there are mosaic floors and marble or tiled walls. Two large insurance offices in London have recently been completed on this principle, under the superintendence of a firm of consulting engineers who make this form of wiring a specialty, and also with the advice of the architect in this instance, and there is no doubt that in many other such buildings the same plan will be adopted.

For private houses this system may be worked very well in conjunction with brass pipe for small drops and casing under the floors, the iron pipe being used for rising mains. The brass pipe, being only half-inch, requires a very small chasing in the plaster, which can easily be made good with Parian cement, and, if the house is not new, by a strip of wall-paper of the same pattern as the rest, cut with jagged edges. Or if the wall be covered with Lincrusta, this may be cut with a sharp knife and pressed back for about an inch, being afterwards stuck down again.

In conjunction with these hidden systems, it is usual to sink switches and plugs flush with the wall, and a very nice effect is produced by covering the same with a carved wood or

embossed metal finger-plate, leaving merely the handle of the switch protruding, or in the case of plugs drilling two holes in the cover for the prongs to enter.

All these systems are, as has been said, relatively expensive for first installation, and this again raises the question of cost.

Now the gullibility of the British public is extraordinary, especially on a point of this sort; and if a man asks for tenders for wiring his house and gets sums ranging from 15s. to 30s. per light, he will usually accept the lowest tender after receiving an assurance by the firm tendering that he will have the very best work and material—in fact, as good in every way as that offered for the highest price, which latter was going into the pockets of the tenderers as 50 per cent. profit.

This is the ordinary bourgeois way of asking for and accepting tenders when the architect does not appear. But when an architect does the same thing, what are we to think? Especially if he is building a house for a rich client—say for 10,000l. or upwards—it is idle to state that the owner will not pay—say 200l., or only 2 per cent. of the cost of his house—to have his wiring done properly, *i.e.* by a responsible and well-known firm acting under expert advice. Instead of this some young gentleman goes down to see the house, where he is taken round by the owner's wife, who settles the positions of lights, &c., with the result that the house is often ridiculously overlighted or underlighted. Furthermore, the question of fittings is also left to this lady, who chooses articles without any relation to their intended future environment, and with the sole object of having something different to that of her friends.

It is therefore just as necessary from the point of view of economy, safety and art, to see that this contract is properly carried out, and to have expert advice in the matter, as to see that a building contract is carried out honestly and to specification—for which purpose the architect has a clerk of the works. For the risks to life and pocket are just as great, and in time the bad work will have to come out if the house has not been burned down before.

Now when a man wishes to build a house he consults an architect, and when he wants his drainage repaired or extended he (if he is wise) consults a sanitary engineer. Also when he intends adopting the electric light he ought to have the advice of a consulting engineer, for just the same reason that he would not entrust the work before-mentioned to a builder without expert advice. And, just as this consulting electrical engineer would not, as a point of professional etiquette, think of getting out plans for the building of his client's new wing or even his engine-house (whatever ideas of architecture he might have), but would place his requirements for the due carrying out of such a building before his client's architect, so the best results would be obtained if, when a building were to be lighted by electricity, the architect would advise his client to call in an expert on electric lighting and illumination, so that the two may consult as to the best methods to be adopted—the consulting engineer on the system and quantity of illumination, the architect on the means to facilitate the due carrying out of the work, and the difficulties to be overcome in the way of runs—after the scheme of distribution has been submitted to him.

This state of things may seem rather utopian—the lion lying down with the lamb—but it has been done before, and there is no reason why it should not be done always to the confusion of the absurd jealousy that undoubtedly exists between these parties and also between their respective employés.

In conclusion, whether these last suggestions be adopted, or the architect undertakes to provide for and see to the work himself, the point must not be lost sight of that there is as much cutting, scamping and jerry-work in the electric-lighting trade as in the building trade. But whereas the latter is usually only due to excessive competition, the former is frequently due to gross ignorance and carelessness, by people who have had little or no scientific and commercial experience, and who are either drapers and ironmongers, or else young fellows straight from college who have never wired a house or employed a workman, but are subsidised by their fathers, and who will quote any price so as to get a job. People of that class are the enemies to the industrial progress of electric lighting; they not only eventually find themselves in the courts, but also injure and discredit the trade they are engaged in by

shaking people's confidence, and driving them to the incandescent gas light.

These are the sort of firms that the architect should beware of, and for this reason some of the afore-mentioned suggestions are made in the hope that, by recognising electric lighting as separate from architecture, by providing for its claims, and by entrusting its execution to good people acting under expert advice, the architect will secure for his client an artistic, economical and first-class job.

## RENAISSANCE ARCHITECTURE IN ITALY.\*

IT would have been an advantage if Mr. Anderson's book appeared some thirty or forty years ago, when the Renaissance was, especially in architecture, supposed to be one of the pestilences which periodically afflict the human mind. The author has constituted himself a champion for the style, and in those days he would have found opponents as courageous as himself. In our time the coming and going of styles is considered as phenomena which, for all we know, may be inevitable. If we allow the existence of certain natural tendencies among men, and events which excite those tendencies, it seems to be inevitable that there must be a sort of game of see-saw in art—in which what is to-day looked down upon has a turn and becomes an object for admiration. Or we may describe the alternation as an ebb and flow which we are powerless to resist because they are in some way connected with the evolution which we are doomed to undergo. If, however, we can consider Mediæval architecture as a temporary diversion of the onward movement of art, then the Renaissance will be no more than a resumption of the former direction of a current in its true channel. That is the opinion which Mr. Anderson holds, and which he thus explains in the beginning of his book:—

The higher mental activity and adaptability of the Aryan race, joined to the disturbance caused by Northern Teutonic elements out of sympathy with the Roman, has brought about a more frequent and further divergence from the established type than anything in the history of Egyptian and Oriental art. The brilliant Mediæval or Gothic period in Europe is the most notable example of such divergence, ending as the strength of the Roman element in race, literature and sentiment asserted itself first in Tuscany, but involving the four corners of Europe in its rising flood. The Renaissance was, in fact, a reversion to type, if a biological expression may be applied in this connection without confusion; and this recurrence rather than permanence of type appears to be characteristic of European civilisation, so far as we have had experience of it in some 2,000 years. In this view of it the historical architecture of Europe is one complete whole to this day, its main characteristic features the combination of Greek column and lintel with Etruscan arch, pediment and dome. Its mouldings still show to trained eyes their wooden origins, though a stone character has been gradually impressed upon them. European architecture is a variety as distinct as the Egyptian or the Arabian, and in a corresponding degree a racial expression, pointing, if not to the identity of the origin of Romano-Germanic peoples, at least to their now essential unity.

The words we have quoted will by themselves be almost enough to suggest the aim of the author. He believes in the unity of the architecture of which the Renaissance was a phase, because it was the product of a race having common characteristics. Looked at in that way, Mr. Anderson believes that Italian Renaissance especially is no mysterious production; it becomes to him a mirror of contemporary life. As he says:—“By the operation of the universal law of natural selection it has registered the awakened enthusiasm of the time for what was glorious and beautiful in the ancient world, the enlarged consciousness, of its free-will, and the possibilities of human life and effort; while it records on the very face of it, so that he who runs may read, the habits of the people, the condition and nature of trades, commerce and arts, and the character and varying power of the governments of the Peninsula.” In the majority of books on architecture by English authors there is no such attractive promise held out to allure readers, but we should remember that Mr. Anderson's book originally was prepared in the form of lectures to students in Glasgow—a city where it is expected that a subject is to be proved to have a very wide circle of relations. Mr. Anderson is no compiler, he has studied the Renaissance buildings which he describes, and in criticising them it is evident he is not too submissive to authorities, but can think for himself. The book is evidence of the earnestness with which architecture is studied in the north, and it will exercise a beneficial influence on students.

CASTLE GROVE, HEADINGLEY, YORKS. THE DRAWING-ROOM MANTEL.  
*T. Butler Wilson, F.R.I.B.A., Architect.*

THE necessary legal notices have now been lodged for the introduction of a Bill next session to obtain powers for the compulsory acquirement by the Office of Works of all that suitable ground known as the Carrington House (Whitehall site) and of all rights in connection with it. The freehold of the properties on this site, says the *Standard*, are part of the hereditary estates of the Crown, and the select committee of the House of Commons which, under Mr. Akers-Douglas, considered the subject last session, reported at the end of July that it was, in their opinion, desirable to acquire the various interests in the property, subject to an actual or contingent recoupment of its value to the land revenues of the Crown. They advise the erection of the new War Office here, chiefly because the necessity of further accommodation has long been recognised as urgent, and because this site would be more quickly available than any other. They also regard its position, in respect of its contiguity to the new Admiralty and otherwise, as most practical and convenient. There is another point of view from which the site has claims upon public attention, namely, that it is part of the historical area of 24 acres which formerly constituted the so-called Palace of Whitehall, or as Philip II. wrote it in a despatch to Mendoza, "Huylal," whose isolated buildings, courts, squares and gardens stretched from the water-gates of York and other mansions on the river bank to the place now known as the Horse Guards Parade. The locality was formerly highly esteemed for its accessibility, and its capacity for architectural development is pointedly indicated by Inigo Jones's ambitious proposals to James I. for a royal residence. What was beyond the monarch's resources to build or to maintain is being fast realised by modern speculative enterprise, and the Carrington House site is to-day an island area surrounded by some of the finest modern edifices in the Metropolis. The dimensions of the property in process of acquirement, stated roughly, may be taken at 600 feet on its northern limit, which the roadway of Whitehall Place separates from some of the offices of the Woods and Forests, the house of the Ecclesiastical Commissioners and the southern frontage of the huge Hôtel Métropole. The eastern side, 450 feet long, is delimited by Whitehall Avenue from the gigantic towering pile of Whitehall Court, at the corner of which is the National Liberal Club. Its southern face measures 400 feet, including the now vacant space from which the famous Carrington House was cleared a few years ago. This face is

kept well apart from the mean buildings occupied by the Board of Trade and from the memorable banqueting-hall, the scene of the martyrdom of Charles I., by the recently opened road, called, from its particular location, Horse Guards Avenue. The western boundary, about 320 feet, is in Whitehall, on the route from Charing Cross to Parliament Street. In the centre of the plot is Middle Scotland Yard. The occupiers of tenements and offices, let or leased, in the existing congeries of houses who will be affected are the Gas Light and Coke Company, the Vestry of St. Martin-in-the-Fields, the Metropolitan Electric Supply Company, the London Electric Supply Corporation, the Charing Cross and Strand Electric Supply Corporation, the London County Council, the Chelsea Waterworks and the National Telephone Company. The committee's report does not finally deal with the question of increased accommodation for other Government departments; with other sites in Parliament Street, Downing Street and Spring Gardens; or with the public improvements with which they may hereafter be connected. But it advises a further reference to the committee when the subject is brought again before Parliament.

## TESSERÆ.

### Thirteenth-Century Gothic.

THE series of changes from the Early Romanesque to the establishment of Pointed architecture, and thence again to its final extinction, differs materially in the different countries of Europe; all however seem gradually to approach nearer and nearer to one another till towards the close of the thirteenth century, when all appear, though by different routes, to have arrived, in the main at least, at the same point; and though some differences still remained, as might be expected from slight varieties in climate and materials and local habits, the essential principles and elements of the style at that time were perfectly coincident with France, Germany and England. This coincidence, however, was of short duration, for from this point all again diverged, so that at the final extinction of the style its national varieties differed as widely as at its commencement. It is by no means self-evident that this coincidence of principles and details at one particular epoch is a proof of its being the culminating point in the style; it happens, however, to be the very point which, perhaps, the majority of those who have thought on the subject, judging only from æsthetic evidence, have selected as about the period of perfection; and if we must select a style other than a local one, an era of general rather than of national perfection, this period of coincidence, to say the least, comes in very conveniently as the only one which can be shown to be applicable to all the principal countries where the Pointed style prevailed.

### Contrast in Architecture.

To obtain the due effect of size the architect must study scale. He needs something to mark greatness by contrast. The pyramids seen in solitude appear much smaller than when surrounded by life and marking their real dimensions by contrast with the Arabs swarming over and upon them. A colossal statue in the same way gives no idea of its actual bigness until an ordinary human being is placed beside it. It then asserts its real importance, just as a great man stands out from among his fellows, because his actions are nobler and better than theirs. The Greeks did not erect large buildings because they did not require them, and their temples impress us rather as beautiful shrines for sculpture than as grand architectural monuments. The effect produced in the case of the Parthenon, for example, is by exquisite proportions combined with beautiful detail and not by size. The Roman architects, on the other hand, fully appreciated the value of this means of obtaining architectural effect. Large edifices such as the Coliseum were the fruit of their energies, and Rome, as the capital of the civilised world, became the centre to which all turned in art, as afterwards in religion and literature. The Roman Empire, extending from sea to sea, gave security to subject races and assured to them material prosperity. Architecture as an art of peace consequently flourished, and throughout the vast empire imposing buildings arose, such as temples, theatres and baths, while public works of utility, like aqueducts and roads, were not neglected. The Coliseum impresses us at least as much by mere size as by the beauty of its parts. These, indeed, are in no way remarkable, although from their frequent multiplication they give a value to the whole structure and supply the necessary measure by means of which its vastness may be appreciated. The great Roman baths are in too imperfect a condition to enable us to speak confidently of their original architectural effect, but from the remains that have been discovered, particularly of mosaics and sculpture, we have every reason to conclude that their vast size was not thrown away, as has been done at St. Peter's, but that details of moderate dimensions and statues but little exceeding the size of life gave that opportunity of comparison

which is essential to the architecture of a noble building. In the Middle Ages we find the same principle worked out and with even more technical skill. The builders of our cathedrals did not, indeed, aspire to the reproduction of the broad surfaces and spacious vaults of Imperial Rome. They sought to produce architectural grandeur rather by a repetition of parts than by any single exploit. Their works contained details of moderate dimensions often repeated. The effect of such multiplication of small parts is to give scale to the whole building and to make the latter appear larger than it really is.

### Antiquity of the Propylæum.

Students of Greek architecture have long been familiar with the fact that the entry to Greek sacred areas, such as the Acropolis of Athens and the domain of Demeter at Eleusis, was entered through a noble propylæum, of which the form is constant and fixed. The Greek propylæum consists of two porches set back to back, whereof one looks outward towards the outer world, the other inward towards the enclosure. At the common back of the two porches runs a solid wall with great gates. The construction combines, as do most Greek contrivances, great beauty with great convenience, since the two porches offered a pleasing shelter to those waiting for the doors to open, whether they wished to go out or in. Such is the fixed Greek custom, but it is not a little surprising to find a propylæum of precisely this kind guarding the entry to the upper Acropolis of Tiryns. This fact by itself seems to carry back the history of Greek architecture some centuries. Of course, though the essential idea is the same in the prehistoric as in the historic Greek doorway, the details differ. We should be disappointed if we sought at Tiryns the marble pillars, the sculptured friezes, the stone roofs which were the features of such propylæa as those of Pericles. At Tiryns there were pillars indeed, but they were of wood let into limestone bases, and the roofs instead of being slabs of stone or tiles, were almost certainly made of rushes covered with clay, after the fashion still usual in the East; but while materials change form persists, the idea takes a new expression but does not itself change.

### Influence of Stained-Glass on Oil-Painting.

Absolute opacity, to judge from the older specimens of stained-glass, seems to have been considered inadmissible. The window was to admit light, however modified and varied in the form prescribed by the architect, and that form was to be preserved. This has, unfortunately, been lost sight of in some modern glass-painting, which, by excluding the light in large masses and adopting the opacity of pictures (the reverse of the practice above alluded to) has interfered with the architectural symmetry in a manner far from desirable. On the other hand, if we suppose painting at any period to have aimed at the imitation of stained-glass, such an imitation must of necessity have led to extreme force, for the painter would set out by substituting a mere white ground for the real light of the sky, and would thus be compelled to subdue every tone accordingly. In such an imitation his colour would soon deepen to its intensest state, indeed considerable portions of the darker hues would be lost in obscurity. The early Flemish pictures seldom err on the side of a gay superabundance of colour; on the contrary, they are generally remarkable for comparatively cool lights, for extreme depth and a certain subdued splendour—qualities which would necessarily result from the imitation or influence in question.

### Buildings in Earthquake Countries.

The prescriptions which the architect has to follow in preparing his buildings to resist the strains of a moderate earthquake are simple, and do not require any great increase in the cost of construction. It is well to understand that the actual movement of the ground, even in violent shocks, is slight. In those which have been termed of the first order it is doubtful if the movement ever amounts to a foot in amplitude, and probably the shock only swings the earth to and fro within the space of an inch. The destruction is done in part by the suddenness of the to-and-fro motion, which breaks the foundation from the superstructure, but in larger measure by the pendulum-like vibration which is set up in the building. This pendulum movement may cause an oscillation of 1 inch at the foundations to be several feet in a sixth floor, or, say, 100 feet above the ground. The rending effect of this pendulum-like swinging, especially in weak masonry, may easily be imagined. Many well considered directions for the protection of buildings from earthquake shocks have been given. Of these the best may be found in the excellent work on earthquakes by Professor John Milne, late of Tokio University, Japan. From these directions we extract the following:—1. So arrange the openings in a wall that for horizontal stresses the wall shall be of equal strength for all sections at right angles. 2. Place lintels over flat arches of brick or stone. 3. Let all portions of a building have their natural periods of vibration nearly equal. 4. Avoid heavy-topped roofs and chimneys. 5. In brick or stonework use good cement. 6. Let archways curve into their

abutments: 7. Let roofs have a low pitch and their tiles, especially upon the ridges, be well secured. It is also important where the prevailing direction of motion of the shocks is known to have the blank walls of the house placed so as to be parallel to the course of the shocks. It is also worthy of note that generally hill-tops are more shaken than the ground at the base, for the same general reason that the upper part of a house swings more during a shock than the basement. Last of all, the higher the edifice the more risk of disastrous oscillation, and the more need of binding its parts firmly together.

#### Perronet's Method of Striking Centreing.

It is a delicate business to strike the centreing of bridges. Were it removed in an instant all would probably come down, for the arch-stones are not yet abutting on each other, and the joints in the middle are open below. Perronet's method appears to be very judicious. He began to detach the centreing at the very bottom, on each side equally, where the pressure on the centreing is very slight. He cut away the blocks which were immediately under each arch-stone. He proceeded gradually upwards in this way with some speed, till all was detached that had been put out of shape by the bending of the centreing. This, being no longer supported, sunk inward, till it was stopped by the abutment which it found on the arch-stones near the crown, which were still resting on their blocks. During part of this process the open joints opened still more and looked alarming. This was owing to the removal of the load from the haunches of the centreing. This allowed the crown to sink still more by forcing out the arch-stones at the haunches. He now paused some days, and during this time the two haunches, now hanging in the air, gradually pressed in toward the centreing, their outer joints closing in the meanwhile. The haunches were now pressing pretty hard on the arch-stones nearer the crown. He then proceeded more slowly, destroying the blocks and bridgings of these upper arch-stones. As soon as he destroyed the support of one, it immediately yielded to the pressure of the haunch; and if the joint between it and the one adjoining toward the crown happened to be open, whether on the under or the upper side, it immediately closed on it. But in proceeding thus he found every stone sink a little while it closed on its neighbour; and this was like to produce a ragged soffit, which is a deformity. He therefore did not allow them to sink so much. In the places of the blocks and bridgings which he had cut away, he set small billets, standing on their ends, between the centreing and the arch-stones. These allowed the pendulous arch to push toward the crown without sensibly descending, for the billets were pushed out of the perpendicular, and some of them tumbled down. Proceeding in this way, he advanced to the very next course to the keystone on each side, the joints closing all the way as he advanced. The last job was very troublesome, viz. the detaching of the three uppermost courses from the centreing, for the whole elasticity of the centreing was now trying to unbend and pressing hard against them. He found that they were lifted up; for the joints beyond them, which had closed completely, now opened again below; but this job was finished in one day, and the centre sprung up 2 or 3 inches, and the whole arch sunk about 6 inches. This was an anxious time, for he dreaded the great momentum of such a vast mass of matter. It was hard to say where it would stop. He had the pleasure to see that it stopped very soon, settling slowly as the mortar was compressed, and after one or two days settling no more. This settling was very considerable, both in the bridge at Neuilly and in that at Mantz. In the former, the sinking during the work amounted to 13 inches. It sunk 6 inches more when the blocks and bridgings were taken out, and one and a half when the little standards were destroyed, and one and a fourth more next day, so that the whole sinking of the pendulous arch was  $9\frac{1}{2}$  inches, besides what it had sunk by the bending and compression of the centreing. The crown of the centreing was an arch of a circle described with a radius of 150 feet; but by the sinking of the arch its shape was considerably changed, and about 60 feet of it formed an arch of a circle whose radius was 244 feet.

#### Mediæval Employment of Stone.

If the early Gothic builders used soft stones for their points of support (as they were often forced to do in default of finding others), they took care to leave them a great height, of course, for in this case soft stone is less liable to be crushed. As to hard stones and among others the thinnest, which are generally the strongest, they used these as ties, as lintels prolonged to connect distant piers with one another, and they formed the supports which were to carry a very heavy burden either by piling the stones one upon another, if the supports were very thick, or by setting them upright against their stratum, if the supports were very slender. With regard to these stones set against the stratum, we recognise all the delicacy of observation shown by the builders. They were not ignorant that stones set against the stratum are liable to split; wherefore,

they chose them with particular care with shallow, very homogeneous and very compact ledges, in the building stones at Paris, in the hard stones at Tonnerre, in Lower Burgundy and Champagne, in the small ledges of Upper Burgundy, hard as sandstone and without strata. Experience had shown them that certain stones that were hard and fine in grain, like the "Cliquant" and the small, hard ledge at Tonnerre, for instance, were composed of very thin courses of limestone set one upon another and united by a solid cement; that these stones through their very texture have, when set up against the strata, so to speak, an extraordinary strength; that they resist enormous pressure, and that when heavily loaded with a powerful weight they split less readily than if set on their natural bed, for what makes these stones split is the moisture which they secrete between their thin layers, and which causes the particles of marl to swell; now if set flat they are more apt to preserve their moisture than if set upright. In this latter case the water runs along their sides and does not penetrate the courses resting one upon another. As a proof of this statement we might cite a number of gutters, drip-stones and copings made of slabs of lias or cliquant set on their natural bed in very old buildings, and frequently found to be split; while the same materials in the same structure when set upright against the stratum are perfectly preserved and are injured only through accidents, like the oxidation of cramp-irons or gudgeons, or through some flaw. We should not omit here one important fact in the constructions of the Middle Ages, that the beds are cut with the same perfection as the facings to be left in sight, and that the stones are always set in a thick bed of mortar and do not have the mortar put in with a trowel, or poured in, which is worse.

#### NEWCASTLE SOCIETY OF ANTIQUARIES.

A MONTHLY meeting of the Newcastle Society of Antiquaries was held on the 23rd ult. in the Old Castle, under the presidency of Mr. Horatio A. Adamson, who read a paper on "Gleanings from the Records of the Parish of Tynemouth." The records, he said, went back to the seventeenth century, and treated of the stormy time of the Civil War; of parishioners going to the castle church in 1668; the building of a new parish church at the end of the eighteenth century; and the turning of the old castle chapel into a powder magazine in 1810. Referring to the longevity of vicars at Tynemouth, he remarked that the records showed that there had only been four vicars during the last 142 years. A vote of thanks was passed to Mr. Adamson for his paper.

#### GENERAL.

Sir E. J. Poynter, P.R.A., has consented to become a vice-president of the Society for the Encouragement of the Fine Arts. Lord Leighton and Sir John Millais were vice-presidents of the Society.

A Cathedral has been commenced in Bendigo from plans by Messrs. Reid, Smart & Tappin, of Melbourne. The contract for the first portion of the work, which is to be completed in three years, has been let to Messrs. T. Cochran & Co., of Melbourne, the amount being 31,000*l*.

Alderman Harding has offered to provide and erect in the City Square, Leeds, a bronze equestrian statue of the Black Prince, modelled by Mr. Thomas Brock, R.A., besides eight bronze figures to hold glow lamps.

The Work of M. Eugène Müntz, on "Florence et la Toscane," has been published by MM. Hachette & Co., of Paris and London.

The Exhibition of Paintings and other works by the late Lord Leighton of Stretton will be opened at the Royal Academy on Monday next.

The General Purposes Committee of the Metropolitan Asylums Board recommend that a Bill should be introduced in the next Session to enable the Board to raise money on loan for the purchase of a site and providing office accommodation on the Thames Embankment.

A Remonstrance expressing sorrow at the proposal to rebuild a portion of the west front of Peterborough Cathedral, the beauty and value of which it is impossible to over-estimate, is in course of signature. Among the artists whose names are appended to it are Sir E. Burne-Jones, Mr. Watts, R.A., Mr. Richmond, R.A., Mr. Onslow Ford, R.A., Mr. Holman Hunt, Mr. Walter Crane and Mr. Sargent, A.R.A.

A Landscape Exhibition containing works by Messrs. R. W. Allan, J. S. Hill, T. Hope McLachlan, A. D. Peppercorn, Leslie Thomson and E. A. Waterlow will be opened next week at the Dudley Gallery.

"A Pearl of Price," by Philip Skippon, a Puritan sergeant-major general, was exhibited at the last meeting of the Glasgow Archaeological Society. The copy, which is dated 1649, is believed to be unique, and belongs to the Mitchell Library, Glasgow.

# The Architect.

## THE WEEK.

THE action of Lord PENRHYN in dealing with the strike of his late quarrymen may cause many people to exclaim, "It is excellent to have a giant's strength, but it is tyrannous to use it like a giant." They should not forget that many employers of labour have long felt that without some decisive exercise of power the British workman will continue to feel that he is to be at liberty to paralyse industry according to his whim. The strike, which has reached so unfortunate an end, was not to have commenced until March next, whereas it has been in operation already for nearly three months. It is impossible to calculate the consequences of so long a disturbance. A large quantity of Penrhyn slates are used abroad, and several markets will probably be lost through the strike. If there is a return of buyers the conditions of supply will be embarrassing to the producers, for it is not to be expected that contracts for Penrhyn slates or for works on which they are to be used will be entered into without special conditions. It is also unfortunate that so little respect should be shown to the Conciliation Act. In the disagreement between the London and North-Western Railway Company and their employes, the interference of the Board of Trade, with the aid of the Act, was a national benefit, and in the much less important case of the Penrhyn quarries a satisfactory result was also to be anticipated.

THE report of Professor R. B. RICHARDSON, the director of the American School, shows that the excavations at Corinth in 1896 were of more importance than was supposed. They occupied nearly three months, and at times 100 men were employed. There was nothing but the ruins of a temple to suggest a place for operations. The first trench disclosed thirty-five Ionic columns used as foundations for a later building. In the second trench were fourteen rock-cut graves with skeletons in most of them, and many vases of common red ware. Twenty-one trenches were dug altogether; but it was not until the eighteenth was made that five flights of steps, innumerable lines of seat-foundations and two seats in position were found, indicating the Greek theatre, upon which had been erected a Roman theatre with seats of steeper pitch. In the upper part of the theatre were uncovered many terra-cotta figurines. Other trenches brought to light a huge drum and the broad pavement with a water channel on each side, these indicating the old agora or a broad passageway into it. The old temple is supposed to have been dedicated to APOLLO rather than to ZEUS. The chief find in sculpture was a group representing the youthful DIONYSUS between PAN and a nymph. Nineteen vases grouped about skeletons were also discovered. The vases are unbroken, of interesting shape and very primitive in appearance. The director suggests laying down a track and dumping-cars for next season's work at Corinth, and estimates at 5,000 dols. the cost of next season's excavations.

LAST week we briefly suggested to the students of the newly-formed Architectural Association of Ireland that they possessed in Dublin examples of architecture which merited attentive study. We are glad to find that Mr. THOMAS DREW, R.H.A., the president of the Irish Institute of Architects, in his address to the Association treated the same subject. He said he boldly maintained that for the study of architecture as a living art they had in Dublin remarkable advantages. Let them take stock of the gifts vouchsafed to them in the mere luxury of living in an old, historic city, with many dignified monuments of a past time, with a picturesqueness of architectural effect—spontaneous, unstudied; the growth of accidental creation, not made, as it was impossible to make it in a brand new town or city. Let them think what the difference would have been had their lot been cast as students in such new towns as Birmingham, Bradford, Leeds, Wolverhampton, even Manchester. Let them even take in his native city, Belfast. How much was there in the modern makings of such towns to inspire the architectural student with one spark of genuine enthusiasm

for the art of architecture as he went to his work in the morning and returned in the sunset effects of the evening. London had great wealth of noble and illustrative architecture, if the student could find it out—from its unmatched Abbey of Westminster, running through all the gamut of progression of styles of the Middle Ages, up to the grand chord of the Renaissance architecture in St. Paul's Cathedral, than which there were few more satisfying examples in all the world of Classic Renaissance architecture. In London the architectural student had the run of all that if he were appreciative and discriminating and lived on a bicycle. But the interests and objects were too widely apart and overflowed by a teeming modernism and a sordid flood of building of a greater modern city. Edinburgh had native charms to inspire the architect artist with a fire of enthusiasm in his daily life of going to and fro, such as he knew nothing to approach in all the lovely cities of these kingdoms. There was nothing of pictorial, theatrically-imagined architecte and aerially enchanted effect to be conceived like the picture of Edinburgh from Princes Street. Dublin might not afford exhaustive examples of every age and style, but he maintained that it presented examples which were wanted to illustrate methods of architectural study. The lecturer then spoke of the architects and architecture of the Custom House, the Bank of Ireland, the Four Courts, Trinity College, and of the residences of the Irish nobility and gentry in Dublin a century ago. Every English architect who has visited Dublin will agree with Mr. DREW. It is strange, however, that so little attention has been given to the buildings. But that may be caused by the remembrance that so many were designed by Englishmen.

M. ROLL, the French painter, who is equally successful with single figures in the nude and fêtes in which crowds take part, is commissioned to paint the laying of the foundation-stone of the new bridge in Paris by the CZAR. He has visited Russia in order to submit his sketches, and was received at the imperial residence, Czarskoë-Selo. This consists of several palaces, the principal being the "old palace," designed by STARELLI and CAMERON, and the Alexander Palace. In the old palace is a chapel, which is decorated by means of lapis-lazuli and gold. One room is covered with mother-o'-pearl, another with Chinese lacquer, a third with amber, a fourth with porcelain. In the picture-gallery there are several works by Dutch painters. The Alexander Palace contains several paintings of the Napoleonic campaigns painted by French artists. In the park is a Chinese theatre in form of a pagoda, a Gothic chapel, a Turkish kiosk, a hospital for invalid horses, a museum containing relics of NAPOLEON I., besides memorials to commemorate the history of Russia. A more diversified combination of architecture, painting and sculpture is not to be found in Europe.

As the opinions of Frenchmen are prized in America the *New York World* has obtained several *à propos* of the new year from representatives of politics, literature, science and art. M. BENJAMIN-CONSTANT, the painter, who has recently won golden opinions in the States, has offered a few axioms, which he entitles "Pensées de Peintre." They are as follows:—Art masters genius. Art without genius creates a pedant; genius without art creates a fool. The man who criticises always appears to know more than he who admires. It often happens that an artist who begins like a master finishes like a pupil. *A propos* of what is called "peinture littéraire," it may be said that nothing is less literary than the "Salon carré" (the treasury of masterpieces) in the Louvre. It is more easy to impart character by drawing than by colour. Drawing (*dessin*) may come from colour, but colour cannot come from drawing. Nature is invincible. The "thoughts" will suggest some of the qualities of M. BENJAMIN-CONSTANT's paintings. They are remarkable for colour, and it might be supposed that, as the artist has a gift for colour, so much effect was easily produced. But apparently he finds it as difficult to be a colourist as weaker men. His success has been mainly in representing incidents, but M. BENJAMIN-CONSTANT apparently longs for a time when form rather than subject will be attractive.

## THE LEIGHTON EXHIBITION.

IT is so commonly believed there is scarcely a painter who can sustain the test of an exhibition of all or most of his works, it is a wonder one is ever organised. But whatever may be said about the failures, it must be felt that the test is hardly fair. There, never was a painter, architect or sculptor who executed his works with a prospect of that kind in view. Artists, like the rest of men, must think of the present rather than of the future, and cannot enjoy the satisfaction of laying out a plan of life in which every creation of theirs is devised for a predetermined place. The works may be compared to tesserae, but when they are combined they cannot be expected to form a mosaic of a geometrical pattern, and much less a picture. As each one is generally executed without much concern about the relation to those which preceded or followed it, and has to be complete in itself, how can fifty or five hundred be expected to constitute a series that will have much unity, or be like the chapters in a book, which, however various, conduce to one end? When painters on principle limit their field, the sight of several of their works is as oppressive as those which are displays of versatility. ROSSETTI'S long-necked dames were found to be as monotonous as the numerous quadrupeds of LANDSEER which were endowed with an expression of more than human intelligence. But in spite of all those drawbacks "one-man exhibitions" are not likely to lose their interest.

It was anticipated that the late Lord LEIGHTON'S works were peculiarly unfitted to form a special exhibition. A painter cannot expect that everything he produces will be in eternal remembrance, and LEIGHTON'S style was associated mainly with his later works. They may be called neo-Greek, and the important decorative principle of repose is pre-eminent in the majority of them. They are illustrative of myths rather than of histories, but they are accepted as representing the spirit of Greek life. In looking at them it is difficult to resist the conclusion that in Greece the great aim of life was to become a model of deportment, and that some ancient TURVEYDROP, rather than the philosophers, or the moralists, or the heroes, was accepted as the expounder and representative of the Beautiful. A couple of pictures of sleeping or reclining beauties with Greek names were delightful additions to a summer show, but the prospect of long rows of them was not inviting, and there were misgivings about the exhibition which is now open.

Through the tact of the arrangers of the pictures, the exhibition is the most successful of its kind we have had in this country. If a chronological order had been adopted, or if LEIGHTON'S Renaissance or neo-Greek examples were placed together, more or less monotony could not be avoided. But by the judicious mixture of examples of various periods, any diversity of talent which the artist possessed is emphasised. LEIGHTON made many experiments in colour, but those seen in the Academy are generally found to produce an harmonious effect, just as if the decoration of the walls of the galleries had been contemplated by the artist.

There are over three hundred pictures and studies, besides some examples of sculpture. As five galleries are occupied it will be evident there is no crowding, and generally there is only one row of pictures. The study of the collection is, therefore, more easy than is usual with winter or summer exhibitions, and many visitors will, no doubt, be tempted to see the pictures repeatedly during the coming two months. They will be repaid for their labour by the pleasure received.

The examples of LEIGHTON'S art range from the *Cimabue finding Giotto in the Fields of Florence*, painted in 1850, when he was in his twentieth year, to the *Vestal*, *Bacchante*, *Fair Persian* and *Clytie*, which were left unfinished through his death. We have consequently examples which suggest the labour of nearly half a century. Happily, also, we see only evidence of growth, for not only are signs of decadence absent, but it could not be supposed that LEIGHTON had reached the full extent of his powers. His last works reveal that his spirit was courageous enough to undertake more daring feats in colour than were attempted when the painter was twenty years younger.

It is the progressive power which seems most striking in a journey through the galleries. His *Cimabue finding Giotto* is not remarkable, and gave no indication of the power seen in the large *Cimabue's Madonna carried through*

*Florence*. It surprised Academy visitors by its excellence in form and colour, as well as by the courage shown in presenting such a subject when the Ecclesiastical Titles Act had made people suspicious of Romanising agencies. But what is most remarkable about the picture is the novelty of the treatment. It appears to be inspired by the *Panathenaic Procession*. In the relief the Athenians have no spectators, but the seated Olympians. In the picture only a privileged few and DANTE are allowed to witness the ceremony. It might have been only a rehearsal within a sacred enclosure. If, however, we accept the tradition as recorded by VASARI, what was remarkable in the incident was the enthusiasm of the populace. "All the men and women of Florence," it is said, "hastened in great crowds to admire the picture, making every possible demonstration of delight," and the part of Florence where CIMABUE lived was called in consequence ever afterwards "Borgo Allegri." But of the popular delight the painter has taken no notice. In the Academy the *Procession of the Madonna* is faced by the *Daphnephoria*, painted twenty years afterwards. In it we see another event which gave rise to a public festival. But the Thebans are represented by no more than three or four little children, who are introduced to fill up a corner. It was a braver act to insist on his own principles of composition being paramount in 1855 than in 1876, regardless of the conviction of improbability which was sure to arise in the minds of spectators, and it was safe to conclude that LEIGHTON would henceforth be indifferent to many a convention. The *Salome*, of 1857, is not according to the Academic type, and suggests French influence. The *Mermaid*, of 1858, displays a passion in the sea spirit which was unfamiliar at that time, unless in ETTY'S works, and may have shocked good people—the Greek sailor being made lackadaisical as compensation. But the *Count Paris*, in which we see the visit of the suitor favoured by the CAPULET family to the chamber where JULIET is lying in the trance, suggests that LEIGHTON was not assured of his principles. In intensity it would pass for a specimen of pre-Raphaelitism. Some of the *dramatis personae* are evidently portraits, and of unhandsome people. The background, where several servants are seen carrying dishes for the bridal feast, is also remarkable as the work of the designer of the *Procession*. The *Roman Lady*, of 1859, is curious. It is evidently a portrait of some mocking dame, and on account of the expression must have been a novelty. It forms a strange contrast to the *Pavonia*, also of 1859, in which peacocks' feathers are introduced as ornament. The *Mrs. Sutherland Orr*, of 1861, is interesting from its unaffectedness; but another work of that year, a portrait of *Mr. J. H. Walker*, who is clad in a smock frock and is supposed to be playing on a shepherd's pipe, is as commonplace and affected as any portrait that could be found in a London exhibition. Too apparent are the signs that it was painted in England. The *Michel Angelo Nursing his Dying Servant*, which was painted in 1862, looks like a much earlier work, or the painter was temporarily retrograding. We doubt if any one of the students now in the Painting School would care to put his name on it, and the introduction of the mallet and chisel in the sculptor's hand denotes that slight regard was then given to probability. The *Star of Bethlehem*, of 1862, representing one of the Magi, who stands out well against the sky, observing the strange star from the terrace in his house, is excellent in design and colour. But why was it necessary to introduce a scene of revelry beneath the terrace, as if the star-gazer had shared in it? That might also be considered a pre-Raphaelite notion; and the figure of LEANDER under the *Last Watch of Hero* proves that LEIGHTON was not free from a belief in the advantage of a supplementary picture in 1887. All the paintings which belong to the first twelve years of practice are still remarkably vivid in colour, and appear as if they would outlast some of the works belonging to the last twelve years.

The *Eucharis*, of 1863, suggests a change. It is a painter's as distinguished from a sculptor's version of a canephorus, but is more English than Grecian in type. Belonging to 1864 (the year of LEIGHTON'S election as an Associate) is his *Golden Hours*, which has much more of the grand Italian manner than any of the other works in the collection. The man is of a refined type, with a head of black hair surpassing in mass any seen on a modern model; he is clad in black

and is supposed to be playing on a spinet. Only the back of the woman is visible, and she is clad in a white robe richly embroidered. It was self-sacrifice to refrain from painting a woman's face that would be comparable to the musician's, but this was another case of obedience to a self-imposed law. The *Orpheus and Eurydice* shows three-quarter figures somewhat larger than life-size. The two are modelled with an emphasis of the muscles which was disregarded afterwards, and the chiaroscuro is pronounced. The two pictures were superior to any produced since the *Procession*, and it was gratifying to know the painter was resident in England. In the following year, 1865, was seen the *David*, which was better suited to English taste. The Psalmist is seen seated on the housetop watching two doves, and is supposed to be exclaiming, "Oh, that I had wings like a dove!" But it must be said there is little power of characterisation in the figure, which appears to be taken from a model in comfortable circumstances; and not much disturbed about spiritual matters.

In 1866 LEIGHTON was in Spain, and in 1867 he visited the East for the first time. An increase of power is, therefore, visible in the works of 1867. The *Roman Mother*, a bust, is a portrait of one of those representatives of the ancient republic and empire which amaze visitors to Rome. A woman with such a head and neck should be capable of doing something sublime or terrible, and an American would allow she was as good a representative of "The Mother of the Gracchi" as Mrs. HOMINY of New York. The *Pastoral* is a shepherd and his lass, like DAPHNIS and CHLOE, engaged in performance on the pipes. The *Greek Girl Dancing* is another attempt to realise the past. A girl is posturing before two sunburnt men, who, in spite of their antique garb, are modern Spaniards. The original title was the *Spanish Dancing Girl: Cadiz in the Old Times*. The figures have more force than LEIGHTON commonly favoured. The *Venus Disrobing for the Bath* was the first nude figure on a large scale which the painter attempted in England. The goddess is removing the sandal, which is her last article of dress; but, as in the case of the antique statue, it is open to doubt whether the figure is not beginning to clothe herself. In modelling it is equal to any of LEIGHTON's more recent works.

The success of the neo-Greek experiments is suggested by the appearance of three works of the class in 1868. In *Ariadne Released by Death* we see a full-length of the hapless daughter, of MINOS, in white drapery, stretched on a bier at the sea-shore. It indicates that as yet the artist had not attained that esteem for beautiful lines which was afterwards to characterise him. In the small nude figure, *Actæa, the Nymph of the Shore*, and the *Acme and Septimus*, from CATULLUS, we have more attention to line. The *Dædalus and Icarus*, of 1869, is a masterpiece. There is earnestness in the figure of the artist, and enterprise in the look of the adventurer; but with those qualities there is fine colour and figures that are expressive of different ages of manhood. This work has masculine vigour, and testified that LEIGHTON's election as an Academician was justified. The *Helios and Rhodos* was also masterly in the contrast between the god and nymph. The abundant roses growing at the sea-shore are admissible for the sake of their colour. There was, too, a fine figure of *Electra at the Tomb of Agamemnon*, in which roses again appeared. The *Nile Woman*, a single figure bearing a pitcher, is the only work in the exhibition which belongs to 1870, but 1871 was signalled by *Hercules Wrestling with Death for the Body of Alceste*, and by a much smaller and quieter painting, *Cleoboulos instructing his Daughter Cleoboulina*. The *Hercules* is the most ambitious work of LEIGHTON's up to that period, and there are not many pictures in the world which present an equal number of difficulties which have been overcome. In the *Ariadne* he had depicted a dead body, and placed alongside it white drapery. In the *Hercules* he painted a girl that might be considered as dead, but "ere decay's effacing fingers had swept the lines where beauty lingers," a condition that was almost similar to JULIET's in the painting of the *Count Paris* already referred to. A strong contrast to the placid figure is presented by the *HERCULES*, who has seized by the wrists—

The poisonous impalpability  
That simulates a form beneath the flow  
Of those grey garments,

while around are figures of men and women who witness the struggle.

Close, each to other agonising all  
As fastened, in fear's rhythmic sympathy,

The "rhythmic sympathy" which BROWNING admired pervades the picture and extends to the sea. Even the trees have their branches lopped where they would interfere with the prospect. It was an unusual feat for the artist to attempt so much power in action, and he may have felt that so reposeful a subject as *Cleoboulos instructing his Daughter Cleoboulina* was a necessity after the exertion. The wise man who, with outstretched arm, teaches his child, it is evident did not despise a comfortable home, for there are richly-embroidered cushions on the bench. But so simple and natural a scene appears out of place among the other Greek pictures. One can hardly believe the subject could be selected by LEIGHTON.

(To be continued.)

## CHARACTERISTICS OF SOME GREAT LONDON THOROUGHFARES.—II.

[BY A CORRESPONDENT.]

A PROPOS of what may be termed breathing-spaces opening out of our crowded streets in the centre of London, where there are the possibilities of making them, and where a reasonable outlay of money is the main requirement, there is a crying want of such at the west side of Trafalgar Square, a want, too, which is apparent at Charing Cross and the West Strand. It has been previously stated how disappointing is the outlook forming the finish of Northumberland Avenue at its river end, owing to the particular angle at which it strikes the Thames (how different to the beautiful view of the dome of St. Paul's along Whitehall Place!) In making this remark, the writer does not wish to be hypercritical, because there were obvious difficulties in the way, and the immediate object was to gain the shortest road on to the Embankment. But what is still much needed is the revelation to the eye of the existence of a lovely wooded public park literally but a stone's throw from "the Square." Now, even those who have lived in London for many years, and are well acquainted with its principal streets, must acknowledge that a very small peep of the trees in St. James's Park is obtained from Trafalgar Square, the only evidence of their existence being occasionally afforded when a late autumnal gale from the south-west litters the road with hundreds of dead leaves. Of course the long-talked-of prolongation of the Mall into Charing Cross would afford the needed prospect, but a much less ambitious undertaking would suffice for the sylvan view, though the widening of the entrance into Spring Gardens, by DENT's shop, and carrying the extra width into the Park, whether for carriage or foot traffic, must necessarily be very costly, considering the value of property in this important situation.

To continue the remarks on the historic Strand, but farther eastwards, the proposition so often brought forward by "outsiders" (but not by the responsible Government of the day) for a further extension of Somerset House on the Strand and Wellington Street fronts up to the corner has always seemed to the public a most excellent and feasible thing, but for some, no doubt, good reason has not commended itself to the authorities. The opportunity appears to have been entirely lost until the advent of the Greek Kalends, as now a great building is being put up at this prominent corner. The writer has come to the conclusion, and is disposed to think very many will be of the same opinion, that it is futile to send letters to newspapers suggesting the Government ought to do such and such a thing, and how easy it would be and at such small expense. For they have good and sufficient reasons for their decisions, which it would be impolitic to "proclaim on the house-tops." Moreover, the concentration of the various public offices in the "City of Westminster" seems to be much recommended by the permanent Government officials. Before quitting the locality of Wellington Street, how much it is to be wished there were some sheltered but slightly elevated place on the Middlesex side of the

approach to Waterloo Bridge, which would give a view eastwards over the river and its surroundings. There is, indeed, not much to choose in the prospect, either up or down stream, at this point where the bend occurs, both being so charming, though that with St. Paul's Cathedral as the great feature is probably the most popular. Of course, the best views are from the bridge itself, but then one must be wind and weather-proof, and this elevated and exposed spot does not invite loitering unless the weather is very favourable, independent of the feeling that one is "in the way," owing to the incessant traffic across the water. Perhaps these notions may seem Quixotic, but it is the belief of the writer that the delights of the river scenes so very near to that great artery of London, the Strand, are by no means as much appreciated as they should be. What is wanted is something like the grand stand of a racecourse, only of course on a much smaller scale, with some covering and protection over it and open to the public *free*—the latter feature is essential. It is needless to say that such a place would have to be well watched, quietly, for obvious reasons, so as not to be misused. The effects of grand architectural compositions, specially in the case of towers and spires, are never seen to more advantage than with the foreground of a fine stream, with the constantly varying changes of London atmosphere about it.

It is unfortunate that notwithstanding all the arguments which have appeared in the Press in different forms, there is still a very large and thoughtless section of the general public who will persist in clamouring for the removal of the church of St. Mary-le-Strand, though it is true their voices are hushed for the present, only, it is to be feared, to break out at some future time with renewed vigour and added prejudice. They call it an obstruction, regardless of the fact that even were it so (which it certainly is *not*) this and the sister church of St. Clement Danes form one of the unique features in the Strand which differentiate it from that huge class of big streets without any special character of their own. For example, can anyone imagine the most casual observer who had once traversed this street confusing it with some other he had been through? The answer must be a direct negative. It is almost superfluous to remark how grateful anyone with the slightest artistic feeling ought to be that the once-favoured project of bringing the new street from Tottenham Court Road down to the Strand, opposite St. Mary's, has been abandoned. Without enlarging on the point, which has been already treated by abler pens, it is plain this beautiful design of GIBBS was never intended to be the termination of a long vista on its side elevations. As has been aptly remarked by Mr. GRAHAM JACKSON, the tower is not square, but wider on its east and west sides, proving that its architect, like his master, Sir CHRISTOPHER WREN, "had a head upon his shoulders," and so designed the work with an eye to its place. It is not pretended that the other church in the Strand, St. Clement Danes, is equal in merit architecturally to the one in question, specially as regards the body of the building. But both structures must be taken together in any complete scheme for improvements in this part of London; so that nothing commends itself more to the mind of the writer than the substitution of the south side of Holywell Street by a pleasant-looking garden of narrow width extending from church to church, with only the necessary few openings for ready access from north to south, on a somewhat similar plan to that of La Rambla at Barcelona, strongly advocated by the late HERBERT CARPENTER. The writer has fortunately seen the excellent effect of the treatment of this main thoroughfare in that Spanish city, which in one respect resembles London owing to its cosmopolitan character, though in other ways utterly different. There is no reason, where there is a special and particular object to attain, why the carriage traffic in both directions should not have a kind of *pleasance*, as has been suggested, in the centre, for a short distance, and this would be an immense boon in this crowded part. Witness the beauty of the green sward and shrubs on the west side of the Law Courts, as compared with the departed hideous wilderness which had sole possession for years of the possible site for an extension of the "Palace of Justice." Should any more buildings be required, as is probably inevitable (unless

human nature alters a great deal!), the fine Bankruptcy Offices, so well set off by the garden below them, will be practically hidden and out of notice. This building has an advantage possessed by scarcely one of the Government offices in London, with the exception of the recent new Admiralty buildings, where a lawn comes up to the balustrade of the area in front of it. What an enormous improvement it would be to have a narrow grass border with flowers round the Foreign Office next St. James's Park, instead of that dreary expanse of gravel spreading quite up to its walls! Surely there is object-lesson enough given by the examples of our old cathedral closes, such as Salisbury and Wells, or in the Colleges at Oxford, with their refreshing greenery.

There is probably no finer prospect of its kind in Europe (and the writer speaks with knowledge of some of the capitals on the Continent) than the view of St. Paul's when first caught sight of after passing Chancery Lane, and it cannot fail to impress even the most unobservant person. This effect has several very sufficient causes, one being the narrowness of Fleet Street, which gives scale to the great west façade of the Cathedral, and another is that this majestic building is seen on the farther side of a valley, and on the highest ground in the City. Supposing, for the sake of argument, Ludgate Hill were done away with by the formation of a viaduct, the writer is convinced much of the impressiveness of this striking approach would be lost; even if the road were straight instead of slightly winding as it is, that, too, would take off some of the good effect. The spire, also, of St. Martin's, Ludgate, about half-way up the hill, comes just in the right place to serve as a foil and contrast with the majestic dome on the higher ground beyond. Then there is no very lofty building either in Fleet Street or Ludgate Hill to take away the impression of the great Cathedral beyond. To those who recollect this thoroughfare before the London, Chatham and Dover Railway bridge was built, this "ornamental" structure has no doubt somewhat injured the general prospect eastwards, but fortunately it crosses the valley nearly at its lowest level.

It is not proposed to make any observations on the great thoroughfares on the Surrey side of the Thames, which are certainly to a great extent far less interesting than those on the opposite bank, until the rising ground in some of the southern suburbs is reached, when they become less monotonous. The flatness of the ground and the generally straight or nearly straight roads, a very large proportion being modern too, all these causes tend to deprive the leading thoroughfares "over the water" of "characteristics."

How entirely different is that great road running continuously from west to east through the centre of the Metropolis as compared with the streets just commented upon at length! For although Oxford Street must necessarily be one of the old roads, a considerable part of its length, save what used to be called New Oxford Street, has very little of that picturesque character which the route next the Thames possesses, as has been evident in many ways. Taking Oxford Street from the Marble Arch as far as Gray's Inn Road there is nothing of any antiquity to notice, and a singular dearth of churches to pass, too, whether ancient or modern. An honourable exception is St. Saviour's Church for the Deaf and Dumb, which brightens up Oxford Street. St. George's Church, Bloomsbury, with its extraordinary spire, is just out of a great thoroughfare, though very near it, and then there is nothing ecclesiastical till St. Andrew's, Holborn, is reached. Considering the mileage as compared with the streets near the river (the points of interest of which have been mentioned), this long, nearly straight and level road (with some few exceptions) presents a great contrast to that from Abingdon Street, Westminster, up to St. Paul's. However, in one respect, Holborn, with its Mediæval half-timbered houses in Middle Row, has the great advantage. But their days must be numbered, and destruction may come upon them "by the effluxion of time," though long may it be before that consummation is arrived at!

Tottenham Court Road has never been an interesting street to the architect, but has had the merit, for practical purposes, of a good width, and it is that which has led the authorities to unconsciously ruin whatever good effect there was in a broad thoroughfare by cutting it into halves so as to more economically light it by the electric light.

There can be no more fatal error in principle than this, artistically speaking, not only in a street but in a Church, where in some cases pendent gas lamps are hung over the central passage. The eye demands the centre of a road or otherwise should be clear and unobstructed, and not with lofty iron standard lights as in Tottenham Court Road.\* This ought to be looked upon as a cardinal maxim in such cases.

(To be concluded.)

### PETERBOROUGH CATHEDRAL.

ALTHOUGH the controversy on the restoration of Peterborough Cathedral was supposed to be ended by the decision of the Dean and Chapter, the following letters appeared in the *Times* on Tuesday. Mr. T. G. Jackson, R.A., writes:—

I should not have intruded myself into this controversy had I not been invited to sign the appeal to the Dean and Chapter of Peterborough, which is now going about, expressing sorrow at the proposal to rebuild their west front and asking them to reconsider their intention.

With the first part all will agree. Everyone will be sorry if the west front is rebuilt. We may assume that the Dean and Chapter, Mr. Pearson and Sir Arthur Blomfield will be as sorry as the rest of us. But to ask that the proposal may be reconsidered is a very different matter. For a man to commit himself to such a request without first ascertaining that the proposed work is unnecessary would be mere impertinence.

The appeal, however, we are told is being largely signed by persons eminent in literature and various walks in life—persons who have not examined the building themselves, and who, if they did examine it, have not the knowledge of construction and masonry requisite to make their opinion of the slightest value.

This is a typical instance of the way in which those who pose as protectors of our ancient buildings injure their own cause. They love them so well that they are indignant if others pretend to love them too. They seem to think that any one but themselves who has to do with an old building is liable to be seized with a sort of mania, leading him to destroy it unless he is stopped in time. An architect who, after satisfying himself of the need of repairing an ancient structure, is thick-skinned enough to undertake the task and to brave the obloquy which will be poured on his head finds himself nowadays in the position of a surgeon called upon to perform a delicate operation in the midst of a circle of his patient's friends, who cry out on his cruelty and pray him to spare the knife, while some will offer to take the instruments out of his hands and do the thing better themselves.

Such a situation is not conducive to the deliberate composure necessary for the success of an operation on a structure either of flesh and bone or of masonry.

I do not wish to express an opinion on either side of the present controversy, not having sufficient knowledge of all the facts; but I do protest against the absurdity, and worse than absurdity, of complicating a very difficult question by an irrational petition such as that now going round for signature.

Mr. J. Oldrid Scott writes:—I cannot lay claim to any special knowledge of this vexed question, but I have read the greater part of what has appeared on the subject in the papers, and in most of the letters and other communications protesting against the action of the Dean and Chapter it seems to me that an essential point has been intentionally or unintentionally put in the background, namely, that in placing themselves in the hands of Mr. Pearson, the Dean and Chapter have beyond all question taken the best possible means for obtaining trustworthy advice on a matter involving the greatest responsibility. Various other architects have been mentioned as advising a different mode of dealing with the gables of the west front, but I have no hesitation in stating my opinion that all their experience of such questions combined cannot be equal to that of Mr. Pearson, who at the present time stands quite unrivalled. Over forty years of incessant work in old and new churches gives Mr. Pearson's opinion on a point like this a weight to which no one else can aspire, and it would be nothing short of madness for the Dean and Chapter to put it on one side as they are daily urged by their critics to do.

The rival scheme which has been suggested appears to me, from my general knowledge of such cases, to be most hazardous, and if it were adopted I should expect it to lead to some serious catastrophe.

May I add a word as to the qualifications of Mr. John Thompson, the contractor? His practical knowledge and sound judgment is so great that I, as well as some other architects, have refused to undertake highly critical work unless we were allowed to appoint him as builder. Doubtless if the beautiful gables could by any means be rendered safe without

rebuilding them, everyone who loves our ancient buildings would rejoice, and no one more than the Dean and Chapter and their architect; but this having been pronounced on the highest authority to be impracticable, their careful reconstruction, stone by stone, with the least possible quantity of new material, is surely the next best thing, and I venture to predict that when it has been completed not one of the objectors in a hundred will be able to see that any rebuilding has been carried out.

Professor Baldwin Brown writes:—Many who are in principle neither restorers nor anti-restorers, but who would have each question of this kind dealt with independently upon its merits, are greatly dissatisfied at the present condition of affairs. The fabric of Peterborough is under the control of responsible custodians in the persons of the Dean and canons, but there is at the same time much force in the contention of those who claim it as in a sense public property. It is going too far in this direction to demand that such national monuments should be handed over, as is often the case on the Continent, to the care of Government. Those who have called for this can have but little experience of how some Governments carry out their work. Buildings may have suffered a good deal in this country at the hands of restorers, but fully as much or more mischief has been done in this way across the Channel. Were the west front of Peterborough handed over to the tender mercies of some foreign Government departments, it would probably be pulled down and rebuilt with new stones, and perhaps not even on the old lines, but with the additional height in the upper storey which there are grounds for thinking was originally intended by the designer. Our ecclesiastical fabrics are well enough off in the hands of their present custodians if these will exercise their trust with tact as well as with devotion. There is no question here of "destruction"—a word used by some who are in danger of spoiling a good case by too fervid advocacy. The Dean and Chapter do not want an old building remodelled to suit modern taste, or to substitute something new and neat-looking for antique stonework. "Restoration" on these pretexts would be rightly resisted by all, but the question here is one of arresting imminent, or at least very possible, ruin. If the cathedral authorities wished to give the public confidence they would perhaps have been better advised had they looked in a different direction for the control they desired to obtain over the report of their original adviser. Each of the distinguished architects they consulted is a man of independent judgment as well as of large experience, but in the eyes of most people they are too much alike in standing, education and traditions—the opinion of the two gives really no more confidence than the opinion of the one. There has, it is true, been a certain amount of antagonism in the past between antiquaries and architects, but when there was so much at stake the representations of the former might well have been allowed more weight than has been accorded to them.

Is it too late for a satisfactory settlement? Only the other day, when two powers in the railway world were standing apart in antagonism, a threatened disaster was averted by the appearance on the scene of an impartial authority in the person of the President of the Board of Trade. Could not some body of repute like the Ecclesiastical Commissioners now step in and negotiate a conference on the spot of some of those experts who hold strong and divergent views on this matter? Only in this way would the public mind be satisfied that the best thing possible is being done for the preservation of this noble Gothic frontispiece.

On Wednesday Mr. J. T. Micklethwaite writes:—

So far I have not taken any personal part in the controversy about Peterborough Cathedral because the officers of the Society of Antiquaries have the case for the defence in hand, and it seemed best to leave the whole conduct of it to them. But the letters of my good friends Mr. T. G. Jackson and Mr. J. Oldrid Scott in the *Times*, if left unnoticed, may make it appear that the opinion of architects is generally upon the side of the Dean and Chapter. Mr. Jackson and Mr. Scott belong by tradition and practice to the same school as Mr. Pearson and Sir Arthur Blomfield, and their sympathy with those whose ideas of "restoring" an ancient building is to make it into a new one is no more than might be expected. Mr. Scott's letter is only a general expression of his confidence in Mr. Pearson, but there are some things in Mr. Jackson's which need answering.

I pass over the conventional expressions of sorrow at the necessity of taking down the old front. If people are so very sorry, why will they not give a patient hearing to those who maintain that such necessity does not exist? But Mr. Jackson writes of the "impertinence" of those who are asking the Dean and Chapter to reconsider their decision to pull down, on the ground that the appeal is being signed by persons "who have not examined the building, and if they did examine it have not the knowledge of construction and masonry requisite to make their opinion of the slightest value." Now, if all

\* Since this was written the same mistake has been repeated in a considerable length of Piccadilly.

those who have signed were as here described, which is not the case, there would surely be no "impertinence" in their asking for a respite and a further consideration of the case, when a body like the Society of Antiquaries not only contends that the front may be well repaired without pulling down, but offers to prove its case by doing part of the work at its own cost.

Then Mr. Jackson compares the restoring architect to a surgeon carrying out an operation in the midst of a circle of the patient's friends, who cry out on his cruelty and pray him to spare the knife. Good. But what would be done with the surgeon who said that the case of the patient was so hopeless that the best thing to be done was to bleed him to death and put him out of his misery, and who, in spite of the protests of other surgeons, persisted in doing so?

In a second letter Mr. Jackson says:—My friend Mr. Micklethwaite in his letter to you this morning puts a meaning of his own on my letter. He says I range myself on the side of the Dean and Chapter. I do nothing of the kind, but have expressly disclaimed giving an opinion on either side because I do not know all the facts. If those who have signed this objectionable petition had done the same they would have done more wisely. Mr. Micklethwaite goes on to say that I belong to the same school as Mr. Pearson and Sir Arthur Blomfield, and therefore sympathise with those whose idea of restoring an ancient building is to make it into a new one. I do not know what right he has to make the latter accusation. Mr. Micklethwaite and I were trained in the same school, and I have seen restorations by him which are carried further in the direction of renovation than I should have taken them. He calls my sorrow at the necessity of rebuilding the west front—though I never said it was necessary—conventional, by which I suppose he means insincere. This confirms what I said, that he and his companions allow no one to love an old building but themselves. He objects to my calling it impertinent in persons who have no knowledge of the subject to sign this petition, because, he says, they only ask the Dean and Chapter for a respite on the ground that there is a difference of opinion among architects. But the petition asks for nothing of the kind. Had it done so it would have been quite legitimate, and I might perhaps have signed it myself. It merely expresses sorrow at the proposal to rebuild the front, and asks the Dean and Chapter to reconsider their decision. To this irrational petition, as I have called it, are appended the names of numerous persons eminent in other ways, but whose opinion on a question of construction and masonry is valueless. You, sir, have published the list, and, though there may be a few architects among them, the greater number are such as I have described.

Mr. J. Oldrid Scott also writes:—Mr. Micklethwaite's letter is very misleading, as it confuses the purely practical question with the sentimental one; as if those who back up Mr. Pearson did so from a preference for rebuilding over preservation. There is no shadow of truth in this, as far at least as I am concerned. I should infinitely prefer to see the gables preserved without rebuilding, if it were possible, but when it becomes a question whether Mr. Pearson, with all his practical knowledge, is to be trusted on a matter of pure construction or whether his opinion is to be set on one side in favour of that of Mr. Micklethwaite and his friends, I cannot hesitate for one moment.

Of course, what Mr. Micklethwaite says about my love for turning old buildings into new ones is as absurdly untrue as his suggestion that Mr. Pearson wishes to bleed Peterborough to death, but writers of this school hardly mean themselves to be taken seriously.

### RUINS OF ANCIENT TROY.

THE first secretary of the Imperial German Archaeological Institute of Athens, Dr. Wilhelm Dörpfeld, visited the United States to attend the commemorative exercises at Princeton University and incidentally delivered a number of lectures of great interest at Columbia University, the Brooklyn Institute, &c. Dr. Dörpfeld, says the *Scientific American*, is an industrious explorer of the remains of classical antiquity on the site of Troy, at Olympia and elsewhere, and his researches have given him an enviable reputation as one of the leading archaeologists of the world. His lecture on "Troy and the Homeric Citadel" was very interesting.

The question of the site of Homer's Troy was briefly reviewed by the lecturer, as it has been discussed in ancient and in modern times. The views of Strabo, of Demetrius, and of modern scholars were briefly set forth, and the results of Schliemann's excavations and the careful and successful work of Dr. Dörpfeld himself were dwelt upon at some length. On the site now proved to be the place where Homer's Troy stood, the excavations have revealed nine strata of earth and ruins, representing recognisably distinct periods in the history of the

three cities that have there been built—first the prehistoric, before Homer's time; then the Greek, the city of Priam; lastly, the Roman city. In the uppermost, or ninth, stratum were found a temple, theatre and other buildings of unmistakably Roman construction, with many inscriptions which show that the name Ilios is historic. Below this, in the eighth and seventh strata, are the remains of small houses of the Greek city, with evidences of fortifications of no great magnitude. In the sixth stratum is an acropolis with many buildings and storehouses, strong fortifications marked by towers and gates. Mycenaean vases, the painted archaic terra-cottas that are not later than 700 B.C., found in this stratum determine its date to be that of the Trojan war, as told by Homer—that is, between 1500 and 1000 B.C. In the fifth, fourth and third layers, period unknown, prehistoric objects occur. Still deeper in the second stratum are the foundations of the acropolis hill, with sumptuous houses built of unburned brick. The wall of the acropolis is massive, with towers and gates, and shows signs of having been several times rebuilt. Here is the "treasure house of Priam," about which Schliemann had so much to say. In the first stratum, the lowest of all, the town walls rest upon the rock. Other articles discovered are of an unknown antiquity.

Summing up the testimony of these researches, which he explained in detail, showing their significance by means of pictures upon the stereopticon screen, Dr. Dörpfeld declared that the upper stratum, the ninth, was clearly made up of the ruins of the Roman city of Ilion. The Greek settlements of various periods visited by Demetrius, Alexander and Xerxes have left their traces in the eighth and seventh strata. In the sixth stratum have been found the remains of the Homeric Troy, the city of which the siege and capture, with the varying fortunes of the war for the punishment of Helen's ravisher, formed the subject of the Iliad. The excavations below this base revealed only prehistoric—that is, pre-Homeric—objects and remains.

So, in conclusion, the lecturer declared that the question of Troy was solved. ("Die trojanische Frage ist gelöst.") The site, the very existence of the city had furnished the subject of learned research for 2,000 years. The most recent excavations had settled all doubt as to the existence of the site, and the character of the city. The citadel of Troy he held to be the most interesting group of ruins now accessible to the investigator of classical antiquity and of ruins still more remote.

### TESSERÆ.

#### The Beautiful in Art.

THE epithet beautiful is applied to such widely different things as a sunset, a human face, a flower, a landscape, a musical symphony, a greyhound, a poem, a piece of architecture; and there may be awakened pleasing emotions by the consideration of any of these objects. The first and essential property of beauty, then, is that it *pleases*. In most cases the satisfaction aroused involves two elements—the one sensuous, the other intellectual. The lower is the result partly of the harmonious action of an external organic faculty, such as sight or hearing, partly of that of the imagination. Thus we describe particular hues as beautiful, certain sounds as charming and in many examples just mentioned the important part played by the quality of the organic stimulus is evident. Along with this satisfaction due to sensation, there is also usually an element of gratification dependent on the exercise of the imagination. From a knowledge of the development of sensuous perception it is easily seen what a large part the reproductive activity of consciousness plays even in seemingly simple cognitions, such as those of a house or of a tree. Consequently, the pleasure of the effect must be attributed to the agreeable operation of both the presentative and the representative faculties of the lower order. The combined energies of the external and internal senses are thus of themselves capable of accounting for much of the delight aroused by the contemplation of beautiful objects, and we think those writers in error who would deny or minimise the reality of sensible beauty. Visual, auditory and motor sensations, both actual and ideal, conspire according to their quality, their intensity and their harmonious combinations to enrich the pleasurable sentiment of admiration. Nevertheless, human appreciation of beauty is essentially rational, and the importance of intellect in this department of cognition is shown by the absence of æsthetic tastes in irrational animals.

#### Disposition of Colours.

One of the first things a young painter is told is, that whatever colour he introduces into his picture must not be kept single, but must be repeated or echoed with some difference either in its quantity or strength in another part or parts of his composition; and the principles of reflection and refraction show that we must do so, because it is in this way that nature herself paints, for these principles always detach a portion of

tint from every object to place it somewhere else. In the general arrangement of colours, though nature leaves us a wide range of choice, yet even here she has laws that we may not break with impunity. West's theory of arrangement, according to the order in which the primitive and secondary colours take their places in the rainbow, has been noticed by Howard, but it would confine the combinations of effect far too much were art to bind itself to the observance of such a rule. The rainbow furnishes a satisfactory elucidation of the soundness of the advice of Reynolds, that the warm colours, red, orange and yellow, should be placed in the lights, from which the cold colours, as blue and green, should either be excluded or admitted only in small proportions. Every eye sensible to harmony must feel that unbroken blue is always unpleasant in the high lights of a picture. Green may be made more agreeable because it is nearer the light of the rainbow than blue. Gainsborough, it is said, painted his portrait of a boy in a pale blue dress, now in the gallery of the Duke of Westminster, by way of refuting the objection Sir Joshua made to light blue as a large mass. It was the opinion of Sir Thomas Lawrence that in this picture the difficulty is rather "ably combated than vanquished." We are not sure that it is even fairly combated, for Gainsborough has so mellowed and broken the blue with other tints that it is no longer that pure bleak colour that Sir Joshua meant; and after all, though the picture is a very fine one, it cannot be doubted that a warmer tint for the dress would have made it still more agreeable to the eye. In the most congenial aspects of nature the blue of the sky always serves as a half-tint to white or golden clouds, and when it is made to tell as a light by showing itself through the openings of dark clouds, the effect is chilling. As a half-tint, blue and indeed any cool colour may be used to great advantage in very large quantities. In Titian's *Bacchus and Ariadne* there is a great proportion of blue, but as it serves for a ground of relief to the flesh and to the bright red, orange and crimson draperies, which make the lights, the effect is splendid, and the picture is a fine specimen of that golden tone in which Titian is scarcely ever rivalled.

#### Coloured Bricks in Buildings.

If coloured bricks be employed as enrichments to door or window openings, they must either be limited by definite lines, maintaining proportions which have relation to the openings themselves, or when these cannot be obtained their limits must be left so vague as to prevent their suggesting that proportion was attempted, but could not be secured owing to the difficulties inseparable from its accomplishment. We need not be reminded that if a door or window receive any kind of decoration beyond its clear opening the proportions of the decoration will materially affect those of the opening itself, and especially if the colour of the decoration be conspicuous. Coloured bricks are, for this reason, most unmanageable. Unless they are purposely moulded or cut for adaptation, like stone, they ought to be applied only to those openings which are multiples of their own dimensions. As moulded and cut bricks are not those under present consideration, the established length, breadth and thickness cannot be set aside; and while admitting the efficacy of the limits assigned to each of these for the purposes of construction, the doubt arises as to how far they are qualified to supply the elements of good proportions. This doubt is strengthened when we consider them as substitutes for moulded bands and string-courses. Three inches, the accepted thickness of a course of common brickwork, may be termed the small divisor of the vertical subdivisions of an elevation, and any bands which may be introduced to give these subdivisions prominence must necessarily be multiples of 3 inches. For the bands of low buildings three of these divisions will be sufficient if they are flat; but when their outline is varied, four at least are required, as their increased projection renders it necessary for the uppermost course to be weathered. Unless the band be of considerable length its depth of 12 inches will appear disproportionate, for, supposing the weather-course consist of headers, which is not desirable, and it projects  $4\frac{1}{2}$  inches from the face of the wall, which is as much as it should do, but little variety of shadow can be obtained below it, not sufficient, certainly, to redeem it from heaviness. The distribution of a 12-inch band, which was often adopted by the old builders in brick, and which appears to be the simplest and most effective, is 3 inches for the weather course, 3 inches for the ornamental course, either saw-tooth, billet mould, or dentils, and underneath a plain course of 6 inches to receive their shadows. In modern works the third course is frequently flush with the face of the wall, and the lowermost course projects  $2\frac{1}{2}$  inches so as to serve as a necking. This arrangement possesses the advantage of giving to the ornamental course the benefit of its entire projection, but at the same time it divides the 12 inches into four equal lines, each of which is only 3 inches in breadth. To avoid the difficulties attending the unalterable limitation of 3 inches, another plan has been adopted, which few will allow to be very successful; it is that of enclosing 9-inch square variegated tiles between two fillets of cement, each fillet being  $1\frac{1}{2}$  inch in breadth.

#### General Laws of Art.

The laws of art are nothing else than the conditions under which alone the sensibility of the soul can be excited to agreeable emotions by external forms; they determine the artistic form according to the demands of sensibility and have their foundation, therefore, in the constitution of the sensitive faculty. The artistic form must, in the first place, in order to excite a connected emotion in the sensitive faculty, possess a general conformity to laws, which is manifested in the observance of mathematical relations or organic forms of life; without this regularity it ceases to be artistic form. But this conformity to law is not in itself capable of expressing an internal life; it is only a condition of representation, the boundary of the artistic forms which range to and fro within, modifying, but on the whole preserving, this conformity. Whilst this regularity is the first requisite in the artistic form generally, beauty is a more immediate predicate of the artistic form in reference to sensation. We call those forms beautiful which cause the soul to feel in a manner that is grateful, truly salutary and altogether conformable to its nature, which, as it were, produce in it vibrations that are in accordance with its inmost structure. As the soul naturally strives after the grateful and salutary emotion in its sensitive life, so the beautiful is certainly a principle of art, without, however, being even in itself an object of representation or artistic idea in the above sense, as the latter is always an absolutely particular idea and sensation. On the contrary, beauty, carried to the highest point, even stands in direct hostility against every endeavour to produce something particular. The sublime and the graceful may be regarded as opposite points in the chain of sensations which is denoted by the beautiful; the former demands from the soul an energy of feeling wound up to the limits of her power, the latter draws her of itself, without any exaltation of her force, into a circle of agreeable sensations. It lies in the notion of a work of art, as an intimate combination of an artistic idea with external forms, that it must have a unity to which everything in the work may be referred, and by which the different parts, whether successively or simultaneously existing, may be so held together that the one, as it were, demands the other and makes it necessary. The work must be one and a whole.

#### East Anglian Church Towers.

These towers, though varying from 7 feet 7 inches internal diameter (Mettingham) to 19 feet (Wortham), have walls about 4 feet and 4 feet 6 inches thick with only one entrance, namely, at the east, and therefore from the body of the church. These windows where they remain unaltered are either small circular eyelets or narrow loop-holes, with plain semicircular arched heads pierced out of the stone, and mostly with chamfered edges. Other windows have been inserted at every age since, and also, with few exceptions, either the churches have been rebuilt or have been attached to the towers. The upper stages also or parapets have been rebuilt, mostly octagonal. In only one instance, that of Fritton, in Suffolk, is there a complete type (nearly complete, though enlarged by aisles) of all these buildings, though the tower is not remarkable except for its dilapidation, the severe cracks being merely filled up with cement. The church has a nave and chancel of early form, 51 feet long internally and 11 feet wide. This has since been widened to 21 feet, but the original was but 11 feet as stated. The east end is apsidal and very perfect. One peculiarity exists here, and only in one or two other churches. It is the "tapering" of the plan from west to east. The chancel itself is vaulted and also diminishes in height towards the east. All the other churches are equally simple parish churches, such as were common in the Norman period. The tower of Wortham Church is remarkable for its magnitude and for the sets-off. In that of Herringfleet we have a tower which, in its whole height, appears to have more of the original than others. It has the Norman billet-moulding as well as a centre shaft to the window of the upper part. This window would in many cases be termed Saxon even in the present day, but how a Saxon upper storey such as this could have been placed on a purely Norman substructure is not manifest. There are instances, it is true, of earlier work with later work both beneath it and surmounting it. St. Mary's, Leicester, has the nave of Norman work pierced below with twelfth-century arcades and with still later walling over the Norman, but a circular flint tower can scarcely have been underpinned in the same manner as a plain wall could be. It may be concluded (1) That in most cases the churches have been destroyed or rebuilt, while the towers have remained. (2) That the towers were probably built by one class (or lodge) of workmen, and are all of nearly one age. They have precisely the same characteristics—similar in material, shape and (with one exception) size, and are without staircases. (3) That they were built for use as bell-towers. (4) That they were erected about 1100 to 1150. If they were of earlier date—and no doubt there is very great difficulty in determining their date from the mere walling—it may be assumed that all the towers had been originally detached and that the churches had been built against them, and that all the principal openings had been made subsequently to their first erection.

## NOTES AND COMMENTS.

It is commonly supposed that steel-plates will sustain a higher tensile strain than is usually assigned. But the Steel Investigation Board appointed by the Government of the United States have found that armour-plates for war-ships can be produced which are below the standard quality. Several specimens failed to pass the contract test requiring 60,000 lbs. tensile strength to the square inch, as well as the requirement of 25 per cent. elongation. Of twenty-eight tempered and as many untempered plates fourteen of the former and eighteen of the latter failed in the tests. The cold-bending trials have shown lack of ductibility. As the latter test is considered to be most important further trials are to be made with specimens 2 inches in width, cut from steel that is new. It is believed by the authorities that the defects are to be attributed to careless inspection. Price may also be a factor. As the American ironmaster said to EMERSON, "If there is slag in the price you must expect slag in the metal," and in America more will be sacrificed to profit than in Great Britain. The failure of the tests at Newport will induce many people to approve of the action of the Board of Trade in fixing a lower constant for the strength of steel than is justified by experience with English products.

In the course of the summer the "Erinnyes" and "Antigone" will be represented before the French President in the old Roman theatre at Orange. It will then be possible for a much larger number of people to witness the performances than hitherto, or, at least, since the Roman power declined. After lying neglected for centuries, M. FORMIGÉ, of Paris, was requested to undertake the restoration of the ruins. It will be remembered that, as was usual in ancient theatres, there were steps which formed benches rising from the ground level. But no more than six rows remained. The vaults which were constructed to support the benches had also disappeared. The reconstruction of the vaults is nearly complete, and various breaches in the walls will be filled up. The theatre will be far from appearing in its ancient grandeur, but it will be more suggestive of Roman days than any of the ruins of similar buildings in Athens or Taormina. The auditorium is 340 feet in diameter—the stage wall being that length and 116 feet in height. From its immensity the theatre must have been a valuable quarry for the engineers of a later time, who used the stones for fortifications.

ONE of the Paris papers has had lately a series of articles concerning what is to be done with the sons of Frenchmen of the middle class. As ideas appear to be diffused in some sort of atmosphere which all minds must inhale, no one is surprised to find the *Chicago Record* dealing with the same question in a different manner. In considering the American young man and his chances of success it was natural to inquire about the architectural chances. Mr. D. H. BURNHAM, the architect, in reply, draws the following satisfactory picture of the state of business in American offices:—The architects' offices in which a large amount of work is done are all of them picking and choosing from among the choice young students from the schools. The man who comes with a ringing name from an eminent school will not only find a place to work and expand in, but there is competition for him. The offices of to-day do not readily take those who have had no special training in the schools, and who are never as valuable as the trained men; therefore their chances are much less in art. However, in an architect's office there are many problems which have comparatively little to do with art, and which are more especially engineering in its broadest sense. These afford opportunities for the employment of another class of men, who are indispensable in a large practice, and whose services are much more valuable for the purpose for which they are used than are the men from the architectural schools. There are plenty of chances for both, although the prizes within the reach of one class are far above those the other may ever hope to grasp. I would sum up by saying that "the opportunities for young men in architecture" in the

future are going to be very extensive; that the fellows who are really well trained need not fear about bread and butter or opportunities to shine, and that they may hope to rise as high as their powers will permit. There never were in the past, and are not now, such opportunities as the future holds in store for men of high worth in architecture, either for material compensation or for undying distinction.

It is sometimes found to be difficult to discover a book which would be suitable as a present for a young engineer or one aspiring to a similar calling. The "Thames Bridges, from the Tower to its Source," by Mr. JAMES DREDGE, and published at the offices of *Engineering*, would serve that purpose. There is no river which is spanned by a greater variety of bridges than the Thames. Timber, stone, cast iron, wrought iron and steel have been employed in the work, and if a new material is discovered which is suitable it is sure to be quickly utilised for crossing the river. Many attempts were made to describe a series which epitomises bridge-work, but Mr. DREDGE is the first who has persevered until completeness was attained. The views are reproduced from photographs, and form a collection which it is pleasing to see for the sake of the associations which are connected with the river, although too many of the bridges are ungraceful enough. The descriptions, it is needless to say, show an appreciation of the scientific principles exhibited by each example.

THE effort to secure HOLBEIN's picture of the incorporation of the Guild of Barbers with the Guild of Surgeons for the Guildhall has failed. The few subscriptions which were obtained by Sir JOSEPH DIMSDALE and Sir STUART KNILL have been returned. It is, however, not difficult to understand the indifference of the public. The picture contains many portraits, but not one of the men who are represented as kneeling before HENRY VIII. is a person whose name excites general interest. If they were prisoners imploring pardon for some municipal freak they might be popular. The price, 15,000*l.*, asked for the picture seemed excessive, although after a course of cleaning the value of the work would be enhanced. Finally, it was not quite clear whether the money or the greater part of it would not follow the ordinary course of the revenues of the majority of the City companies. The proper place for the picture would be in the Guildhall gallery, and the Barber-Surgeons, by undergoing a slight amount of self-sacrifice, could make that destination attainable.

## ILLUSTRATIONS.

## THE RETURN FROM THE CHASE.

WHEN M. CORMON was awarded the Médaille d'Honneur of the Salon a few years back there was less discussion than is usual. Concerning the ability of the artist there is no question, and if he cared to be less indifferent to the strategy which is generally needed to attain a foremost position, M. CORMON might have owned the medal at a much earlier time. He is no ascetic who despises honours and rewards, but he will not make sacrifices to get hold of them. To M. CORMON painting is what poetry was to COLERIDGE, "an exceeding great reward," and he finds more pleasure in working on his canvas than when he is the observed of all observers at a distribution of prizes. We may be sure that when he was representing his prehistoric hunters he often wished he could have a holiday in tracking a bear or any savage animal, where he could exercise his courage and unconquerable good humour, and an invitation to such a scene, we imagine, would be more appreciated by him than one to any "splendide réception." M. CORMON always contrives to impart his own exuberant animation to his figures, and his hunters are all genuine Gauls who are happiest when in action.

## LINCOLN CATHEDRAL.—II.

ALTHOUGH Professor WILLIS when describing Lincoln Cathedral treated the architect who was St. HUGH's friend with not much respect, he uttered the remarkable judgment that in architectural excellence the cathedral is superior to every other cathedral in England. We may say that similar words have been used concerning many of the cathedrals, and in judging them it is difficult to be impartial. Lincoln is, however, among those which possess

the most artistic qualities. The fact is suggested not merely by the admiration which general views of the building, especially the interior, excite, but by the importance attached to the details, examples of mouldings and ornaments being cited as exemplars of style. The late E. SHARPE selects the building as a type of his Geometric period as well as of his Lancet period. Lincoln at one time also presented examples of stained-glass which were comparable with any others in England. The quality of the

LINCOLN, SOUTH AISLE.

work can be judged from the great rose or wheel window in the north transept, which the late Mr. WINSTON declared to be one of the most valuable and perfect works in existence. The subject is the Church on Earth and the Church in Heaven, and the greater part of the ancient glass remains in its original position. The whole central part of the window is occupied with a representation of the Blessed in Heaven—CHRIST sitting in the midst. The sixteen circles which form the outer part of the window set forth the scheme of man's redemption and the efficacy of Holy Church. In the topmost circle is represented OUR LORD, seated on the rainbow, displaying the points of the nails in His hands and feet and the wound of the spear in His side. The two next circles on

each side are filled with angels supporting the Cross and other instruments of the Passion. In the next circle, on each side, are holy persons in the act of being conducted to heaven by St. PETER and other saints. The two next circles on either side are or have been occupied with the general Resurrection, and each of the lowest five circles is filled with the figure of an archbishop or bishop in Mass vestments.

In his criticism on it Mr. WINSTON said :—"The north rose window exhibits as well, I may observe, the general principles of composition common to all Early English windows that contain a number of pictures. Each picture, the design of which is usually very simple, is placed in a panel having a deep-coloured ground and a rich border.

Photographed by S. B. Belas & Co.

LINCOLN, CENTRAL DOORWAY WEST FRONT.

The panels themselves are embedded in a coloured ground. Very little white glass is used, so that the window in its general effect is a mass of rich and variegated colouring in which the tints of the grounds predominate. The design, owing to the smallness of its parts, is confused when seen from the proper point of view—the floor of the transept. The various panels which we see inserted into the other windows without doubt once formed parts of medallion windows, whose general effect may be gathered from that of the north rose, and of whose general arrangement an idea is conveyed by the modern imitation window in the south aisle, and by the original ironwork still remaining in the first window from the west in the south aisle."

Unfortunately no other portion of the Early English glass in the cathedral is in its original position. The white patterns which fill the five windows immediately below the north rose have clearly been removed from other windows, and the same may be said of the contents of both the lowest north windows of the transept. In the westernmost of these two windows the figures of five angels playing on musical instruments have been inserted. These are Decorated, and belong to the west window of the nave. Most of the glass in the southern rose is also Early English, and as well as that with which the four south windows of the transept are filled, has been collected from other windows. As ancient stained-glass is almost essential to give character

LINCOLN. DETAILS OF CENTRAL DOORWAY.

to a Mediæval building, it becomes evident that Lincoln Cathedral suffers from its absence, or from substitutes which, however excellent, have not the same effect as old glass.

Another drawback is found in the empty chapels. Lincoln possessed about twenty chapels and chantries, for the adornment of which endowments were provided. For some of them it was necessary to have special keepers to watch over the altar-plate and other ornaments. It is not difficult to imagine how the appearance of the cathedral was enhanced by so many masses of rich colour which compensated for the coldness of the masonry. In the deprivation of its adorned chapels Lincoln is not unique, but as a building of which the plan was a "Lorraine cross,"

or with double the usual number of transepts, auxiliaries of the kind were especially needed.

There is much in the cathedral which can be considered as proof of most skilful construction. As a *tour de force* the "stone beam" or flat arch between the western towers is unique in England. The following description of it is by the late W. A. NICHOLSON, architect, of Lincoln :—

"The arch is constructed between the western towers at a height of about 80 feet from the pavement of the cathedral, and immediately over the junction of the vaulting between the towers and the vaulting of the nave; its abutments are thus formed by the eastern walls of the two towers.

Photographed by S. B. Eolas & Co.

LINCOLN, DOORWAY, WEST FRONT.

"The arch itself consists of twenty-three stones of unequal lengths; the width of the extrados is barely 1 foot 9 $\frac{1}{4}$  inches, the thickness of the arch is uniform throughout and is 11 inches. The span, measured horizontally, is exactly 27 feet 11 inches between its apparent abutments, but it is necessary to observe that the towers, which are of Norman construction, have been in several parts encased with new masonry in the interval between their original erection (about 1100) and the completion of the nave, aisles and other adjacent parts (about 1250) as they now exist. This facing is continued above the arch in question, and the formation of the joints in the new stonework leaves little doubt that the real abutments are formed by the original walls of the towers, thus making the actual horizontal span 30 feet. The southern abutment is 12 $\frac{1}{2}$  inches higher than the northern one, measuring upon the new facing just described. The haunches of the arch are filled up, and there are indications of the filling in having been continued nearer the centre than it is at present. This part of the work has been originally bedded in mortar, but is now quite loose and detached.

"In all the authorities I have had an opportunity of consulting, the arch has been considered a segment of a circle. It is true that, in a description of the cathedral drawn up by Mr. LUMBY, clerk to the fabric, and published in vol. iii. of 'Vetusta Monumenta,' its deviation from a segment is noticed, but is attributed to a 'very small settlement.' This, however, is not the case, the dimensions leading to an obvious conclusion that the arch is Pointed, and described from two centres. In order, nevertheless, to afford an opportunity of comparing the conclusions deduced by other parties who have given the dimensions of the arch, upon the supposition of its being a segment, with those which would follow from the admeasurements I have made, it may be well for the time so to view it. Thus considered, its chord would be found by calculation to be 27 feet 11.304 inches; the versed sine of half the arc, 1 foot 2.375 inches, and consequently the radius would be 82 feet 0.75 inches, and the arc would include 19° 36' 16".

"But, as I have said, minute admeasurements preclude the supposition of the arch being a segment of a circle; for had such been the case, every part of the arc would have conformed to the same law, and an investigation founded on the dimensions of any portion of the arc would have resulted in showing the same radius. On drawing the elevation from the dimensions, and whilst I was still impressed with the popular idea that the arch was a segment of a circle, it became obvious to the eye that it was of a Pointed form, and on testing this by calculations based upon the dimensions I found this minutely verified.

"The radius of the southern arc as deduced from the dimensions is about 12 feet 6 inches less than that of the north arc, and the versed sine of half the arc 1 $\frac{1}{2}$  inch greater. This inequality is perhaps the result of irregular settlement when the arch was first built, or more probably of some subsequent yielding of the abutments, as both the towers have many extensive fissures in them, which could scarcely occur without some derangement of the form of the arch. Indeed, there is reason to believe that since the publication in 1791 of Mr. LUMBY's report before referred to, a spreading of the abutments has occurred. He describes the soffit of the arch as being 12 inches above the stone vaulting, whilst at this time it is not more than 3 inches. His investigations appear to have been conducted with great care and accuracy, and it is difficult to believe he could commit so great an error in nearly the only dimension that can be obtained without the erection of scaffolding.

"The arch is constructed of stone from the Lincoln quarries, being the same as that used, with few exceptions, throughout the cathedral. The exposed surfaces are wrought with the toothed chisel in a careless and imperfect manner, and the joints, contrary to what might have been expected, are decidedly ill formed, and have beds of mortar fully half an inch in thickness within them. There is no trace of iron being used in the construction of the arch, either in dowels or other form; nor do I believe that it derives assistance from any such extraneous means. The arch vibrates perceptibly when jumped upon, and I am of opinion that the constant practice of visitors thus to prove its elastic properties has a tendency to impair its stability.

The mortar between the joints is of a very friable nature, and has detached itself from the parts where it has been used in pointing the joints to conceal the irregularity of the workmanship, and it must be still further crushed by the violent concussions to which the arch is almost daily exposed.

"It appears to me to be in vain to offer any plausible conjecture as to the purpose for which the arch was originally constructed. It is nearly certain that it was not built at the same time that the towers were erected, inasmuch as it would, in that case, have been above the eaves of the original roof; it was more probably built shortly after the reconstruction of the nave of the cathedral, when for the first time it was vaulted; but what purpose could it then answer? The vaulting between the towers would have a tendency to prevent any inclination of the towers towards each other of infinitely greater efficacy than the arch itself; and indeed its form and want of mass preclude the idea of its being built with such an object, at a period when the science of construction was so perfectly understood and so admirably applied as it was in other parts of the cathedral. It may, as has been generally supposed, have been constructed as a test whether the towers were capable of sustaining the additional height of about 60 feet, besides spires of timber covered with lead, which were superadded to the original Norman towers about the middle of the fourteenth century. But before such an opinion be received it must be borne in mind that the vaulting already executed offered a similar standard, and also that the same divergence from the perpendicular which would be indicated by the settlement of the arch would very probably have occasioned its fall, and the destruction of the vaulting beneath it; and further, it is obvious that more accurate and less hazardous tests might have been applied with greater facility. On the whole, I cannot avoid thinking that it was not erected with any view of adding to the stability of the towers, or of indicating any failure, but rather that it was built by a body of masons desirous of illustrating the amazing effects which the science they studied and practised placed within their attainment."

## THE ANCIENT CITY OF NIPPUR.

THE curator of the Babylonian department of the University of Pennsylvania, Professor Hilprecht, has made discoveries, says a Philadelphia correspondent of the *Chicago Chronicle*, which push history, of which there are written records, back to 6000 B.C. He has written eight records that probably carry back human history to nearly 10000 B.C., and is able to see beyond this period to a very ancient prehistoric period, which makes the chronology of Usher, printed in most Bibles, and which places the beginning of the world in 4004 B.C., look rather ridiculous. The discoveries of Professor Hilprecht were all made possible by the material gathered together by the University of Pennsylvania's Babylonian exploration expeditions, and these expeditions were made possible by the liberality of a mere handful of wealthy Philadelphians, who subscribed nearly 70,000 dols. to support what are now known the world over as the Nippur expeditions. The explorations of the antiquities of Babylonia have been going on for eight years, and after a lull since last spring they will be renewed next spring upon an entirely new basis, and a new campaign to last three years will be begun, of which marvellous things are expected. The work of these three campaigns has almost revolutionised all ideas as to ancient Babylonian history, and will be the foundation for some of the most important volumes on archaeology ever written. At 4004 B.C. there was a very polished civilisation existent in the valleys of the Tigris and Euphrates, and which had been existent for many millenniums before. And of this very ancient civilisation Nippur had been the holy city, sacred to the god of these ancient peoples. A city marked by massive temples and showing a high state of civilisation, and yet of such antiquity that the story of civilisation, as related by the legends of those who remembered Nippur and its greatness, declares there was a time when heaven and earth were not created and the city of Nippur did not exist. Nippur at present, then, easily figures as the most ancient city in the world, and it is through, in and by Nippur that the discoveries have been made that have unlocked the secrets of the centuries and pushed the records of civilisation so far back as to startle even those who are accustomed to delving in the remote past. The spot that is now famous over the world is a ruined city, lying between the Tigris and Euphrates, about 150 miles south of Bagdad. The ruins form

a conical hill, rising out of the level and marshy fever-breeding plain to the height of about 100 feet. The central portion of the ruins is about 45 feet higher than the mass of the surrounding *débris*. Layard, the Assyriologist, who prospected in the Nippur ruins a number of years ago, was of opinion that nothing of value would be found there. Using modern methods of research, however, and cutting down through the whole 100 feet of material by means of huge trenches, the University workers have accomplished wonders. The way in which the age of the different inscriptions and finds is determined is the same as the method used in determining the age of the earth—by means of the superposition of the strata, that lowest of all being the oldest. Applying this method to the great ruins of Nippur, as the explorers gradually worked down into the mound they found various levels, which, by means of inscriptions, were identified, and these acted as keys to the determination of the whole mass. On top of all were the ruins of modern times, from the present down to the early centuries before Christ. The first great dividing line was the discovery of the platform of Ur-Gur (about 2,800 B.C.), on which stood the great temple tower, which was rectangular in shape and about 197 feet by 177 feet, composed of three terraces, the lowest storey of which was about 21 feet high. This temple tower was built of a solid mass of brick, and was called a zigurrat. Below this platform of Ur-Gur was discovered the pavement of Sargon (3,800 B.C.) built of huge burned brick. Below the pavement of Sargon the *débris* extends over 30 feet before the ground level is reached.

Of this Professor Hilprecht says:—"If, roughly speaking, the discoveries above the pavement of Sargon represent the accumulation of about 4,000 years for about 40 feet of material, then the 30 feet below Sargon must represent at least 3,000 years of growth, as there being no great tower temple (zigurrat) to add to the *débris* by its crumbling, the deposit of *débris* must have been much slower and hence the age of the original first settlement at Nippur one of the most ancient known to history." The determination of age and periods by means of strata is only one of the ways of getting at the secrets of antiquity. The other methods are reading of the inscriptions found, study of the art works and a minute comparison of all the details of life unearthed. Having gone all over this for years, Professor Hilprecht summed it all up by telling the story of Nippur somewhat as follows:—The most ancient inscriptions found show that over 8,000 years ago, probably 10,000 years ago, there was an advanced civilisation in the Babylonian plain, lying between the Tigris and Euphrates. The Persian Gulf came farther inland then, and Nippur was near the sea coast. Forests of sub-tropical character flourished and the people lived a simple agricultural life, with the arts quite advanced and writing considerably developed beyond the simplest forms of picture writing. This country was called Kengi, the land of the canals and the bulrushes, for agriculture at that early date was pursued by means of irrigation, and among the vegetables raised the onion was highly prized. The people of the land of Kengi were not Semitic, but Sumerians, who had a curious language of a type something like the Finna Tartarian, a Turkish stock, with a vowel harmony. As none of the modern forms of language are like it, deciphering the Sumerian inscriptions is not a simple task. Nippur was the centre of the religious worship of the Sumerians. This is shown by its great prominence in the records and the fact that at Tello, a very ancient town to the south of Nippur, the gods are said to be sons of the Bel (Baal) of Nippur, and the kings of Tello ascribe their election to the Bel of Nippur. In time the Sumerians became effete—even at that early day civilisation wore out—and the Semitic nomads, who had been hovering for many years and through many dynasties on their northern border, were able to conquer some of the outlying towns. One of these was Kish, which was taken by the Semites about 5,000 B.C. There was then on the border a mingling of the two civilisations. The invaders adopted the manners, customs, writing and religion of the invaded, and in this way the Sumerians impressed themselves on their conquerors. When it is remembered that until recently both Maspéro, the great French authority, and Winckler, the German savant, put the most ancient Babylonian civilisation known to history at 3500 B.C., the revolution in archaeology accomplished by the Philadelphia Babylonian exploration fund, which allowed Nippur to be dug up, can be easily estimated.

## ST. MILDRED'S CHURCH, BREAD STREET.

THE Chairman of the City Churches Preservation Society has received the following report from Mr. Theodore Moore, of 7 Leadenhall Street, on the railway proposals to remove St. Mildred's Church, Bread Street, for an electric railway station:—

In accordance with your wish I have examined this beautiful little church, built by Sir Christopher Wren after the fire in 1666. The fabric and its details remain to this day almost as he left them, and any decision to remove the church would add another reproach to the City, which is so culpably indifferent to the preservation of such gems of art. Mr. Birch, in his fine work, has described the church and its details so well that it is not necessary for me to attempt any description. Let me dwell somewhat, however, upon the leading characteristic, which cannot fail to impress the observant. It is the masterly simplicity of the means by which the architect produced his charming effect. It is easy, one may think, to deduct a square from an oblong, to put a dome in the square, to throw two broad coffered arches over the spaces remaining, to complete the arch scheme by two outlines against the side walls, and to carry your dome on pendentives. But it is an ease which comes only by much thought of a great mind. This church, only about 60 feet by 36 feet, has, by its designer's treatment, attained an airiness of effect and a modest dignity which might have been depression and insignificance. All of it should be preserved with a care that should increase as the years go by—the fabric, with its internal grace and external propriety, the gorgeous pulpit and sounding-board, the chastely-wrought reredos and screen and panelling, not forgetting the pews (which are threatened by others than promoters of Bills in Parliament), the font, the sword rest and supporters, and all the little things. So far as can be seen without a more minute survey, there is no insecurity or dilapidation, no earthly reason why a characteristic specimen of an Augustan period in church building should not be preserved. Without going into matters of sentiment, such as the birth of Milton or the marriage of Shelley, we have here a thing of intrinsic value, which no man with a cultured perception would think of touching with a destroying hand.

It is proposed to request Mr. Moore to visit the Birmingham churches threatened by the Bishop of Worcester's Bill, as their friends in that city have applied for the co-operation of the London Society.

## ST. MARY'S CHURCH, SCARBOROUGH.

AN address on the history of St. Mary's Church, Scarborough, was lately delivered by the Bishop of Hull. His lordship said the church was only about half the size of the original one. Scarborough at one time was very rich in religious houses, and after enumerating the founding of many of these as early as about 1154, 1230 and 1306, he said the parish church was by far the greatest amongst them. It was then a Cistercian church. They were unable to tell exactly when the first church was built where the parish church at present stood. Probably, however, the earliest church of which they had any traces built there was about the year 1180, which would be in the reign of Henry II., about the time St. Nicholas Church was built on St. Nicholas Cliff. The traces of the earliest church were to be found in what is called the string-course at the end of the south aisle of the present church. There were also traces to be found in the broken capitals in the east end of the south aisle and in the vicinity of the organ. It was concluded that the early church had a nave, aisle, certainly a south transept, and probably a north transept. In the western towers, built probably in 1190, they had the transition from the Roman to the Early English. There seemed to be an apparent intention about this time to rebuild the whole church. The tower was finished about the year 1198, and then came an interesting fact in the history of the church, which those who cared about history, but did not care for one moment about architecture, might be interested in. It had been said upon the greatest authority that no church of the Cistercian order had western towers, and it was a curious fact that the parish church was an exception to the rule, and no other exception could be found throughout England. It had been conjectured that the parish church had been built before it had been determined to what religious body it should be given; that it was built and then afterwards given to the Cistercians. Richard I. was in the habit of paying a hundred marks to the Cistercian order that they might provide hospitality for the abbots of the order upon the great feast day, but eventually the king resolved to free himself from this payment, gave the church over to the Cistercians and told them to pay the hundred marks, and this, it was stated, accounted for the strange anomaly of a Cistercian church having western towers. It had often been asked whether there were any traces to be found of monastic buildings in the present church. There never were any Cistercian monks

**The Portrait** of Mr. Herbert Spencer, which is to be a memorial of the completion of his "System of Synthetic Philosophy," is to be painted by Mr. Hubert Herkomer, R.A.

**The Plans** for the French Hospital recently opened in Constantinople were prepared by the late M. Bourmancé by order of the French Minister of Foreign Affairs. On the death of M. Bourmancé through cholera, M. Carré was appointed to take his place, and has completed the work.

living there, and, as far as could be ascertained, there were no monastic buildings.

The nave was commenced about the year 1210, and was finished about the year 1225. The south transept was built next about the year 1340; then came the St. James's Chapel about 1380, St. Stephen's Chapel about 1394, and the chapel of St. Nicholas about 1397. Then the porch was built with its extremely beautiful roof. His lordship then drew attention to the magnificent chapel which they now believed to be dedicated to St. Mary the Virgin, in which a beautiful window had been recently placed. In regard to the roofs, he had been told that there were no roofs to be found in England like those they possessed at the parish church. Some of a similar character were said to be in several Scotch castles and in Scandinavia. The roofs in that church certainly were magnificent, consisting as they did of large slabs of stone placed one upon top of the other in the most beautiful manner. After referring to the St. Nicholas aisle—140 feet long and 24 feet wide—possibly built by the guild of St. Nicholas, which was in existence at the time, St. Nicholas, too, being the patron saint of fishermen, his lordship next described the old choir, which he said extended the whole length of the church, 216 feet 3 inches. It was built somewhere about the year 1450, and lasted for two centuries. The early church then, during the zenith of its splendid career, had a nave, three aisles, four chapels, two transepts, choir, aisles, a central tower and two western towers, and with the exception of the then unrivalled Whitby Abbey, was the finest church in the country. It was 216 feet 3 inches in length and 100 feet 5 inches across, whilst its walls in places were 8 feet thick.

The church remained in this condition of splendour until the middle of the seventeenth century, and then the great siege began. On October 10, 1659, the great tower of the church fell into the nave and did great damage. The tower was eventually rebuilt, but not the choir. The restoration began by a great effort, in which most of the people of Scarborough participated in 1849, but under circumstances which deprived the church of much of its previous architectural beauty. On St. James's Day 1850 the church as they saw it at present was opened for Divine service, and ever since they had observed St. James's Day in commemoration of that event.

## THE ANCIENT CITY OF COPAN.

IN a fertile river valley, shut in by the high forest-covered mountains of northern Honduras, are the ruined pyramids, terraces, temples and other edifices of the ancient city of Copan. Until recently little was known regarding the extent of the ruins which lay beneath the accumulated mould of centuries. Monolithic monuments, of sculptured stone were scattered here and there in the almost impenetrable forest of ceiba and cedar trees. These, together with a few of the more important pyramids, were known to the natives and were pointed out to occasional travellers. The extent and real nature of the ruins, however, remained unknown until 1885, when A. P. Maudslay, an English archaeologist, visited Copan, made some excavations and prepared a plan. In 1891 Prof. F. W. Putnam, of the Peabody Museum of Archaeology and Ethnology, of Harvard University, organised an expedition for the careful exploration of the ancient city. For four seasons, says the *Scientific American*, the work of excavating has progressed successfully. The forests have been cleared away, and the accumulation of earth and vegetable mould has been removed from the temples, terraces, pyramids and courts of the main structure and the ruins immediately surrounding it.

The Copan river flows by the side of the principal group of ruins, and the eastern slope of the main structure has been undermined and carried away by the river floods, exposing a section which forms a cliff of rubble interspersed with walls of faced stone. This cliff is over 600 feet in length, and at one point attains a height of nearly 135 feet.

The main structure covers seven acres of ground, and consists of a vast irregular pile of terraces, flights of steps and pyramids crowned with the remains of temples built of squared stone. Some of the stairways and portions of both the exterior and interior of the temples were elaborately sculptured, and the buildings were originally painted in brilliant colours.

This structure contains two great courts or amphitheatres, whose cement floors are 65 feet above the river. Tiers of steps or seats are upon three sides of the eastern court, and the Jaguar stairway, so called from the finely sculptured jaguars which guard the lower steps, leads from the western side of the court to the terrace above.

One ascends the main structure by a flight of well-preserved stone steps 250 feet in width. From the first landing rises a pyramid, upon whose summit are the remains of a temple 100 feet in length. A step in front of an inner door of this temple is ornamented with seated human figures covered with elaborate breastplates and other ornaments.

The sides of the doorway and the cornice which had fallen

were in like manner covered with well-executed carvings in stone. Other portions of the building, which was in an advanced stage of ruin, were elaborately ornamented with sculptures, and the wall surfaces showed traces of plaster which had been painted.

From this temple a broad flight of steps descends to an elevated court. Within this court are sculptured monuments and a broad platform with terraced sides.

Rising from the eastern side of this court is a pyramidal mound supporting a ruined temple. The sides of the pyramid are built of squared stone regularly laid in terraces. The temple is reached by a stairway divided for a part of its length by a raised structure in the form of steps, having in front rows of sculptured death's heads. The cornice of the temple was ornamented by small sculptured heads, both human and grotesque.

From the summit of the pyramid, which is 100 feet in height, one obtains a view of the extensive ruins to the south and west. Near the northern base of the pyramid is the eastern court before referred to, nearly inclosed by ranges of steps. The northern range of steps of this court leads to a platform in front of three ruined temples, the largest of these being probably the most elaborate building of the ancient city.

In front of the principal inner doorway is a step carved upon its face with hieroglyphs and skulls, and at either end of the step is a human figure sculptured in stone, seated upon an immense skull and holding in its hand the head of a dragon, whose body, together with other figures, forms the ornamentation of the cornice over the door. The upper part of the outer wall of this temple had been ornamented by artistically sculptured half-length figures in full relief, representing girls in the act of clapping hands.

Two stone incense burners in the form of grotesque heads were found within the inner chamber of this temple.

Adjoining the mound upon which this temple stands is another pyramid with three sides sloping to the level of the plane upon which the main structure is built. Upon the western side of this pyramid is the hieroglyphic stairway, one of the grandest pieces of architecture of ancient America. This stairway is about 40 feet in width, and it leads to the temple upon the pyramid, a distance of more than 100 feet. At the foot of the stairway and occupying a central position is an elaborately carved pedestal. The face of each step of the stairway is covered with finely sculptured glyphs composed of grotesque faces, masks, scrolls and numerals, records of the ancient builders. Scattered throughout the *débris* are fragments of life-sized human figures carved in full relief, which once formed portions of the structure.

From the summit of the mound of the hieroglyphic stairway one obtains an extensive view of the Great Plaza of Copan, with its surrounding steps, terraces and mounds. The Great Plaza and its extensions occupy over 7 acres, and portions of it are paved with squared stones neatly fitted together.

Within the plaza are thirteen great sculptured monolithic monuments, and before each stands a carved block of stone called an altar. The average height of these monuments is about 12 feet, and the largest of them are about 3 feet in width and a little less in thickness. One side of the monument is usually sculptured to represent a colossal human figure wearing an elaborate headdress composed of the upper portion of the head of a quadruped, from which rise great plumes of feather-work. Massive ear ornaments adorn the ears of the figure, bead necklaces surround the neck, and elaborate garments of textile fabric, with tasselled fringe, cover the shoulders, and sashes, garters, bracelets and a profusion of ornaments decorate the lower portion of the sculpture.

Elaborate symbolical decorations derived from the great plumed serpent form a conspicuous part of the ornamentation, and the sides and back of these monoliths are usually covered by glyphs, which, when deciphered, will probably tell us much regarding the personages whose sculptured representations appear upon the stones.

The altars standing before the monuments are of various sizes, and are also elaborately sculptured—some in the form of a grotesque animal or head, others having a row of human figures encircling them. The tops of the altars are frequently covered with glyphs.

Excavations were made beneath several of the monuments, and cross shaped vaults were found containing numerous jars of earthenware, some of which were decorated with well-executed drawings of human figures and glyphs. The jars contained bones of small quadrupeds, sacred shells, and pigments of different colours. A few of the shells inclosed sacred objects, such as black oxide of mercury, cinnabar, worked jadeite and a few pearls.

During the excavations a number of underground tombs were encountered, built of squared stone. These tombs were miniature reproductions of the rooms of the temples, and within them lay the crumbling skeletons of priests, surrounded with jars, food bowls and personal ornaments, together with the paraphernalia of their priestly office.

The upper front teeth of several skeletons were ornamented with circular discs of green jadeite, highly polished and having convex surfaces. The discs were inserted in holes drilled in the front of the teeth, and were securely fastened by red cement. The cutting edges of the incisors and canines were either ground smooth or notched.

The burial place of the common people of the ancient city has not yet been discovered. It is probable that the remains found in the tombs are of priests or important personages, and that the elaborately decorated human figures upon the monuments, stairways and buildings are effigies of gods whom the priests and rulers personified.

In studying the photographs, drawings, sculptures and other objects gathered by the Copan expedition and exhibited in the Peabody Museum at Cambridge, one becomes impressed with the grandeur of the ancient city.

As to the age of these ruins, there are not sufficient data upon which to base a reliable conclusion. They are unquestionably prehistoric, and the builders of this city belonged to the same civilisation as the constructors of the temples and pyramids of Yucatan. Judging from the ruined condition of the edifices of Copan, this city must be older than most of the cities of Yucatan, and more magnificent also.

### THE ROMAN BARGES OF LAKE NEMI.

THE efforts to raise the barge which was discovered at the bottom of Lake Nemi, and which, according to tradition, belonged to the Emperor Tiberius, have been described in these columns. According to a correspondent of the *Scotsman*, the Cavaliere Malfatti, of the naval engineering department, is in charge of the operations, and as the best means of securing the treasure trove recommends lowering the level of the lake by temporarily reducing its volume. Rendered shallower by the removal of 13 metres of water the lake would yield up the first barge in its integrity, while a lowering of the level by 22 metres would place the second equally within reach. Direct hoisting of the barges from their beds, according to the Cavaliere Malfatti, would bring only their skeletons to the surface, if indeed they retained enough resisting power to give themselves up without loss of framework or contents. The Cavaliere estimates the cost of lowering the lake's level at 250,000 lire (10,000*l.*), and promises to secure thereby not only the barges themselves uninjured, but whatever objects of interest and value may be found in their keeping. Once placed high and dry the barges could be so studied and rehabilitated as to minimise the risks of their more minute exploration and ultimate transport to one or other of the archaeological museums. Whether this study and rehabilitation would best be carried out on the barges left *in situ*, or moved to a convenient place on the bank, the Cavaliere Malfatti reserves for subsequent consideration. Meanwhile, if his draining or pumping operations are fairly started, it will be curious to note whether he has not underestimated their difficulty. Lake Fucino for centuries defied all such attempts to dry it out of existence, and the millionaire, Prince Torlonia, succeeded only after it had long become a proverb that "Torlonia would drain Fucino, or Fucino would drain Torlonia."

### SALISBURY CATHEDRAL.

AT a committee meeting of the Dean and Chapter of Salisbury and the leading laity in the diocese recently held at the Deanery it was resolved that no time be lost in placing before the public the urgent need of further aid for the repair of the tower and spire of Salisbury Cathedral. The tower has been strengthened, under the direction of Sir Arthur Blomfield, in every way possible; the shattered stones are being replaced by others of a more durable nature, and the foundations have been carefully examined and restored. During the past twelve months every effort has been made in the locality to raise the sum required, viz. 15,000*l.*, to carry out the restoration in its entirety, and Sir Arthur Blomfield gives assurance that he does not anticipate that his original estimate will be exceeded, and that the actual expenditure has come within the calculations made for the work actually dealt with up to the present. The sum of nearly 10,000*l.* has been raised, and the committee are now confronted with the difficulty that it is practically impossible to raise the further sum required in the diocese, which it is well known has acutely suffered from continued agricultural depression in the south-west of England. Considering the national interest evinced in the cathedral and its spire, the committee feel that the time has come when they may reasonably appeal to the public at large to help them to secure the balance of 5,000*l.* which is required to render the tower and spire safe for future generations and to preserve in its integrity this beautiful example of cathedral architecture.

### Celtic Interlaced Ornament.

SIR,—I have read the article in your issue of January 1 on this subject by the author of "Charles Lowder" with considerable interest, and I am glad that the importance of Mr. Cooke Trench's theories on the true method of setting out interlaced work is beginning to be appreciated. I think, however, that, in fairness to me, the author of the article should have stated, what is most courteously acknowledged by Mr. Cooke Trench in his paper in the "Journal of the County Kildare Archaeological Society" (vol. i. 1894, p. 240), namely, that I had independently arrived at the same conclusion as he had.

My opinion that the most common varieties of Celtic knotwork were derived from plain plaitwork by introducing breaks at intervals (as explained in the article in last week's *Architect*) was clearly expressed in a paper on the subject published as far back as 1883 in the "Proceedings of the Society of Antiquaries of Scotland" (vol. xvii. p. 236), and further enlarged upon in papers on the "Cylindrical Pillar at Llantwit Major, Glamorganshire" ("Archæologia Cambrensis" for 1889, p. 317); "The Cross of Eudon at Golden Grove, Carmarthenshire" (*Ibid.* for 1893, p. 48); and on the "Early Sculptured Stones of the West Riding of Yorkshire" ("Journal of the British Archaeological Association" for 1890, p. 301).

It is satisfactory to find that two persons working at the problem from entirely different sides—the one analysing ancient examples, and the other endeavouring to find out how to design new patterns—should quite independently have reached the same conclusion. I need only add that in the work on the "Early Christian Monuments of Scotland," which is now in the press for the Society of Antiquaries of Scotland, I have treated exhaustively the whole question of the evolution of the more elaborate forms of interlaced work from a simple plait.—I remain, yours truly,

J. ROMILLY ALLEN, F.S.A.

28 Great Ormond Street, London, W.C.

### GENERAL.

**Professor Kernot** has been re-elected dean of the faculty of engineering in the University of Melbourne.

**Mr. John Finnie** has resigned the head-mastership of the Liverpool School of Art, which he has held for about forty years.

**The Paris Municipal Council** have voted 41,000 frs. for the erection of a monument in Père-Lachaise which is to mark the burial-place of the municipal workmen. It will be designed by M. Duprez, architect, and the sculpture will be the work of M. Denys Puech.

**M. Hébert**, the French painter, whose *Peasants of Chevannes* was reproduced in *The Architect*, has been raised to the dignity of Grand Officer of the Legion of Honour, the highest attainable.

**Mr. Joseph Griggs**, first mayor of Loughborough, has offered to erect a technical institute and public baths at Loughborough in commemoration of the Queen's reign. The offer has been accepted by the Council.

**The Fiftieth Anniversary** of the French School in Athens is to be celebrated on April 20 by a performance of "Edipe Roi," an adaptation from Sophocles, in the theatre of Bacchus, at the foot of the Acropolis, by actors from the Théâtre Français, who will be sent to the Greek capital at a cost of 1,000*l.*

**The Statue** of the late John Bright, by Mr. A. Gilbert, R.A., was removed on Tuesday from the outer lobby of the House of Commons by order of the First Commissioner of Works.

**The Opéra Comique** in Paris, when completed, is to be decorated by able artists. The cupola is to be entrusted to M. Benjamin-Constant, and the grand staircase to MM. Luc-Olivier Merson and Flameng. A special commission will shortly arrange for the remaining works.

**The Applied Art Section** of the Society of Arts will begin meeting on the 26th, when a paper on "The Artistic Treatment of Heraldry" will be read by Mr. W. H. St. John Hope, M.A. At subsequent meetings the following papers will be read:—"Lithography as a Mode of Artistic Expression," by Mr. George McCulloch; "Gesso," by Mr. Matthew Webb; "Lead-work," by Mr. W. R. Lethaby; "Delft Ware," by Dr. J. W. L. Glaisher, F.R.S.; "A Half Century of Line Engraving, 1780-1830," by Mr. George Chulow.

**The Plans** sent in by Mr. J. H. Swainson, Wrexham, for the new church to be called St. Peter's, and to be erected at Rhosrobin, in the parish of Rhosddu, a suburb of Wrexham, have been adopted by the building committee.

# The Architect.

## THE WEEK.

WE publish the "specification" prepared by the Society for the Protection of Ancient Buildings, at the request of the Society of Antiquaries, to show how the northern gable and its supporting arch at Peterborough Cathedral can be repaired without adopting the method approved by the Dean and Chapter. When it is remembered how many able architects are members of the Society of Antiquaries, it was somewhat undignified to shirk the duty of devising a scheme of reparation for which the Society would be responsible and to commit the task to others. When the Society for the Protection of Ancient Buildings undertook the task, it is to be regretted that the preparation of the specification was not entrusted to members who have had as much experience with restoration, or with masonry construction and underpinning, as Mr. PEARSON and Sir A. BLOMFIELD. The multitude of letters and articles on the subject of the restoration suggest that the victory is not to be gained by means of written or printed arguments, which in such a case are futile. What is desirable is to ascertain on which side will men possessing most experience be found. For that reason we recommended at the beginning that the Dean and Chapter should seek the judgment of one or two prominent engineers (as was done formerly at Lincoln Cathedral), who would consider the proposals without any bias of sentiment, and therefore free from what easily perverts the judgment. Or a committee of independent architects could be consulted. The controversy appears to be as far as ever from an end, and no doubt it will continue until Parliament meets and the columns of newspapers will be occupied with subjects that are not archæological. But up to the present no impartial judge has appeared, for those who have joined in the conflict could not take a different side without being exposed to a charge of inconsistency. The Dean and Chapter are responsible for the safety of the building, at least in theory, and it would be difficult for a higher authority to interfere with their privileges; but there never was a building case in which it was more advisable for a Government to interfere and nominate a committee of inquiry than the "Preservation of the Western Front of Peterborough Cathedral."

THE difference between misfeasance and nonfeasance was exemplified in the Court of Appeal on Tuesday. The plaintiff owned houses in Peter Street, Workington, which were damaged through being flooded by sewers which were constructed by the Corporation of the town. In the assumption that by the Public Health Act of 1875 the Corporation were liable for any neglect of duty imposed on them by that Act, plaintiff sought to recover damages from them. The action was tried by Mr. Justice CAVE, who nonsuited the plaintiff because his lordship held there was no evidence of misfeasance, while for the nonfeasance the remedy provided by the Act was either an application to the Local Government Board or to the courts for a writ of mandamus. The plaintiff applied for a new trial. The Master of the Rolls and the Lords Justices held that section 299 of the Public Health Act provided the only remedy in cases of nonfeasance, which was an application to the Local Government Board or to the courts for a mandamus. There was no remedy for misfeasance. In other words, it is not penal under the Public Health Act to construct sewers of inadequate dimensions, but a neglect to construct them, whether adequate or inadequate, makes a local authority liable to a mandamus or an intimation from the Local Government Board.

THE decision given by Lord Justice CHITTY in *LIST v. THARP* on Wednesday is important to speculative builders and others in London, as it proves that the privileges, as well as the responsibilities, attached to the ownership or tenancy of a site may commence before the deeds, conveyances or leases are completed. The case in question arose out of a simple cause—a neglect on the part of the defendant to give a notice relating to a party wall or party fence wall to the plaintiff, or, in other words, did not recognise him as an adjoining owner. The plaintiff had entered into an agree-

ment with Sir CHARLES OPPENHEIMER in December 1894, for the demise of property held under the Commissioners of Woods and Forests, the rent being 550*l.* It was agreed that buildings of the value of 100,000*l.* were to be erected, and the production of a certificate of their completion from the Surveyor of the Commissioners was to be a condition precedent to the granting of the lease. When the buildings were near completion the defendant, who wished to have some works executed in connection with the wall, in February 1896, served notices on Sir C. OPPENHEIMER, but ignored the plaintiff. An *ex parte* interim injunction was applied for and obtained by the plaintiff (although a lease was not granted until August, 1896), to restrain the defendant as building owner from interfering with the wall. It was now sought to continue the injunction until the case was tried. Lord Justice CHITTY held that a man is not the less in possession because as between himself and the person from whom he receives it he is under a contractual obligation to use the property for some particular purpose, as, for instance, when he is under a covenant to use a house for the purpose of a private dwelling-house only. The plaintiff, after his entry on the land, was in possession as between himself and Sir C. OPPENHEIMER, although he was bound by the contract as to the user of the land. As against strangers he had all the ordinary rights and remedies incidental to possession. His lordship, therefore, approved of the continuation of the injunction, but declined to consider what was the character of the wall in question, whether it was a party wall or a party fence wall.

ON Wednesday a meeting was held at Mercers' Hall, to receive a report of a special committee appointed to inquire into the expenditure of the Central College of the City and Guilds of London Institute. The inquiry arose out of a pamphlet with the title "Is the Central College a Failure?" The special committee appointed sub-committees, whose reports were adopted. It was stated that in the opinion of the committee the governors possess in the Central Technical College an institution which has well and economically carried out the objects for which it was founded, which objects are deserving of every support and encouragement that the Corporation and City Companies of London can give them. The expenditure of the college for 1895, which includes a sum of 502*l.* for apparatus and books, was 11,682*l.*, and the receipts from students 4,933*l.*, making the net cost to the Institute 6,689*l.*, which compared favourably not only with the original estimate, but with the four years preceding. The original estimate of the gross cost per student was 75*l.* During the past two financial years, taken together, with 210 students, the gross cost, excluding board and lodging, was 54*l.*, and the net cost 31*l.* These figures are lower than the cost at Coopers Hill, the Royal College of Science, the Massachusetts Institute, the Cornell University, Johns Hopkins University, McGill University (applied science), similar institutions in Germany and at the Zurich Polytechnic. There are four professors who receive 1,000*l.* a year without any share of students' fees, which the committee consider is by no means excessive. On the contrary, if their position is compared with that of professors in the older universities, in the Royal College of Science and in some of the provincial colleges, it is found that several of the professors in other institutions are more highly remunerated and enjoy at the same time a larger measure of liberty. At Liverpool the payment to the professor of physics for the year 1894-95 was 1,177*l.* 16*s.* 7*d.*, to the professor of engineering, 1,039*l.* 17*s.* 7*d.* At University College, London, the payment to the professor of chemistry for the same year was 1,100*l.* 13*s.* 4*d.* At Owens College, Manchester, the professor of mathematics received 1,048*l.* 6*s.* 8*d.*, the professor of chemistry 1,220*l.* 13*s.* 8*d.*, the professor of physics 909*l.* 9*s.* 8*d.*, and the professor of engineering 916*l.* 11*s.* 8*d.* At the Royal College of Science the emoluments of the professors of mechanics, chemistry, physics and geology range from 600*l.* to 1,000*l.*, with a retiring pension, but they may also receive additional fees for the annual examinations of the Science and Art Department. At the Scotch Universities the salaries of the science professors are considerably higher. At the meeting on Wednesday it was decided to receive and circulate the report as being satisfactory to the Institute.

## THE LEIGHTON EXHIBITION.—II.

THE three works in the exhibition of the Royal Academy which belong to the year 1872 differ in character. *After Vespers* is a figure of a girl in an Italian church holding a rosary in her right hand. She is somewhat listless in appearance, and apparently was only a model employed to enable LEIGHTON to paint a beautiful dress of green brocade. The colour pleased him. Costume was occupying his attention at the time, for the design for his first lunette at South Kensington, *The Industrial Arts as applied to War*, also belongs to 1872. It must be admitted that the artist, however skilful in composition, was not as successful as was anticipated in his colour scheme for so many figures. The picture itself is therefore disappointing, but the design which is in the Academy is one of LEIGHTON'S noblest works. There is not one figure which is unsatisfactory, and, although subservient to restraint as becomes a piece of decoration, the groups are suggestive of the animation which might be supposed in an Italian city when war was imminent, which was not unusual. Of course, there is idealising throughout. There is no suggestion of controlling power, for the youthful warriors are all in common inspired by patriotism. Disciplined veterans are also absent, as well as soldiers who are drawn from the ranks of labour. All might be said to be representatives of a patrician class; all are lithe and slim and flexible. Their attitudinising is consequently not unnatural. In many points the design recalls MACLISE'S chivalric compositions, but LEIGHTON was less acquainted with the anatomy of the human figure, or considered smooth surfaces were better suited in decorative pictures. The *Summer Moon* is another piece of decoration in which a circular opening or unglazed window in a building is combined with figures of two girls with clasped hands, who are asleep in front of it. The painting suggests LEIGHTON'S ability to adapt figures to any kind of space.

The work of 1873 is not unlike that of 1872. *The Industrial Arts as applied to Peace*, of which the finished work is also in South Kensington, is inspired apparently by the belief that as women are to be admired they are most fittingly employed when endeavouring to make themselves attractive. The central compartment is, therefore, a dressing-room. It is open in front to a canal, river, or seashore, but the boatmen who carry wares to the women, although they have eyes, are not supposed to see. Spectators appeared to be disagreeable elements to LEIGHTON, and he either ignored them or treated them as if they would not look at his charming figures. *Moretta* is another girl in a green dress, and *Weaving the Wreath* shows a child, who wears a garland of leaves, seated in front of a bas-relief and engaged in weaving one for a companion in a spectacle. The picture is small, but from the simplicity and naturalness of the subject and the excellence of the workmanship it will be preferred by many visitors to some of the larger canvases. The companion, *Study*, produced in 1877, is a still more delightful cabinet picture. The little girl who finds it is possible to be tired with the contemplation of pictures was never surpassed by MILLAIS or REYNOLDS. The pink-flowered robe, inlaid book-stand, dark unglazed blue tiles, which are marvels of softness, and luxurious carpets, are painted with extraordinary care, and seem to enhance the beauty of the child's face. She is seen again, but a little older, in *Kittens*. The *Antique Juggling Girl*, of 1874, presents a nude figure tossing balls in front of a narrow strip of curtain with delicate bordering, while on the ground are a sword, vase and other "properties." The curtain is of a pale yellow, and consequently there is no such contrast between it and the figure as would be inevitable if the luxuriant peach trees of the background were not screened. Another work of 1874, the *Moorish Garden*, a *Dream of Granada*, reveals LEIGHTON under a new aspect, and from its beauty is enough to excite a doubt whether he would not have been more successful if he devoted himself to the "Arabian Nights" than to Greek mythology. The scene is a vision of cypresses, leafy arches, land and water in one of those "high-walled gardens, green and old," which were created as if to anticipate the Mussulman's paradise. Eastern influence is also seen in the *Slinger* standing on his raised platform, the interior of the *Grand Mosque of Damascus*, the artist's most elaborate painting of architectural work, and the *Little Fatima*, which belong to 1875.

In 1876, however, the *Daphnephoria* proved that LEIGHTON'S allegiance was again faithful to ancient Greece. That procession is comparable to the one which KEATS has described in "Endymion," and both painter and poet have imparted life to traditions with a success which archæologists must envy. The *Daphnephoria* is alone sufficient to form an exhibition, and the opportunities to see it should always be seized. Among the Greek scenes it holds the foremost place, and by a coincidence it was accompanied by the painter's masterpiece in portraiture, his *Sir Richard Burton*. The principal work of 1877 was the *Athlete struggling with a Python*, of which an excellent cast is in the Academy. The athlete is a type of the majority of LEIGHTON'S figures, agile and vigorous, but slight. The *Music Lesson* is an Eastern scene—one girl teaching another to play on a stringed instrument. The seat on which they rest is so high that their feet do not touch the ground, and those of the elder girl are so close together as to appear a deformity when seen at a distance. The paintings which were produced in subsequent years suggest that LEIGHTON rarely cared to depict costume that could be called Eastern. Although the robes were worn by men and women who were supposed to be Greeks, there was no archæological exactness in the forms. LEIGHTON could paint the nude, but for the sake of contrast he preferred to employ a vesture which suggested rather than concealed the form. The *Nymph of the Dargle*, an Irish inspiration, was originally called *Crenaia*, an adaptation apparently of the name of the Irish girl (NORA CREINA) whose dress corresponded with the artist's idea of what should be worn by womankind, and which FATHER PROUT pleasantly describes:

Nōte tunicam præferres  
Plante zephyrō volantem;  
Oculis et raptis erres  
Contemplando ambulātem  
Veste Norā tam decorā  
Semper indui memento,  
Semper puræ sic naturæ  
Ibis tecta vestimento.

Wherever she originated, *Crenaia* makes a prettier picture than *Iosephane*, who is clad in a greenish-yellow drapery, and has marble columns for a background. Green is also the colour of the robe of the elder girl in a *Sister's Kiss*, a simple subject but made charming by art. For a few years LEIGHTON was contented to paint pictures that were no less free from passion or fervour, and single figures, *Whispers*, *Idyll*, *Bianca*, *Day Dreams*, *Vestal*, and *Kittens* are examples. Any or all of them might be hung in a bishop's house without offending the most fastidious censor. In 1884 was produced the *Cymon and Iphigenia*, which surpasses all known versions of the subject. The official description is accurate when it says: "IPHIGENIA in white drapery is lying asleep under the shade of a large tree with her arms above her head; several attendants asleep near her; on the right the figure of CYMON in red drapery gazing down at her; sea in the distance, with the moon rising." The elements of the picture are inventoried, but the words cannot suggest the beauty which seems to emanate from all parts of the canvas. The quality is so genuine, it is natural to suppose it must, like all earthly beauty, be only evanescent. For that reason this picture and the other tribute to sleep, *Summer Slumber*—the last of LEIGHTON'S masterpieces—will, we trust, be treated reverently by time and fate.

The President's work of 1885 is one portrait, and for 1886 the statue of the *Sluggard* and a statuette, *Needless Alarms*, a girl looking over her shoulder at a frog. The *Jealousy of Simoetha the Sorceress*, a rather wicked-looking woman dressed in pale orange and white, with her head turned aside as if gazing at some unpleasing spectacle, and the *Last Watch of Hero*, who is gazing sadly from a window, were the paintings of 1887. The year 1888 is memorable by the production of *Captive Andromache*, which in size comes after the *Cimabue's Madonna* and the *Daphnephoria*. When exhibited, it was hung in the place now occupied by the *Procession*, and we imagine it looked better in its former than in its present position. It continues to be one of the painfulest of pictures, for it brings before us the cruelty of the heroic age, and yet a worse scene might be painted from the woes which were imagined by HECTOR for his wife. LEIGHTON had not much

data to inspire him. All that the diffuse CHAPMAN could make out of HECTOR's vision was the following:—

When some rude Greek shall lead thee weeping hence,  
These free days clouded, and a night of captive violence  
Loading thy temples, out of which thine eyes must never see,  
But spin the Greek wives' webs of task, and their fetch-water be  
To Argos, from Messeides' or clear Hyperia's spring;  
Which howsoever thou abhor'st, Fate's such a shrewish thing,  
She will be mistress; whose cursed hands, when they shall crush  
out cries

From thy oppressions (being beheld by other enemies),  
Thus they will nourish thy extremes: "This dame was Hector's wife,  
A man that at the wars of Troy did breathe the worthiest life  
Of all their army."

The picture raises a point in what may be called the ethics of art. HECTOR anticipated that his wife was soon to experience the usual fate of women who were spoils of war. But when ANDROMACHE fell into the hands of the rugged but youthful PYRRHUS she was treated as a princess, and subsequently she became the wife of the priest HELENUS, her brother-in-law. ANDROMACHE was not probably honoured by flatteries like those which RACINE puts into the mouth of PYRRHUS, and which in the English version recalled to Sir ROGER DE COVERLEY his own manner of trying to persuade the perverse widow. The Frenchman, however, although he supposes she was a coquette, may have come nearer the conduct of the Greeks than the painter. They were finer gentlemen than those in the court of LOUIS XIV., and as such could be respectful to fallen greatness. It is no evidence of either scholarship or insight to make them out savages. The appointment of a professor of ancient history in the Academy was intended as a means to prevent such exaggerations. Mr. GLADSTONE, who holds the office, may approve of the treatment to which ANDROMACHE is subjected in the picture, but no foreign Academician would hazard that sort of interpretation. Whether LEIGHTON was correct or not, he produced a most impressive scene. The sudden stoppage of ANDROMACHE on seeing a group of a young mother and her child that recalled happy days in Troy, and the neglect to press forward to the well, is admirable. She almost appears to shiver. The rather boisterous women who draw water are useful as contrasts, but there is a little too much of the London working-men about the fellows who pass along the road and point at the captive. The figures appear too scattered, but that effect is owing mainly to the colouring.

A sort of priestess in white with her arms elevated, *Invocation*, and a *Sibyl* that appears attenuated if compared with the muscular women of the Sistine, were exhibited in 1889. A thought-worn *Tragic Poetess* with numerous scrolls beside her, a nude figure standing in front of dark purple curtains, called the *Bath of Psyche*, and a girl leaning against a column in the *Marble Hall* are the works of 1890. In 1891 the *Return of Persephone* appeared so expressive of joy at the meeting of mother and daughter that the shortcomings of the figures were not noticed. The *Perseus and Andromeda* gave opportunity for creating a monster that is not without originality. It is not so terrible as the unsurpassed dragon which is seen in TURNER'S picture in the National Gallery, but it differs from those seen in most ancient and modern pictures of the subject, as it is not ridiculous, and it seems to overshadow the girl like a pall. But by placing PERSEUS in the sky, from where he can send arrows at his ease, for he is safe from a scratch, he is made to appear less courageous than befits a hero. The light and shade in this picture indicated an advance beyond its predecessors. In the *Garden of the Hesperides*, painted in 1892, that quality is again manifest, but with such unprecedented force in the colouring, we seem to have before us some torrid region where serpents assume dazzling colours. The *Clytie*, of 1892, is a landscape or cloudscape, with the figure of the girl in adoration kneeling beside a column bearing a figure of the sun-god. Some painters adhere to the CLAUDE tradition, and profess to give away gratuitously such figures to the purchaser of the landscape. LEIGHTON had a remarkable prepossession for his first thoughts, as if they were divinely inspired. The small figure was afterwards enlarged, and depicted unaltered as the *Clytie* of 1896. He acted wisely in again presenting it to the world. LEIGHTON'S occasional weakness in colour is manifest in *And the Sea gave up the Dead which were in it*. The

painting is less effective than the cartoon, which was reproduced in *The Architect*. If durability was desired for the design it should have been as a relief. In marble or bronze the difficulties inherent in the subject would not be so obtrusive.

There are four works belonging to 1893 and all successful. In *Hit*, the artist contrasted flesh with flesh, a wood in the back serving as a foil to the two figures, one a child who is receiving a lesson in archery from a youth. *Corinna of Tanagra* is seen crowned with laurel and resting her hands on one of those ancient lyres which were difficult to carry. As *Atalanta* is no more than a bust, there can be no certainty whether the figure represents the racing girl. *Farewell* is a girl whose expression is sad, standing on a terrace near the sea. *Fatidica* suggests a Greek PORTIA, and is a girl in white drapery seated near a silver tripod. The *Spirit of the Summit* is also cold in colour. The *Bracelet* represents a girl in light-coloured drapery, and evidently in 1894 LEIGHTON avoided rich colouring. The following year he was in another mood, of which the orange-robed *Flaming June* and the *Twixt Hope and Fear*, a girl in dark green and white, are evidence. The four unfinished figures, exhibited in 1896, indicate that they were also to be experiments in colour.

There are many more works in the Academy Exhibition which have unusual interest. The water-colour *Algerine Girl*, although it could be painted on a lady's visiting card, is as characteristic of LEIGHTON as any of his large single figures. The studies are also more suggestive of preparatory work than those we lately noticed. There are also sketches for works which are not found in the exhibition, such as the brilliant one for the fresco of the *Wise and Foolish Virgins* in Lyndhurst Church, which was copied in *The Architect*; the sketch of *Music*, a fine decorative frieze in a house in Mayfair; vigorous landscape sketches, and architectural sketches such as the *Doorway, North Aisle of St. Mark's, Venice*, the *Erechtheum*, &c. One advantage of the exhibition is that it will dispel the notions about the facility with which Lord LEIGHTON produced pictures. It is made evident that he went through as much toil as any ordinary artist. Even his landscape backgrounds appear to have been derived from nature. The pictures by themselves are evidence of extraordinary industry as well as of power, but when supplemented by the statues and studies, the collection forms a life-work that has been rarely surpassed in quantity or in quality.

## CHARACTERISTICS OF SOME GREAT LONDON THOROUGHFARES.—III.

[BY A CORRESPONDENT.]

THE approaches to London from the west are much more familiar to a large number of its inhabitants than the roads at the east end. So it may be of interest to make a few observations in this direction, beginning at Bow, otherwise called St. Mary Stratford-le-Bow, the parish church of which has been lately threatened with demolition. It is, by the way, somewhat remarkable that in the case of two well-known churches in London, viz. St. Mary-le-Bow, Cheapside,\* and Allhallows, Barking, their designations are so much like those of parish churches a very few miles further east—at Bow, which is often overshadowed in its importance by its great neighbour, Stratford; and at Barking, Essex, where the outfall of the main drainage system of London is situated. It would be curious to inquire what is the proportional number of people living in this great city who have seen *Peterborough* Cathedral, as compared with those who know the venerable old church at Bow. For WREN'S noble church in Cheapside is familiarly termed Bow Church. The former is not one of those buildings in "a hole and corner," for there it stands surrounded by a diminutive graveyard, with its trees, a landmark to all passers-by, an object that the most unobservant could not possibly help seeing. Maybe, the churchyard was originally larger, and there was not a highway on

\* To the further confusion of many, the mother church of a great London parish is called St. Marylebone, or, more correctly, St. Mary-le-Bone.

both sides of it as now, but only on one side. Unfortunately, this structure has become very dilapidated, and, notwithstanding its archaeological interest, the grey old stone tower, with the brick nave and chancel, "block the road" and are "in the way," or, as the omnibus-driver naively told the writer, "the building is of no use, being out of repair." Now, quite independent of any theological or antiquarian reasons, which ought certainly to have great weight, the writer maintains that this church is a great and distinct characteristic of an important London thoroughfare. If swept away, a prominent feature visible a long way off from the west, and also conspicuous as approached from the east, would be lost for all time. It is absurd to say the exigencies of the traffic demand the removal of this historic building, for the road on either side of it is of fair width. It is sincerely to be hoped that a determined effort will be made, and successfully made too, to ward off this threatened act of most unnecessary Vandalism. If those people in London who, with imperfect knowledge of the facts, are endeavouring to thwart the praiseworthy efforts of the Dean and Chapter of Peterborough, would turn their attention much nearer home and save Bow Church from destruction, they would be better serving public interests. Before quitting the subject of Bow, it is worth drawing attention to the remarkable and, it is believed, unique sign of the tavern a little to the east of the church, *i.e.* the Bombay Crab, where the London General omnibuses finish their journey. On inquiry there appeared to be one or two versions of the origin of the sign, but it is evident that it must have some connection with shipping, this hostelry being not far from some of the docks. The ancient church, viewed from this point, looking westwards up the rising road, is quite a picturesque object, which could be ill-spared. May that sad fate never happen to it is the fervent wish of the writer, and of many, many others, he is convinced!

Though the Mile End Road cannot be said to possess the beauty of some other great highways leading into London, such as that from Hammersmith and then on to Piccadilly, it yet has its own peculiar elements of interest, and when the young trees which the authorities have wisely planted along it have grown larger, the dull monotony of so many yards of "brick and mortar" will be much relieved. Moreover, the trees will have a great advantage denied to them in roads in more pleasant localities, *i.e.* that of abundant space around them in which to air their branches. In truth, the ample width of the road and the very liberal allowance of footway, with plenty of room to spare, is quite a characteristic nearly all the way from Bow Church up to Aldgate. Though the road is slightly narrower in some places than in others, this, in point of effect to the eye, is better than if it had been more equable. Moreover, though it cannot be said that as a rule there is any beauty in the houses and other ordinary buildings along this route, they are of no great height, and this added to the broad road and footpaths gives an appearance of light and air and spaciousness quite foreign to many other large thoroughfares some way off from the centre of the Metropolis. The quiet and simple-looking though effective modern red brick church of St. Benet, in the Mile End Road (on the north side), is in strong contrast to the immense graveyard adjoining it, with its hundreds of white-looking stone ledger tombs, for none appear to be of the more usual character. Though the great brewery, also on the north side of this thoroughfare, has a modern appearance, it is yet on the site of a much older building devoted to the same purpose for satisfying the thirst of the inner man, and, though not beautiful, has a quaintness and absence of the commonplace which has always impressed the writer. This is caused by the curious-looking iron "flying bridges" and the kind of "flying buttress" structures of the same material so conspicuous in the higher part of the buildings, a part of the mechanism of the brewer's trade. The transmutation of the floor-cloth factory at Knightsbridge, nearly opposite the Horse Guards Barracks, has always been regretted by the writer. For, plain and "stuccoed" as it was, there was a massing in its parts and an evident adaptation to the requirements of the manufacturer based on the true spirit of the Middle Ages, though the architectural character was Italian in style. That portion of the building nearest the high road has been pulled down and reconstructed for quite another purpose,

and it is not easy now to realise how very different its appearance was before it was so considerably altered. There is another factory at Wandsworth, near the Thames, a prominent object as seen from near Clapham Junction Station, which, though only of stock-bricks and without any architectural pretensions whatever, has a distinct though faint resemblance to a Mediæval cruciform church with central tower and flying buttress therefrom. Of course, it is not pretended to say that any person would mistake it for anything else but what it was built for, but there is a certain element of picturesqueness in it which is lacking in some more pretentious and less matter-of-fact structures. But to return to the Mile End Road, its north side possesses, of course, something of greater archaeological interest than anything yet mentioned, *viz.* the old almshouses recently threatened with destruction, but now, it is believed, practically safe. Not far from these are other buildings of the same character, but not so venerable. Then there is the People's Palace, which it would be a matter of superfluity to comment upon here, being so well known. "Variety is charming," it is said, and there is plenty of it in this road in the way of public edifices, most of them being on the north side, except the great hospitals on the south. Though no half-timbered houses remain in this thoroughfare, there are others of somewhat later date, but not exactly picturesque, as they are covered with plain weather-boarding. One of the quaintest survivals of the "olden times" is the Vine Tavern, also on the north side, standing on the broad open space between the road and the houses, and quite detached, looking every inch a trespasser on land which ought clearly never to have been built upon.

The fine modern church of St. Mary Matfelon, White-chapel, is admirably placed so as to be well visible, as was the older one on its site. It rarely happens that an architect who passed away before attaining middle age is called upon to rebuild, owing to fire, a church erected so short a time before, as happened to the late ERNEST C. LEE. A relic of older London remains in the row of butchers' shops on the south side of Aldgate, and probably the majority of people would far prefer to see these rough-looking shops swept away, and the business carried on in a less prominent situation. But though to most minds the exhibition of the complete specimens of dissected oxen, sheep, &c., is not a pleasing one, the houses themselves, with the irregular lean-to sheds in front where the sale of the meat is carried on, are old and have quite a different character to the spick-and-span "places of business" of the "purveyors of meat" in more fashionable neighbourhoods. This gives them some element of picturesqueness. What a complete change takes place in the character of the thoroughfare and shops, &c., when Leadenhall Street is reached, as compared with the wide road which has existed all the way from Bow Church!

The writer has commented at some length on this eastern route out of London because, though comparatively level and nearly straight, conditions which militate against one of the elements that make a pleasing impression on the traveller, there is, on the other hand, a good deal of variety. In the country roads and lanes of some parts of this favoured land there are frequent strips of turf on either side, of varying width, such as utilitarians consider great waste of productive soil that ought to have been enclosed and rendered arable. Within about the twelve mile radius, on the outskirts of Epping Forest, such delightful little bits of greenery can be seen. Now the practical lesson which it is desired to teach from the examples just given is that not only is it a mistake to plan new streets as straight as if one were driving them with a gimlet, but that even where they are on a curve, like Shaftesbury Avenue and Charing Cross Road, the monotony of the two parallel enclosing lines should be varied by an occasional expansion where the thoroughfare is of considerable length, in some such manner as Waterloo Place. Both Victoria Street and Queen Victoria Street are monotonous and formal-looking in their long unbroken stretches, though in the case of the latter there is a change in the axis near where it crosses Cannon Street.

A stranger not familiar with London, in studying its map, would be sure to observe the marked continuous line of road from east to west, extending from Bow to Shepherd's Bush, or, to call it by the modern phraseology, Shepherd's

Bush Green. But the largest amount of traffic into London on its westward side is not by the Uxbridge Road and Notting Hill, along the north side of Kensington Gardens and Hyde Park. For, from sufficient reasons, the more important approach is that on the south side of the before-mentioned parks. There is probably no more beautiful road into the heart of the great Metropolis than that commencing at the Broadway, Hammersmith, with its gentle windings and easy gradients, the first glimpse of the tower and spire of St. Mary Abbotts' Church showing forth as if set in a wood as the Addison Road Station Bridge is reached. This effect tends to deceive a stranger, and is caused by the fine trees on the south side of Holland Park and by the winding of the high road. Yet the site of this important parish church is by no means an ideal one, having several drawbacks, being only open on two sides to streets, and is much shut in on the north and west. On the other hand, it is remarkable how a distant peep of the elegant spire is somewhat unexpectedly found out when about opposite the Knightsbridge Barracks. Shortly afterwards the upper part of the Albert Memorial is seen, but, though much further off and on rather lower ground, the Kensington spire is the first sighted, proving the truth that the *scale* of great buildings is a telling factor. They are not intended to be only looked at, like dolls'-houses, close to the spectator. Continuing the remarks about St. Mary Abbotts' spire, as observed from the main road, travelling west, the contour of the ground does not allow of more than the brief glance mentioned, and then nothing more is seen of the church till the threshold of the "Royal Court Suburb," as the house agents sometimes grandiloquently call it, is neared.

In concluding these observations on some of our great London thoroughfares, the writer hopes that, although he has been unable, necessarily, to avoid sometimes repeating what others may have better expressed when treating of this subject, yet he may have thrown new light in some cases on what was either obscured before or had not been noticed.

### THE ROLLS CHAPEL.\*

THE building recently known as the Rolls Chapel was originally the chapel of the House of Converts, which was founded by Henry III. for the reception of Jews who had embraced the Christian faith. The annals of that establishment offer various points of interest, but in the present report I propose to deal with those facts only which concern the chapel.

The earliest specific reference to the House of Converts occurs in a royal charter dated January 16, 1232, by which the founder assigned a yearly sum of 700 marks for the maintenance of the inmates, "and for the construction of their church and their buildings." Three months later he made provision for two chaplains celebrating divine service in the chapel which he had caused to be erected (*erigi*) for the use of the converts, which implies that the building was at any rate begun.

Matthew Paris, the chronicler of St. Albans, states that Henry III., about November in the seventeenth year of his reign, 1233, built at his own expense "a certain church proper and sufficient for a conventual congregation with some adjoining buildings" at the place where he established the House of Converts in London, not far from the Old Temple. Opposite to this passage there is in the margin of the MS. at Corpus Christi College, Cambridge, a coloured drawing of a small church, which has been supposed to be an actual representation of the chapel of the House of Converts as it existed between 1233 and 1259, the year of the chronicler's death. It certainly corresponds with the building in question in so far as it shows a nave of three bays, with a square turret projecting southward at the eastern end of it, and a short chancel with lancet windows, but other details have evidently been supplied from memory or from imagination. It should, moreover, be observed that the drawing near the corresponding passage in the shorter chronicle of Matthew Paris, preserved in the British Museum, is somewhat different. Furthermore, the architectural evidence throws some doubt upon the theory that the turret was part of the original fabric.

The original design of the chapel appears to have been altered as early as 1275, for in that year Edward I. authorised John de St. Denys, keeper of the House of Converts, to take stone from the side aisles of their chapel of the Holy Trinity, in order to extend the body thereof lengthways (*linealiter*). The

light of the Holy Trinity in the chapel of the Converts is mentioned in the will of one of the chaplains called Hugh de Convers, which was proved in 1274. The chapel, however, appears to have been dedicated to the Virgin Mary. Edward I., Edward II. and Edward III. alike made grants for the maintenance and adornment of the fabric.

Out of nine persons who were keepers of the House of Converts between 1307 and 1377 no less than eight were also keepers of the Rolls of Chancery, their secular services to the Crown being thus rewarded, in part at least, out of ecclesiastical revenues, and the arrangement proved so convenient that Edward III. in the last year of his reign definitely assigned the House of Converts to the clerk for the time being in charge of the Rolls of Chancery, granting the patronage of the offices thus amalgamated to the Chancellor of England or the Keeper of the Great Seal. His letters patent, dated 1377, recite that William de Burstall, the then keeper, had found the house, the chapel and other buildings in a ruinous state (*quasi totaliter in ruina*), and that he had spent a considerable amount of his own money in repairing them. This union of the two keeperships, so different in character, was at the request of Burstall and his successor confirmed in the following reign. Thenceforward the chapel of the House of Converts came to be known popularly as the Rolls Chapel.

Dr. John Yong, Master of the Rolls and Dean of York, who died in 1516, left directions in his will that his body should "be buried in the chapel of the Rollys," and "that a tombe" should "be made over the place of" his "sepulture." Richard Alington, of Lincoln's Inn, was buried in the chapel in 1561, his wife being a sister of Sir William Cordell, Master of the Rolls, and she was probably buried in the same vault in 1604. The next interment recorded is that of Edward, Lord Bruce of Kinloss, Master of the Rolls, who died in 1611. In that year his successor, Sir Edward Phelips, set up in the windows four panels of fine heraldic glass, and three more, uniform with them in size, were added in the later part of the seventeenth century. Marriages were sometimes performed in the chapel, as in 1608, when William Cavendish, afterwards Earl of Devonshire, married Christiana, daughter of Edward, Lord Bruce of Kinloss, Master of the Rolls, and in 1615, when Sir Julius Caesar, Master of the Rolls, married Mrs. Hungate, who was given away by her uncle, Sir Francis Bacon. The fact that a marriage between John Livingston and Mrs. Marwood took place at the Rolls in February 1619, goes far to discredit the oft-repeated statement that the chapel was being rebuilt at that time. For this statement there is no authority earlier than that of Thomas Pennant, who in his "Account of London," published in 1805, asserts that the Rolls Chapel "was built by Inigo Jones; begun in 1607, and finished at the expence of two thousand pounds," and proceeds to say that "it was consecrated by George Mountaigne, Bishop of London, and the sermon preached by the famous Doctor Donne." Inasmuch as Mountaigne did not become Bishop of London until September 1621, the alleged consecration could not have taken place any earlier, and the chapel would presumably have been unfit for use in February 1619. It is, however, practically certain that Pennant somehow confounded the Rolls Chapel with the neighbouring chapel of Lincoln's Inn, for every one of the five statements quoted above with regard to the former proves to be true with regard to the latter. The rebuilding of Lincoln's Inn Chapel was undertaken in 1617, "the consideration of a fit model" for it was "commended to Mr. Inditho Jones," the estimate came to upwards of 2,000*l.*, the new structure was consecrated by Mountaigne, Bishop of London, on Ascension Day 1623, and the sermon on that occasion was preached by Dr. Donne, Dean of St. Paul's. There is, in fact, no evidence whatever to connect Inigo Jones with the Rolls Chapel, and the episcopal registers of the time do not contain any allusion to the alleged consecration. That the building was to a great extent reconstructed in the seventeenth century is unquestionable, but the date of the work is probably forty or fifty years later than that erroneously assigned to it by Pennant.

The existence of two chaplains and of converts from Judaism, four in number, is mentioned for the last time in 1608, and in the reign of Charles I. we read of a preacher at the Rolls during the law term, admitted by the Master of the Rolls with the approbation of the six Clerks of Chancery. Although the converts, for whose benefit the chapel had been founded by Henry III., had ceased to exist, the Master of the Rolls did not obtain the exclusive use of it. In 1708 it was reported that the preacher received 10*l.* a term from the Master of the Rolls, and that the salary was made up to about 100*l.* a year by the Masters in Chancery. As late as the beginning of the present reign "the Masters, six Clerks, Registrars and other officers" of the Court of Chancery were entitled to seats in the Rolls Chapel on payment of fees amounting to about 49*l.* 2*s.* 8*d.* a year to the preacher, who also received rents for pews let "to persons not entitled to seats."

Under the Presbyterian régime, it was resolved by the lords and commons in Parliament, in December 1643, "that the Chappell of the Rolles, the two Serjeants Innes and the lower

\* From the appendix to the report of Mr. H. C. Maxwell-Lyte, Deputy Keeper of the Public Records.

Innes of Court shall be a Province of themselves," "that the Presbytery of the Chappell of the Rolls, the two Serjeants Innes and the fower Innes of Court shall be divided into two classis," and "that Lincolnes Inne, Grayes Inne and Serjeants Inne and (*sic*) Chancery Lane and the Rolls shall be one classis."

Almost immediately after the Restoration, the Master of the Rolls was empowered by Act of Parliament to grant leases of portions of his official estate; but "the Chappell of the Rolls" was specifically excepted from the scope of it, and there are indications elsewhere that it was regarded as national property.

At some time in the middle of the seventeenth century, the Rolls Chapel was seriously mutilated. No written record has been found showing the date or the nature of the work done, and we have to rely exclusively upon architectural evidence. From this it appears probable that the chancel was entirely demolished and a new wall built at the eastern end of the nave, that the other three walls were considerably altered, that a new roof was made over the nave, that most of the Mediæval windows and doors were blocked up, and that two or three monuments and four or five panels of heraldic glass were taken down and refixed.

Particulars will be given later in this report, but it may be desirable to suggest here that, if all these changes were made at one time, the date must be sought between 1648 and 1667. That it cannot be earlier than the middle of the seventeenth century seems clear from the general character of certain fragments of stone and marble which were used for filling up two of the windows on the south side. With a little trouble it has been found possible to put together several pieces of an oval shield, surrounded by scroll-work and stiff drapery, which bears the following arms:—On a chevron, between three annulets, a crescent, impaling on a saltire a rose; and this proves to be the shield of George Goring, Earl of Norwich, who married Mary, daughter of Edward Nevill, Lord Abergavenny. Inasmuch as both these persons were buried in Westminster Abbey, it is difficult to account for their arms being found at the Rolls Chapel, except upon the theory that the mason employed to fill up the windows supplemented the material which was ready to hand with useless fragments from his own workshop. However this may be, it is certain that the Countess of Norwich died in 1648 and the Earl in 1663, and so the former year appears to be the earliest possible date of the closing of the windows.

That the chancel had disappeared by 1667 is clear from Hollar's map of London, published in that year, which is confirmed by the larger map issued by Ogilby and Morgan ten years later. It may possibly have been injured in the Great Fire of London, and consequently demolished. A letter received at Claydon House on September 9, 1666, contains the following passage:—"Your friends in Chancery Lane are safe, but the fire was near them, behind the Rowles, where it gott a great check, so that we hope it is stopt." Among other premises which were either burned or pulled down at that time, mention is made of several tenements held by John Howe, gentleman, "situate in Fetter Lane, built upon part of the garden called the Rolls Garden;" a messuage held by Benjamin Hill, citizen and clockmaker, "built upon a parcell of ground, parcell of the garden called the Rolls Garden;" "four new houses," on the west side of Fetter Lane, "over against unto a certain stret called New Street," and extending westwards from 106 to 123 feet "to the wall of the said Rolls Garden;" and also the St. John's Head tavern in Chancery Lane, upon the estate of the Bishop of Chichester.

In this connection it may be mentioned that some fragments of wrought stonework not older than the fifteenth century, which were found in the walls of the chapel, show signs of having been exposed to the action of fire. At the same time it is clear from other fragments that the interior cannot have been burned, and Hollar's map, already mentioned, shows trees growing in the Rolls Garden. Furthermore, a date somewhat earlier than 1666 for the removal of the monuments is suggested by the fact that some hexameter lines in praise of Dr. Yong, which are given in Weaver's "Funeral Monuments," which was published in 1631, are not mentioned in the first edition of Dugdale's "Origines Juridicales," which was printed shortly before the Great Fire of London.

Edward Stillingleet, who afterwards became Bishop of Worcester, was preacher at the Rolls in 1664. Eleven years later Gilbert Burnet was appointed to that office, but he was ejected from it under somewhat remarkable circumstances. Having occasion to preach in the chapel on November 5, 1684, on the anniversary of the discovery of the Gunpowder Plot, he took as his text, "Save me from the lion's mouth, thou that hast heard me from the horns of the unicorns." According to his own positive statement he "made no reflection" on "the two supporters of the King's scutcheon," but he showed "how well popery might be compared to the lion's mouth," and mentioned "that wish of King James I. against any of his posterity that should endeavour to bring that religion in among us." A report of the sermon was carried to the Court, and there the text was thought to be "levelled against the king's coat of arms."

Accordingly, at the end of the law term, the Lord Keeper wrote to Sir Harbottle Grimston, Master of the Rolls, saying "that the king considered the Chapel of the Rolls as one of his own chapels," and that, having dismissed Burnet from the Court as a person disaffected to his Government, he would not have him suffer "to serve any longer in that chapel." Burnet adds that his "employment at the Rolls would have fallen in course within a month if the Court had delayed" his ejection "from it in such an open manner, for that worthy man, Sir Harbottle Grimston, died about Christmas." This explanation is interesting as showing that the position of preacher at the Rolls was not regarded as a benefice, and that it naturally determined upon the occurrence of a vacancy in the office of the Master of the Rolls.

In a "New View of London" by E. Hatton, published in 1708, we read:—"The chapel is an ancient structure built of brick, boulder and some freestone (the doors and windows are of the Gothic order), roof covered with slate. The ornament of the presses for Rolls on the inside is columns and pilasters of the Ionic and Composite orders. It is in length 60 feet, breadth 33." The writer proceeds to mention the monuments and adds that "at the N.W. angle of this chapel is a bench, &c. where the Master of the Rolls hears causes in Chancery out of term time."

John Strype, in his edition of Stow's "Survey of London," mentions "the old and decayed house" of the Rolls as "much wanting new building," and expresses an opinion that "the chapel also would admit of new building." This was published in 1720, but it must have been written some years earlier, for in 1717 Colin Campbell, the architect, was appointed "to pull down the House of Converted Jews in Chancery Lane and build a new edifice for the use of the Master of the Rolls, and likewise to repair and improve the Chappell of the Rolls and other appurtenances of the said house." The whole cost of building the Rolls House between the years 1717 and 1724 inclusive was defrayed out of the exchequer, but although minute accounts have been preserved of the expenditure on labour and materials, they do not afford any information as to the exact nature of the alterations then made in the chapel. Architectural evidence, however, shows that Colin Campbell must have been instructed to connect the Rolls House with the chapel, so that the Master of the Rolls and his family might be able to attend divine service without going out of doors. This he did by erecting between them a small lobby over a narrow vaulted passage sloping down eastwards from Rolls Yard to the basement of the new mansion, and by cutting a large arched opening through the north wall of the chapel. The latter operation involved the destruction of the lower part of the only remaining lancet window of the thirteenth century, and the closing of the upper part. Inasmuch as the floor of the lobby was several feet above the pavement of the chapel, there were no means of communication from the one to the other; but a raised pew was provided for the Master of the Rolls, which formed a sort of gallery projecting from the north wall of the chapel, and accessible only through the lobby. It was probably at this date that a Gothic doorway on the north side of the chapel was demolished, and a new entrance substituted for it at the west end of the building, almost opposite to the gateway from Chancery Lane into Rolls Yard.

An engraving by B. Cole in the 1756 edition of Maitland's "History of London" shows that at that date there was only one window in the south wall of the Rolls Chapel, the two eastern ones having been blocked up as mentioned above. The turret still had a low four-sided spire, and there were two buttresses dividing the south wall into three bays. These buttresses, however, were removed, and the turret was altogether hidden from view, when, pursuant to an address of the House of Commons in 1784, a building was erected immediately south of the chapel, for the use of the clerk of the records in the Rolls Chapel, and of the secretaries of the Master of the Rolls. Then, or very soon afterwards, a thin external layer of flints was placed over all those rubble walls which were not protected from the weather by adjoining buildings.

The result of successive repairs and alterations at the Rolls Chapel was that seven years ago there was not a particle of Mediæval work visible within or without. The inner roof was of lath and plaster, put up about forty years ago, and the inner walls were lined throughout with plaster. The external walls were covered with a thin layer of flint, except in places where there were patches of comparatively modern brick, stone and stucco. The buttresses had been removed or mutilated, and the four large windows were devoid of tracery. Altogether it was a mean and ugly building, entirely without architectural merit, and interesting mainly on account of its monuments and its panels of stained-glass. Even these could not be properly seen, the former being in the eastern part of the chapel, which was very dark on the brightest day in summer, and the best glass being high up in the western window.

In 1889, the house known as 1 Rolls Yard, which adjoined the south side of the chapel, was demolished, and the removal of it disclosed some features of which the existence was not

previously known. Further operations were carried on in 1895 with a view to finding Mediæval remains and ascertaining what portions, if any, of the structure could be retained. The Act of 1837 clearly contemplated a possible demolition of the chapel, and in the plans for the Public Record Office made by Sir James Pennethorne in 1850, the whole site of the chapel had been allocated to rooms intended to serve as repositories of documents. On further consideration, however, it was thought that it might be possible to incorporate the chapel in the new block of the Public Record Office, removing only the roof, which, being made of wood, could not be permitted to form part of a building which had to be fireproof. A design was accordingly prepared for erecting massive piers on the south side of it, which would have allowed the old walls to show between them. There are at least two precedents for such a course, one at Southampton, where a Norman house was incorporated in the town walls of the fourteenth century, the other at Rimini, where the walls and windows of a Mediæval church show under the Renaissance arches erected by Alberti for Sigismondo Malatesta. This scheme was, however, abandoned when it was found that the old walls were thoroughly rotten, stonework and mortar having alike decayed with age. The rubble walls were, in fact, rent with long fissures, and there was no architectural work that could be "restored" without being altogether remade, mostly from entirely new designs. Under these circumstances, the First Commissioner of Works decided, with great reluctance, that the chapel should be pulled down. Special treatment will, however, be given to that portion of the new building which will occupy its site, and the old monuments and stained-glass will be refixed therein.

### GOTHIC ARCHITECTURE.

ON Saturday evening Professor Baldwin Brown, Edinburgh, lectured to a large audience in the Academy, Moffat. Dealing with Gothic architecture as illustrated in some of the great Mediæval buildings, the Professor showed how the arch, the soul of the fabric, reached its logical conclusion in French Gothic churches of the twelfth and thirteenth centuries, and how the round arch of the Romans was superseded by the pointed arch. In the first vaults massive walls were used to resist the lateral pressure. In the vault so formed it was found that the pressure was concentrated on the four corners. Having examined this, the French opposed the outward pressure by opposing pressure. Buttresses became essential elements of construction, and were weighted by pinnacles. The heavy intervening wall became a mere screen, and afterwards was filled with glass, and thus were obtained the traceried windows. The French style was Flamboyant and the English Perpendicular. In French Gothic cathedrals there was the advantage of additional height, from its scientific construction and western façade. English cathedrals possessed the charm of perfection and situation.

### CORNHILL.

CORNHILL was so called from its having been anciently the great city market for corn, the principal factors or dealers in which article had their stalls or standings on market days in the middle of the street. Its inhabitants at this time were chiefly drapers, who were so numerous that they formed themselves into a fraternity or guild under the name of the "drapers of Cornhill," which was extant in 1361. The drapers gave way to a lower order of tradesmen about the reign of Henry VI. called "fripperers or upholders" (i.e. dealers in second-hand apparel and household stuff), of whom an old writer says, "I have read of a countryman that, having lost his hood in Westminster Hall, found the same in Cornhill hanged out to be sold, which he challenged, but was forced to buy or go without it; for their stall they said was their market. About this time also the wine drawer of the Pope's Head Tavern (standing without the door in the high street) took the same man by the sleeve and said, 'Sir, will you drink a pint of wine?' whereunto he answered, 'A penny spend I may; and so drank his pint; for bread nothing did he pay, for that was then allowed free.' It recovered its respectability before the reign of Elizabeth, and has ever since boasted of the residence of the first and most opulent citizens.

The chief objects of an architectural nature by which Cornhill was distinguished in these early times (independently of its houses, several of which were curious), were the great conduit called the Tun; the Carrefoure and the original Bourse, or Royal Exchange.

The Carrefoure was a water-standard, which stood at the parting of the four ways formed by Gracechurch Street, Bishopsgate and Leadenhall Streets and Cornhill. It was invented in 1582 by Peter Morris, a German, and was supplied by means of an artificial forcier with Thames water, which ran every tide

through four spouts pointing towards the four streets. Being found an inconvenience from its frequently overflowing, it was several times presented by the ward inquest as a nuisance, and was at length totally removed. It is generally called in these presentments the Carrefoure, and sometimes the "Four spouts;" and appears, from old representations of it, to have been, when standing, a great ornament to the neighbourhood.

The Tun was originally a sort of cage or prison, and was situated about the middle of the street, being so called from resembling in shape "a tunne standing on the one end." It was built of stone by Henry Walleis, mayor, about 1282, for the confinement of night-walkers and other disorderly characters; but in 1401 was converted into "a faire conduit of sweet water, castellated," which was conveyed in pipes from Tyburn, and was thenceforth named the Conduit in Cornhill. The well or spring on the spot was on this occasion planked over, and a cage, stocks and pillory placed on its site, but these were subsequently removed more westwards and a pump erected in their stead. This was the same spring which supplied the pump in front of the Royal Exchange. The Tun was an object of which frequent mention is made by our early topographical writers and annalists.

The Bourse, or original Exchange, was erected in 1566, on the sites of certain courts or alleys, and their houses, described to have contained in all fourscore households, which were purchased by the City for 4,000*l.* and upwards, and sold to such persons as should take them down and clear the ground for about 47*l.* It was finished in a twelvemonth from its commencement, and in 1570 was visited by Queen Elizabeth with great pomp and named the Royal Exchange. This structure, which was only of brick and timber, stuccoed in parts to resemble stone, was burnt in 1666. It was not unlike the late Exchange withinside, but differed considerably without, particularly in the tower and front, the latter being removed farther north from the street than at present, and in part blocked up by houses; the tower also (which was of brick) was but mean. The Exchange, as just observed, was in great part hid by houses, which gave the spot an appearance quite different to what we now see it. The nature and situation of these houses are elucidated by the following passages from Stowe:

"Next adjoining to the Royall Exchange remaineth one part of a large stone house, now called the Castle, of such a signe at a taverne doore; there is a passage thorow, oute of Cornhill, into Threadneedle Street; the other part of the said stone house was taken downe for enlarging the Royall Exchange. This stone house was said of some to have bin a church, whereof it had no proportion; of others a jew's house, as though none but jews had dwelt in stone houses." He adds, "On the north side of Cornhill, from the east unto the west, have ye faire houses for merchants and others, amongst the which, one large house is called the wey-house (weigh-house), where merchandizes brought from beyond seas are to be weighed at the king's beame." Sir Thomas Lovell, knight, builded this house with a faire front of tenements towards the street; all which he gave to the Grocers' Company, of which he was himself a member."

Besides the above, which stood on the north side of the street, there was on the opposite side the celebrated Pope's Head Tavern before mentioned, which was a building of considerable antiquity and magnitude. This and other adjoining houses, all strongly built of stone, and originally forming one structure, was, from its large size, and having the royal arms in front, thought by Stowe to have been once a residence of the English sovereigns. Pope's Head Alley still commemorates the name of this tavern, and occupies its site.

### GLASGOW ARCHITECTURAL ASSOCIATION.

A MEETING of the Glasgow Architectural Association was held in the rooms, 187 Pitt Street, on Tuesday, the 5th inst., Mr. Wm. Tait Conner in the chair, when Mr. W. J. Blaine read a paper entitled "Some Scotch Houses." The lecturer limited himself to the consideration of four of the finest and most characteristic examples of Scottish castellated architecture—Crathes, Craigievar, Midmar and Castle Fraser, all situated within a short circular tour from Aberdeen.

Mr. Blaine took into consideration only the original castles or keeps, which in date lap from the latter half of the sixteenth century into the first half of the seventeenth century, leaving out the later wings, and after describing the natural surroundings gave an account of their individual history; then entering into a critical analysis of the principles of design they illustrate. Comparing the one with the other, he pointed out their strong and weak points, making this clear by diagram sketches and photos, the former of which he referred to as also exemplifying a theory of his that the size of a building appears on a drawing in inverse ratio to its size in reality. In summing up the lecturer placed these four buildings and their characteristics in the following order of merit:—Crathes—dignity, with beauty of detail; Castle Fraser—beauty of detail, with dignity; Midmar—dignity, without beauty of detail; Craigievar—beauty of detail, without dignity. After a short discussion, the lecturer was awarded a hearty vote of thanks.

## NOTES AND COMMENTS.

ALTHOUGH the French architects possess several architectural societies, they appear to be more and more tyrannised over by the authorities. It is recognised that the societies are a drag upon the individual members, who, when they join, lose their liberty of action, and dare not remonstrate through fear of offending against some corporate prejudice or other. The latest example of harsh and inequitable treatment is one affecting architects who have undertaken the important responsibility attached to the care of the cathedrals. There are sixty architects attached to the service, who are directed by three chief inspectors, MM. DE BAUDOT, CORROYER and VAUDREMER. The architects are compelled to be always on the alert, in order that any appearance of decay can be dealt with without loss of time. The French system may be said to mean restoration on a retail or petty scale, while in England the wish is to carry out works in a sort of wholesale way. The cost of reparation falls on the French Government, and it is risky for an architect to propose any scheme which would be expensive. The constant watchfulness could not be exercised unless the architects often visited their charges, and, as it is not always possible to have an office contiguous to a cathedral, it is necessary to lay out money on travelling expenses. The amounts will vary according to the distance traversed. Now the vote on account of the cathedrals which is about to be submitted to the Chambers is lower in amount than last year's, because the Government have declined to recognise any claim for travelling expenses. The total sum which will be saved is no more than 1,200*l.*, but it is too large to be drawn from the purses of architects who are not paid in proportion to the value of their services. Moreover, the rejection of the claim is a stigma on the profession, for it will be generally concluded that the diocesan architects have been drawing money from the public funds after the manner of corrupt officials. In a provincial town a suspicion of that kind does not help to increase commissions; yet the societies to which the architects belong appear to be afraid to utter the meekest protest. Some may imagine the architects have the remedy in their own hands, and if they less often visit the cathedrals the expenses for repairs must be increased. But the Government would promptly deal with a case where neglect was suspected, and moreover, it is well known that any one of the architects would submit to greater sacrifices rather than allow his cathedral to be neglected.

It was anticipated that the exploration of the Dumbowie hill fort would enable some important archæological problems to be solved. But it can hardly be said that result is attained. The collections in Edinburgh are enriched by several prehistoric objects, which are evidence of the residence of people in the neighbourhood who fought, hunted, fished and cooked, who could make various implements, and occasionally attempted a simple sort of ornamentation; but the people at Dumbowie were not more civilised than their contemporaries. The fort was built with walling without mortar, and must have been sufficiently strong to resist an attack; but by agreement with the owner it has been restored as near as possible to its former condition, and in a short time it will appear as if the turf was never disturbed to allow of exploration. It is rarely any novelty to repay the trouble is to be discovered in the chambers of one of these early defences, but the more failures the stronger becomes the desire to take part in similar operations elsewhere.

THERE are many botanists who believe the papyrus has disappeared from the rivers and marshes of Egypt. It has been said the plant grows near Lake Menzaleh, but investigation demonstrated it was not the true *Papyrus antiquorum* or the *Cyperus papyrus* of LINNÆUS. The prophet's words, "the paper-reeds by the brooks, by the mouth of the brooks, and everything sown by the brooks shall wither, be driven away and be no more," have been fulfilled. That something similar can be made to grow for a while, not only in Egypt but in London, was shown by the secretary of the Royal Botanic Society at the meeting on Saturday. Mr. SOWERBY exhibited stems of the plant

which grows in a tank in the gardens where the Victoria lily flourishes. This year the so-called papyrus has formed a clump 7 feet in diameter, with stems 14 feet long and 2½ inches at the base. From the white pith of which the stems are composed a sort of paper was prepared by slicing the pith up into flat strips and laying them side by side until a sufficient length was obtained. Under pressure the pieces adhered together, forming a perfectly smooth even sheet, which could be written upon and rolled up without further preparation. Mr. SOWERBY says that paper made in this way from plants grown in the gardens, when compared with a fragment taken from an Egyptian tomb, and, according to Dr. BIRCH, at least 3,000 years old, was found to possess similar quality. The only difference between the two was the darker colour of the older specimen.

THE Ecole des Beaux-Arts from time to time receives bequests for prizes, but this month an offering of another kind has been presented. A lady, whose name remains unannounced, has made over to the school three appartements in a villa at Neuilly, near the Pont de Courbevoie. The position is one of the most agreeable in the suburbs of Paris, and the occupants of the villa can study the valley of the Seine under one of its most picturesque aspects. The arrangement is that three of the most deserving students of the school who are not overburdened with cash are to be accommodated in the villa. The rooms are suitably furnished, servants are also provided, and arrangements can be made for meals at a fixed tariff. There is some ingenuity in the gift, and the first tenants selected who are in residence are to be congratulated, although they may be deprived of some of the gratifications which are afforded in Paris "dans un grenier qu'on est bien à vingt ans."

THE great work of M. BARTHOLOMÉ, the French sculptor, called *Monument aux Morts*, and which is monumental in another sense, will be completed in a manner which he did not contemplate when he exhibited the model in the Champ-de-Mars a few years ago. When the site was selected in the cemetery Père-Lachaise, the sculptor realised for the first time that the addition of two wings to the main body of the work would enhance the effect. The Municipal Council agreed to the alteration, although not many months ago M. BARTHOLOMÉ was forced to abandon it, owing to the obstructions of the Council and the cheeseparing policy which inspired the arrangements with him. The change is in a great measure owing to the tact shown by M. FORMIGÉ, the architect, who fortunately has charge of the arrangements for erecting the monument. The façade will measure about 50 feet by 20 feet. In the course of the summer a large part of the masonry and a part of the sculpture will, it is hoped, be erected, and M. BARTHOLOMÉ will then be able to attach the remaining parts on the spot, and can do justice to a work which will have occupied him for twelve years.

EXHIBITION buildings after the season is over are generally found to be useless. Those in the Champ-de-Mars might be supposed to be destined to have that fate. But the Municipality of Paris contrive to extract a large sum annually from them. Last year, for example, the former Palais des Beaux-Arts returned an income of 61,060 francs, the Palais des Arts Libéraux paid 80,750 francs, and the immense hall which was built for the display of machinery 80,000 francs. From the parks and gardens a sum of 45,360 francs was derived. The old buildings on the Champ-de-Mars accordingly form another illustration of French skill in drawing large profits from waste products.

## LINCOLN CATHEDRAL.—III.

A WRITER describing the effect produced by the interior of Lincoln Cathedral says:

The great and perhaps the only defect is a want of height; the vaulting is not sufficiently elevated for the length and breadth of the cathedral. The beholder at once exclaims "This is too low." The eye cannot be satisfied with less than five-and-twenty feet more of elevation. It is almost impossible for a church in the Pointed style to be

too lofty, but it may easily be too low; this style requires a greater proportion of height to length and breadth than any other style of architecture. Beauvais Cathedral is said to be higher than need be, but no one has ventured to call it a defect; on the contrary, everyone allows it to be sublime. The vaulting of the nave of Lincoln Cathedral is somewhat higher than that of the choir and presbytery, the height of both which is again lessened by the pavement being raised above the pavement of the nave. In the length of

Photographed by S. B. Bolas & Co.

LINCOLN CATHEDRAL, GABLES, PINNACLES, &C.

the nave are seven pointed arches on each side, supported on eight clustered columns, six of which are isolated, and two—one at each extremity—engaged. The two first arches westward are narrower than the others, and more acutely pointed. The open arches, above these last named, are divided down the middle into two; those over all the others into three. The windows of the clerestory are all alike,

aisles—which are of one light each, and two within each compartment—the wall is adorned with a line of trefoiled-headed arches upon short clustered columns. Having walked along the nave to the eastern extremity of it, we are brought into the greater transept, and under the central tower. The four clustered columns which support it are regular and well-proportioned; they are composed of

LINCOLN CATHEDRAL, ARCADE.

Photographed by S. B. Bolas & Co.

viz. three in each division, side by side, of one light each, the middle one rising higher than the outer ones; except, indeed, that those over the two narrower arches of the nave are of course narrower, being inserted in a less space. The vaulting of the two first, or western compartments of the nave, is much more simple than that of all the rest, and of the nave itself. All along under the windows of the side

twenty-four attached columns of various diameters, of which twelve are of stone and twelve of Purbeck marble; they rise to the height of 48 feet, and the massive arches they sustain are made to assume an air of lightness by the number and delicacy of their mouldings, and the decoration of the spandrels with trellis-work. Above these arches are two tiers in each side of the tower, with columns and

arches deeply receding; behind which, on the upper tier, are windows of one light each; at this height the further view of the interior of the tower is prevented by a vaulting of stone, with elaborate tracery, erected in the time of the treasurer WELBOURNE. The west side of the greater transept is very similar to the nave, the north and south ends of it have each a circular window of the same dimensions, though of different designs; they are each 24 feet in diameter, and, together with the windows below them, are both filled with ancient stained-glass, which gives to the interior of this transept that rich, glowing, but subdued light, the want of which is felt so keenly in every other part of the cathedral. The east side of the transept is very similar to the choir, except in the clustered columns of the principal arcade, which are each composed of sixteen shafts, chiefly of Purbeck marble. The aisle in both wings was anciently appropriated to chantries, but no vestiges of altars now remain. They are divided from each other by projecting piers of very elegant design, and from the body of the transept by screens of excellent Perpendicular character, which add greatly to its beauty.

We will now enter the choir, which it must be confessed is more curious as an important link in the history of the Pointed style than commendable for architectural merit, especially if compared with the choirs of many other cathedrals, and particularly of York, with which this cathedral is continually brought into comparison, and yet, from the great beauty of the presbytery, two compartments of which form the chancel end of the choir, the richness of the prebendal stalls and other accessories, it is by no means deficient in appropriate effect. There are sixty-two stalls for the Dean and prebendaries, with elaborate canopies, and containing misereres or half-seats, ornamented with foliage and various grave and ludicrous devices. The seats of the vicars and some others are fronted by arches, containing excellent carvings of kings, and angels playing on musical instruments; the whole of these are of oak, and appear to have been executed late in the fourteenth century. The bishop's throne is placed at the end of the south side, and, though modern, agrees very well with the stalls, a merit which the pews are entirely without. The organ also over the west end of the choir is very bad, and the front of it has displaced some rich tabernacle work, which adorned the ancient jubé, as the gallery above the screen used to be called.

The whole of the east transept corresponds in style with the choir, excepting the upper part of the south end, which appears to have been rebuilt about the middle of the thirteenth century.

We come now to the presbytery, which comprises the whole east end of the church, beyond the upper transept, and here the statues in the spandrels of the arches of the first triforium should be particularly noticed; of these there are thirty, ten of which—the centre and principal one of each bay—are of still higher merit than the rest. The greater number are represented as employed in singing or playing on musical instruments, consisting of the harp, zebec, citern, trumpet, tabor and pipe, double pipe and bagpipe, which last is designed with great taste, the upper part of the instrument being in form of a bird which rests on the left hand of the performer, while the beak appears to supply the reed on which he plays.

The great east window is filled with modern stained-glass, put up in 1762; it is poor and feeble, and the effect not good. The space beneath this window, where anciently stood the altar of JOHN THE BAPTIST, was appropriated to the chantry of Queen ELEANOR, originally founded at Heneley, where she died, and was transferred to this place by EDWARD II. in 1310. It contained an altar-tomb of marble, on which was placed her effigy in gilded brass.

**Messrs. Chessum's** claim for compensation in respect of the construction of the new offices of the Commissioners of Sewers, has been settled by arbitration at 2,738*l.*, while 3*l.* 16*s.* 2*d.* per day has been fixed on as the sum due to the builders until the buildings are resumed or the contract ended. The original claim was 7,000*l.* The work was suspended by a chancery injunction obtained by neighbouring owners on account of interference with ancient lights.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fifth general meeting for the present session of the Institute of Architects was held on Monday last, Professor Aitchison, A.R.A., president, in the chair.

The minutes of the last meeting were read and agreed to.

Mr. Alfred Baskett Pinckney, M.A., of Worcester, was elected a Fellow, and the following Associates were also elected:—Messrs. H. J. Gee Smith, Philip Appleby Robson and Hubert W. Walker.

The deed of award of the prizes and studentships for 1896-97 made by the Council was read by the President.

### Prizes and Studentships.

Although five essays on the subject of "The True Value of Tradition and Precedent in Architectural Design" were sent in, there was not one which was considered of sufficient literary merit to be adjudged the Institute silver medal and 25 guineas, but 15 guineas have been granted to Mr. John J. Cresswell (of Grimsby), who competed under the motto "Things New and Old."

The Institute silver medal and 10 guineas were awarded for measured drawings of an ancient building to Mr. F. J. Wass.

The subject assigned for the Soane medallion and 100*l.* was a "Design for a Provincial Market Hall." It was secured by Mr. J. A. R. Inglis. A medal of merit was obtained by Mr. J. A. Swan. Mr. C. H. Holden was allowed honourable mention. Sixteen designs were submitted.

The Pugin studentship, a silver medal and 40*l.* (for travel in the United Kingdom), was given to the drawings sent in by Mr. William Haywood. A medal of merit was given to Mr. C. de Gruchy, and to Mr. Walter E. Dobson honourable mention. There were eight competitors.

The Godwin bursary, a silver medal and 40*l.*, founded for the promotion of the study of works of modern architecture abroad, was carried off by Mr. R. Stephen Ayling. There were only two competitors.

The Owen Jones studentship, a certificate and 50*l.*, was awarded to Mr. A. E. Henderson, who submitted five strainers of work in Florence, St. Mark's, Venice, and sculptured capitals illustrating Greek Byzantine, Byzantine, Saracenic Byzantine and Early Italian Gothic. Two students competed.

The Tite prize, certificate and 30*l.*, was not awarded. The subject was an Italian villa and ornamental garden.

The Grissell gold medal and 10 guineas (for design and construction) fell to Mr. S. K. Greenslade. Seven sets of drawings were sent in.

The Aldwinckle studentship, a certificate and sum of 50*l.*, has been awarded to Mr. Arthur J. Griffith.

It was announced that the next meeting would be held on Monday, January 18, when an address to students will be read by the President and the prizes presented. There will also be some critical observations on the students' work, read by Mr. W. Milner Fawcett, M.A., vice-president. On the same occasion Mr. Alfred Waterhouse, R.A., as chairman of the board of examiners, will present a testimonial to Mr. Arthur Cates, in recognition of his long and valued services as chairman of the board.

## SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE usual monthly meeting of this Society was held in their library at the museum, Queen Street, on Monday evening, Mr. J. Balfour Paul, Lyon King of Arms, vice-president, in the chair. In the first paper Mr. Robert Brydale described a group of seven carved grave-slabs in the churchyard at Dalmally, which was anciently called Clachan Disert, and is stated in Dean Macgregor's "Chronicle" to have been the burying-place of the chiefs of Macgregor from 1390 to 1528. The "Chronicle" records the burial of no fewer than twelve of these chiefs successively, "in stone coffins," at the north side of the east end of the church. When the old church was demolished, about 1811, a number of stone coffins and carved grave-slabs were found in this position. Some of these slabs were appropriated by such of the clan as still continued to bury there. From the notices given of these stones by Pennant in 1769 it appears that one at least was attributed to a Macgregor, and Dean Howson in 1842 speaks of one which was then among the tombs of the MacIntyres and another among those of the Macnaughtons. He also mentions two which seemed to belong to ecclesiastics, but are not now to be recognised. Of the seven stones now described three are of the same type, showing in a panel the figure of an armed man with sword and spear, and wearing a pointed bascinet and short tunic, the rest of the surface being filled in with foliaceous ornamentation. A fourth is curious as showing this type superimposed on a larger figure obliterated, and having a cross at the top of the stone. Of the other two of this type one is curious from its small size, and the other is much mutilated. The seventh is apparently the front slab of an altar tomb, and bears a finely carved scroll of foliage, but no armed figure. Drawings of all the slabs were exhibited.

In the second paper Mr. Thomas Wallace, F.S.A.Scot., gave some notes of antiquities in the districts of Loch Alsh and Kintail, first describing Castle Grugach, a round dry-built tower or broch, like those of Glenelg, which stands at the foot of a precipitous rock called Onag, on the south shore of the extreme east end of Loch Alsh. It was cleared out in 1889, but all that was found in it was a fragment of a quern. In structure it resembles others of its class, but the stones are large and well fitted together, and there is a huge triangular stone forming the upper lintel of the doorway. There is a vitrified fort of small size between the Glennan Burn and Loch Long to the north of Bundaloch. The island on which Castle Donan stands at Dornie has been fortified by a vitrified wall on the land side. In Glen Elchaig there is one large boulder at Fadoch and another on the opposite side of the river covered with cup-marks. At Dornie there is one with seven or eight cups, at Carr one covered with cups, on a point of rock at Totay Ferry some very large and deep cups, and near the manse of Kintail a group of boulders bearing numerous cups. About a mile from Shiel Inn there is an underground structure which has been described as an earth-house, but the entrance is now closed. The rest of the paper was occupied with the old military roads of the district and their inscribed stones, of which photographs were shown.

In the third paper Mr. F. R. Coles gave a notice of the standing stones of Törhonskie, Wigtonshire, which seem to be the megaliths of a great cairn, although the accumulation of stones about them is really known to be recent, and the group of standing stones appears analogous to those at Glenquicken, Park of Tongland and hills in the Stewartry. Tradition associates it with the grave of the fabulous King Galdus, the earliest record of this association being found in the Sibbald manuscripts.

In the fourth paper Mr. R. Crawford Walker, F.S.A.Scot., gave a notice of an interesting heraldic monument at Kilmany, Fifeshire, which is probably unique in Scotland. The monument is a flat stone in the churchyard, on the top of which is inserted a copper plate, about 3 feet long by 18 inches broad, bearing an inscription in memory of John Melville, of Cairnie or Murdocairnie, a property in the parish of Kilmany, which now belongs to Mr. Gillespie, of Mountquharrie. At the foot of the plate are the arms of John Melville, impaled with those of his wife, Mary Maitland, with the addition on the dexter and sinister sides of four probative quarters for the paternal and four for the maternal descents.

#### LIVERPOOL ARCHITECTURAL SOCIETY.

THE fourth ordinary meeting of the 49th session of this Society was held at the Law Library, Union Court on the 11th inst., when a paper was read by Mr. C. E. Mumford on "Belgian Churches," illustrated by limelight views. Mr. George Bradbury, president of the Society, presided. Mr. Mumford, in his opening remarks, said Belgium was without doubt one of the countries of Europe where the fine arts had flourished and were still flourishing with the utmost vigour. The long series of great painters who succeeded each other for more than four centuries had not alone brought her the renown which she so justly enjoyed. Architects and sculptors had contributed their part. The devotion and intellectual culture of the Flemings had been shown in the vast number of churches of high architectural merit which were to be found in the country. Few of the older buildings now in existence dated back beyond the beginning of the thirteenth century. It was not until the Gothic style was firmly rooted in the adjacent countries that it came to be adopted by the Flemings. All the vast wealth of ornament accumulated in these churches up to the middle of the sixteenth century was destroyed by the Calvinist iconoclasts, and then there perished a wealth of art the loss of which was irreparable. About the commencement of the seventeenth century, the country again becoming prosperous, art and architecture received a new impetus, and many new churches were erected. The builders of Belgian churches, whilst striving successfully after the beautiful, always kept the practical utility of their work well in view. About 150 slides, photographed by the lecturer, illustrating churches in the towns of Antwerp, Lierre, Malines, Brussels, Namur and Dinant were shown on the screen. The proceedings closed with votes of thanks to the lecturer and the chairman.

#### THE VIEW FROM RICHMOND HILL.

A MEETING of the Richmond Town Council was held on Tuesday to consider a memorial in protest against any attempt to destroy, or at any rate damage the view from the terrace at Richmond Hill. The memorial was as follows:—"To the Mayor and Town Council of the Borough of Richmond,—We, the undersigned, respectfully protest against any interference with the rural character of Richmond Hill, which we consider would be seriously injured by any removal of the

holly and thorn-bush hedge on the terrace, or by placing any prominent iron fencing in lieu or in front thereof; and we trust that your Council will not sanction any such alteration, but will limit any works to the proper maintenance and repair of the hedge." The memorial was signed by Sir Edward Poynter, P.R.A., Sir James Linton, Alma-Tadema, R.A., J. Calcott Horsley, R.A., J. B. Burgess, R.A., Briton Riviere, R.A., Frederick Goodall, R.A., Thomas Ford, R.A., Ernest Crofts, R.A., John MacWhirter, R.A., Ernest Waterlow, A.R.A., W. Q. Orchardson, A.R.A., Eyre Crowe, A.R.A., Solomon J. Solomon, A.R.A., David Murray, A.R.A., Val Prinsep, R.A., and a very large number of artists, local residents, and gentlemen interested in landscape gardening. It was alleged that the hedge is a good growth and only needed the application of the necessary restoratives in the way of culture and clipping to preserve it from the objectionable "hairpins," which have already been erected at one end of the terrace as a specimen of the complete proposal. An amendment against the suggestion of the general purposes committee (to erect a fence 2 feet 9 inches high), to the effect that the hedge should be repaired throughout the old length of the terrace by planting quick and holly plants, and that no fence should be used higher than the existing hurdles, was proposed and seconded. After an assurance was given that the Council had no intention to erect a "hairpin" fence of an unsightly nature, it was resolved that the best should be made under the existing circumstances of the hedge, so as to preserve as far as possible the rural view from the terrace.

#### THE JUDENSTADT, PRAGUE.

THE resolve of the authorities of Prague to remove the unhealthiest parts of the city will be fatal to the Judenstadt, or Jews' town. Every visitor to the Bohemian capital will remember that strange quarter, which was more of a memorial of ancient prejudices against the Hebrew race than similar regions in other cities. Formerly the Jews, however wealthy, learned and skilful, were compelled to reside there, and dare not be seen outside the quarter after 8 P.M. But during the greater part of the present century that restriction has been abolished. The narrow streets are, however, the most crowded part of the Altstadt. From its proximity to the Moldau the quarter is subject to periodical floods, and its removal was long ago dictated by the necessity to keep down the death-rate in Prague and elsewhere. But many associations will vanish with the old houses. The Judenstadt is supposed to be the oldest settlement of the race in Europe, for it is believed the Jews were buying and selling and suffering there before the Christian era commenced. Whatever truth may be in the supposition, there are two treasures which date from a remote age, and which still appeal to Jews in many parts of the world. One is the synagogue, the other is the burial-ground. Both have been often described, but we doubt if any more suggestive account of them has appeared than one by the late Sir Gilbert Scott, R.A., which may not be familiar to some of our readers. It has acquired a new interest, and runs as follows:—

I had walked out for air on a sultry Sunday evening, and having heard that there was there a synagogue of the thirteenth century, it occurred to me to seek for it. Having wandered for some time through the narrow but picturesque alleys of the Jews' quarter, where one sees Hebrew signboards on nearly every house, and Hebrews of all grades about the streets and at the doors and windows, and having been once misdirected to a more recent, though still Mediæval synagogue, I at last found the gloomy edifice; a building of double, high-gabled roof, but externally with no architectural features beyond the narrow lancet-lights in the sides and circular windows of simple tracery in the gables. It was open and service going on. Having never seen a Jewish service, much less in such a place and in so interesting a building, I entered, not without trepidation, through a rather rich Gothic doorway, whose tympanum is decorated with the flowing vine, the badge of the house of Aaron, and one of whose jambs bears a stone alms-box, with Hebrew inscription nearly of the original date. Within, all was dismal and gloomy, though far from being devoid of beauty. The vaulted ceiling is sustained by two lofty octagonal pillars, of good proportion and design, and by alternate shafts and corbels in the walls; but walls, pillars and vaulting are all enveloped by a thick encrustation of black, probably from the smoke of candles, while the narrow windows, high up in the arches of the groining, shed in the dusk evening but a feeble and indistinct light. The centre of the building, including the two pillars, is enclosed as a kind of choir by a breast-wall of stone, bearing a brass screen, terminated, I think, by candles, and by the often-repeated badge (as they tell you) of the house of David, the double intersecting triangle so frequent in Christian churches. Within is a sort of stone altar, on which they say that the books of the law are laid; while in the centre of the eastern end are stone steps (flanked by dwarf walls and high obelisks, bearing candles, &c.), leading to a curious Gothic

tabernacle (now nearly hidden by later work), where these ancient Hebrew rolls are deposited, and in whose rich gable may be seen again the vine of the house of Aaron. Around the walls on all sides are ranges of stalls for the worshippers. I did not, however, distinguish all these details on my first visit, my thoughts being otherwise arrested. I shall never forget the unearthly appearance of the place; its strange arrangement, its gloom, amounting almost to horror, but above all, the uncouth appearance of the worshippers, sitting in their hats, muttering over their Hebrew prayers, while their bodies rocked backwards and forwards as if in agony, and every now and then their mutter, by general consent, raising itself into an inhuman scream. I felt as if among Eastern dervishes, or followers of some dismal mysticism, with which the outlines of our Christian architecture only the more strangely contrasted; but when the thought came over me that these were the very children and people of Abraham, those to whose forefathers the law had been given from Sinai, through whom came all the promises, and from whose race alone we know the existence of the true God, I felt so overwhelmed by the contrast presented by their now degraded and ruined state that I could stay no longer, but made a precipitate retreat. At the door I was stopped by an old Jew, who inquired if I would like to see their ancient burial-ground. This being more congenial with my feelings than to emerge at once into the land of the living, I was glad to take the opportunity of seeing the place—and a most marvellous sight it was. A narrow slip of land between the backs of ancient streets, bending and zigzagging in and out for, perhaps, a quarter of a mile among the gloomy houses, till it terminates on the silent banks of the Moldau. It dates back (they say) nearly a thousand years, and here, till the thirteenth century, they met in a subterranean synagogue. The burials have been discontinued for many years, yet the whole space is piled up with grave upon grave till mounded all over like the site of a Mediaeval stone quarry; every mound and every hollow is covered and filled with gravestones of antique appearance, bearing Hebrew inscriptions and each marked with the badge of the tribe or family of the deceased, the "stems" of David, of Aaron, of Levi and of Israel (probably meaning Judah) being the most prominent. From among these crowded and moss-grown stones protrude (like the stunted oaks of Dartmoor) the dwarfed and cankered trunks of a forest of ancient elder-trees, whose matted branches seem to sympathise with the low estate of those whose bones they overshadow, and bend down upon them so closely that one has almost to creep to make one's way among the tombs. It is difficult to say whether in the synagogue or in the graveyard are to be found more literally "the dry bones of the house of Israel;" but, sad as are the ruins of an ancient temple of God, there can be no doubt that the ruins of His ancient people present a yet more melancholy object to the contemplation.

It was nearly dark when I left this most unearthly of earthly resting-places, and returned towards the dwellings of Christians, deeply impressed with the thought of those through whom we inherit the promises having been themselves cut off through unbelief.

### BIRMINGHAM ARCHITECTURAL ASSOCIATION.

AT a meeting of this Association on January 8, Mr. E. Preston Hyth (secretary to the School of Art) gave an address entitled "The Architect as a Teacher." It was the duty of the architect, he said, to stimulate work in the allied arts. He could render to the community great service by facilitating the employment of worthy sculptors, mural decorators, wood-carvers and others. In this way his influence would also penetrate beyond those craftsmen working immediately under his supervision. This intimate connection between the arts was clearly recognised in America. The attendance of young architects at the various classes of the Birmingham Municipal School of Art was fraught with advantage to all concerned. It would be worse than a paradox if a community which spent large sums upon art education should itself erect unworthy buildings. The possibility was considered of appointing, in connection with the First Commissionership of Public Works and Buildings, an advisory council of leading architects, chosen on representative lines; precedents could be found for the establishment of such a council. Giotto would not have done his great work at Florence had he not been appointed master of the works of the cathedral and architect of the city wall and of the towns within her territory. Attention was also called to the fact that, at least since 1885, no member of the Birmingham City Council was in the municipal diary described as an architect. Birmingham did not stand alone in this matter, which was noticeable in view of the development of local duties and of their interest and importance to architects. In conclusion the lecturer summarised the work of the Municipal School of Art. A hearty vote of thanks was passed to him, on the motion of the president (Mr. William Henman), seconded by Mr. H. T. Buckland and supported by Mr. W. H. Bidlake.

### HEIGHTS OF HOUSES IN PARIS AND BRUSSELS.

AN inquiry is in progress by the Board of Trade and Transportation in New York concerning the height of houses in cities. Mr. E. G. Wilson, president of the Health Department, supplied the following summary of the regulations of the authorities in Brussels and Paris regarding the limitation of the height of buildings:—

#### Brussels.

The height of house frontages in public streets is determined by the width of the street. The maximum height of frontage is:—

1. Twenty-one metres (68'88 feet) on public places, boulevards and streets of 15 metres (49'2 feet) wide and upwards.
2. Twenty metres (65'6 feet) in streets 14 metres (45'92 feet) wide.
3. Nineteen metres (62'32 feet) in streets 13 metres (42'64 feet) wide.
4. Eighteen metres (59'04 feet) in streets 12 metres (39'36 feet) wide.
5. Seventeen metres (55'76 feet) in streets 11 metres (36'08 feet) wide.
6. Sixteen metres (52'48 feet) in streets 10 metres (32'80 feet) wide.
7. Fifteen metres (49'20 feet) in streets 9 metres (29'52 feet) wide.
8. Fourteen metres (45'92 feet) in streets 8 metres (26'24 feet) wide.
9. Thirteen metres (42'64 feet) in streets 7 metres (22'96 feet) wide.
10. Twelve metres (39'36 feet) in streets 6 metres (19'68 feet) wide.
11. Eleven metres (36'08 feet) in streets 5 metres (16'40 feet) wide.
12. Ten metres (32'80 feet) in streets 4 metres (13'12 feet) wide.
13. Eight metres (26'24 feet) in streets 3 metres (9'84 feet) wide.

The height of frontages is taken at the middle of the buildings from the pavement to the cornices of the coping, so as to include attics. The width of public roads is measured from the face of the frontage walls.

#### Paris.

The height must not exceed the following measurements, taken from the footway or from the pavement at the foot of the façade of the building, including the entablature, attics and all erections plumb with the front walls.

Ten metres (39'36 feet) for public roads less than 7'8 (25'58 feet) metres wide.

Fifteen metres (49'2 feet) for public roads between 7'8 (25'58 feet) and 9'74 metres (31'95 feet) wide.

Eighteen metres (59'04 feet) for public roads between 9'74 (31'95 feet) and 20 metres (65'6 feet) wide.

Twenty metres (65'6 feet) for roads, squares, cross-roads, streets, quays, boulevards, twenty and more metres in width.

The mode of measure indicated is not applicable to buildings on a slope, except those whose length does not exceed 30 metres (98'4 feet). Beyond that length the buildings must be lowered according to the declivity of the ground. If the architect builds several detached houses, the height must be measured separately for each according to the rules above mentioned. The height of buildings bordering private paths, passages, blind alleys, &c., must be determined according to the width of these roads or spaces, in accordance with the rules fixed for ways or spaces adjoining the public roads. Whatever the character of the buildings, more than seven storeys above the ground floor, including the entresol, can never be allowed.

### THE CASE AGAINST THE ECOLE DES BEAUX-ARTS.\*

THE title which the Secretary of the Society and I selected for the very short paper I am going to beg you to listen to with such Christian charity as you possess is hardly descriptive. It is a little in the line of a "scare-head," and I want to modify it. I don't mean to savagely attack the Ecole des Beaux-Arts, and, by implication, all other architectural schools where the academic system of instruction is in vogue. If I wanted to I should not have the right, for I never had any practical experience in any school of that kind. I should be adopting the malodorous tactics of a certain notorious personage in this city, who proceeded to damn the exquisite statue of a Bacchante, now flitting elusively through the courts of the library, before he had seen it.

What I do want to attempt, however, is an inquiry into the methods and results of this system of education, with a view to finding out if it is not defective in certain directions.

\* A paper read by Mr. Ralph Adams Cram before the Boston Society of Architects and published in the *American Architect*.

Ever since I came to look on church-building as one of the most promising fields of architecture, and as one of the most dignified and satisfying as well, I have been thinking more or less about the present system of architectural instruction, which by implication denies that architecture existed between the fall of Rome and the sixteenth century, and also ignores the fact that churches are ever built nowadays, or that they are a legitimate subject for an architect's consideration. The more I thought about this curious phenomenon the more remarkable it appeared, but I set it down to the rationalism that pervaded every department of life until a few years ago. Of course it was impossible for atheism to acknowledge any beauty in the work which owed its genius and its very experience to an exploded superstition, while it was equally impossible that the buildings which were grotesque anachronisms, the outward expression of a fast perishing folly, should be looked on as matters of the least importance. Under the circumstances, ancient and new paganism were the only modes of civilisation that offered anything of value as models for contemporary architecture.

I still think this motive lay at the bottom of the thing when the present method of architectural education was evolved, but during the last year or two various things occurred which led me to think that other criticisms might be brought against the accepted system besides its ignoring a very important branch of the art and doing nothing to assist students to acquire some knowledge that would be of use to them in this field. Among other things I became convinced that much time was wasted in acquiring useless methods and information, that false canons of taste were often laid down, that enormous labour was wasted in cramming the mind of the student with the most minute details of construction, strength of materials, &c., in order to fit him for practical work, while almost nothing was done to help him to tackle the only problems that in all probability would come before him for the first ten years of his practice.

I mean to speak of these things more explicitly by-and-by, but first I want to tell you just what the events were which brought me to my present position of antagonising this system of classical education.

Well, first of all, some time ago I knew a young draughtsman who was enthusiastic and eager to acquire all the useful information he could find. He joined a class in planning, directed by a very brilliant representative of that system which prides itself enormously on its prowess in this particular direction.

There was trouble from the start. This boy was practical to a degree and loaded with common sense. He soon found out that the questions of convenience in arrangement of rooms, their dimensions, economy of space, adaptation to function, harmony with environment were secondary considerations. There was one great thing to be obtained, and that was a decorative plan. The lights and darks must be well proportioned. Formality and perfect balance were indispensable, and a finely-drawn piece of mosaic flooring made amends for a deplorable lack of light.

In fact, he was really engaged in decorative design, not in architectural planning.

Diplomatic relations finally ceased in this wise: he grew weary of designing impossible city halls and inadmissible Italian villas, and handed in—horrible to relate—a scheme for a large village church, English Perpendicular in style and carefully arranged with regard to its needs and possibilities. Of course, he did very wrong to do this; he should have known that a country church is not to be spoken of in academic society. The plans went in, however, and there was war. When the instructor got his breath he tackled the awful situation bravely—for he was a conscientious man. I saw the result afterwards when the smoke had cleared a little. What had been a good plan, well adapted to its functions and laid out with due regard to cost and surroundings, irregular of course, and capable of very picturesque though quiet treatment, had become a nice study in black lines and spots, and white areas beautifully proportioned to them. It was admirably done and would have made a charming figure in a formal wall-paper, but it would hardly have commended itself to a building committee.

So far as the exterior was concerned, the revolution was complete. Every vestige of English spirit was gone and Montmartian Romanesque had taken its place.

A little later, a friend in whom I was very much interested and who was just about to graduate from the architectural department of a prominent school, asked me if I did not think it would be a good idea for him to submit a design for a Gothic church as his thesis. I remembered the experience of my friend the draughtsman, and tried to dissuade him from his insane idea. He persisted and fought nobly. Day after day with tears in his eyes he told me how his cherished plan was being maltreated, until it was fast becoming that kind of thing one finds in trade-books on church-building. At last he gave up the unequal fight, for he had been kindly but firmly advised that he was running an awful risk in sending in such a thing

as a thesis drawing of a Gothic church. He began again, and achieved a proud success with an Italian villa, in which the toilet-room and breakfast-room were beautiful oval apartments of equal size, balancing nicely, while the library occupied one projecting wing, the kitchen the other—the external treatment being identical.

Finally, one of our boys wanted to take a course in an architectural school, and asked my advice as to where he should go. I did my best to study up several schools, and in the process I found out things I had never known before. In one school the academic rendering was something exquisite, and the beauty of the transparent shadows and the lovely small trees was only equalled by the fabulous size of the sheets of paper on which a little square of plan was magnificently surrounded by the most wonderful gardens. I reflected, however, that it took a month of a boy's life to create one of these charming things, and that after he left the school no conceivable circumstances could arise which would lead him to indulge in this form of decorative art, and so modified my admiration.

In another school I was assured that the system of instruction was modelled with absolute fidelity on that of the Ecole des Beaux-Arts, but I reflected that in America a young architect's duties are chiefly the designing of country houses and churches, and that the results achieved in these lines by the output of the Ecole—so far as France is concerned—are not brilliantly successful. Finally, I recommended the architectural course at Harvard as the most practical and logical, and as the one least accurately modelled on French lines, and I have no reason, thus far, to regret this decision.

The result of my experiences and investigations was that I became convinced that the accepted system of education, as we see it in the Ecole and in practically all but one of the schools in America, did more harm than good, and I want to justify this position if I can.

First of all, however, I must declare my intense admiration for certain principles held in this system, and my gratitude for the influence exerted. It is unnecessary to plead for these things, however, for everyone admits them. One is the steady curbing of a student's tendencies towards fantastic originality, silly picturesqueness, crazy irregularity. I doubt if this work could be done better than it is, and it is imperative. It is about the only thing that can reform architecture in America and redeem it from its only too often fantastic absurdity. There are many other fine points in the system: the thorough grounding it gives in the Classical orders, the training it affords in proportion and composition, the solid kernel of good in its system of planning; but if none of these existed the first *raison d'être*, the civilising of barbaric impulses, would be cause for praise and admiration.

On the other hand, the faults are, I think, quite as clear and deserving of sincere condemnation.

Many of these faults, while not very grave in themselves, have a mischievous effect for the reason that in too many cases young men are subjected to them at just the wrong time. If a man could have three or four years' experience in an architect's office, then travel for a year or two on the Continent and in England, he would be proof against bad influence; his taste would be formed, practical ideas and the nature of everyday requirements would be instilled into him, and he would then be in a position to reject the bad and accept the good. And he would do this. Very few men, after a little solid experience and a fair acquaintance with the architecture of Europe, could fail to see through some of the methods and principles with which he would come in contact in the Ecole. This course is seldom pursued, however, and a raw, unformed youth goes through an American architectural school, and then passes directly to the Ecole, and the result is that in many cases his taste is vitiated, and he is in no position to select the great good which is afforded him, together with much of what I think very bad, and which if he would succeed he must diligently forget.

I have had occasion to advise a lot of boys as to how they should educate themselves for the architectural profession, and in every case I have urged them to get a little practical experience first, then see all they can of the art of the past, and then go to some academic school.

Admitting, then, that students are themselves largely to blame for the harm done them, since they start at the wrong end, let us see just what the harm is, at least, let me suggest what it seems to me to be, for I can only express my own feelings in the matter. I have no right to claim to represent any one else.

In the first place, the education in design is not practical; it does almost nothing to fit a man for actual practice. In the American school a student is crammed with stores of information that belong by right to civil engineers, sanitary engineers, specialists and experts. Judging from the list of studies in any four years' course, one would conclude that the object was to turn out men who could start in business the day after they took their degree, armed at every point and absolutely independent of experts and engineers

for all time. Look at the artistic side and you find the exact reverse. In nine cases out of ten a man just through an architectural course has never designed a country house, an eight-room schoolhouse, a country church, an apartment house or any other of the very things which alone he can get a chance at for ten years of his professional life. His custom-houses, post-offices, city halls and public baths have been designed for 10-acre lots, and with a ward politician's disregard of expense. He has been taught to space his voids and solids with exquisite delicacy, but in almost no case can he yield to this instinct in the future, for the conditions will not allow it. If by good luck he gets a chance at some big public building he lays out the plan on a system of units, and when it is too late he finds that hot-air ducts and exhaust flues have played tag with them. He has a twelve-storey office-building sprung on him, and looks in vain for scholastic precedent. Finally in despair he takes a lot of theses and pastes them together, one above the other, and trusts to the great American public to justify him.

Submit this statement to an advocate of the schools, and he will waive it away. "We teach the great fundamental principles of the art; we cannot concern ourselves with the details." But that is just what the poor architect has to do, and until he has made his reputation designing houses and churches, and his fortune building steel-framed slices of office-buildings, he must keep his mouth shut as to the great principles of the art.

Of course, it seems to me that it is a crime and an outrage for any alleged system of architectural instruction to ignore the great centuries of the Middle Ages, to deny that there ever was such a thing as Gothic architecture, and to forget that churches are still to be built. I am an awful fanatic on these points, and so I don't dare say very much about them; but it is my solemn conviction that, if we ever succeed in civilising ourselves, we shall one day admit that Gothic architecture is just as perfect in style, just as solidly based on knowable laws, just as representative of high civilisation, as the architecture of corrupt and tottering Rome and of the immoral Renaissance; while in impulse, in spiritual power, in beauty of line and mass, and light and shade, it is incomparably more worthy of study and of admiration.

Nor is the argument that it is unfitted to modern uses valid for a moment. It does not go in the matter of office buildings and synagogues. And Unitarian churches and city halls, of course, nor ever can until both style and requirements are modified by time. It is not in harmony with modern civilisation; it is an anachronism that also is sure. But it is in harmony with the nature of those still vital institutions, the Roman Catholic and Anglican Churches, which are still blazing anachronisms—thank God.

Yet the great period of architecture when it was essentially Christian, that period which expressed itself in a form which is incomparable for splendour of imagination, loftiness of spirit, sublimity of inspiration, absolute, abstract beauty of form and composition and design, has no place in the modern system of academic instruction, and I propose to hold with all the vigour I can command, that a system that wilfully shuts its eyes to all this marvellous period of art, so instructive, so civilising, so full of inspiration, is a bad system.

*To be concluded.)*

## TESSERÆ.

### Cromlechs.

THE interest of these wonderful relics consists mainly in the appeal which they make to the imagination. It is open to the mind to people times about which history is absolutely silent with men of any race, speech or social condition which it may think good. It is open to it to conceive objects of whose use or origin we have absolutely no record, as being brought into being for any end which it may think good. The imagination may work in very different ways on subjects of this kind. It may work in a discreet way, under the guidance of good sense and sound inference, or it may run about in an utterly frantic way, in any direction in which the unbridled impulse of the moment may lead it. In the former case it may reach conclusions which sometimes are hardly less certain than the conclusions to which we are led by direct evidence. A chain of links, each of the nature of internal evidence, will sometimes have a cumulative force inferior only to the very highest forms of external testimony. But, on the other hand, people who have a mind to be wild cannot be hindered from being as wild as they please on subjects where there is no direct testimony to restrain them. It is capable of demonstrative proof that a cromlech was a tomb; it is capable of proof almost demonstrative that it was not an altar. It was undoubtedly a tomb, because the remains of the persons buried have been over and over again found within it. But this argument alone would not prove that it might not be an altar as well. Perverted ingenuity might say that the remains were the remains of human victims who were first sacrificed on the top and then buried underneath. It goes a good way to shake any such theory that the top stone is always

found with its curved face upwards and its smooth face downwards. This is clearly the arrangement best suited for the building of a tomb; it is equally clear it is the arrangement worst suited for the uses of an altar. The stock answer we believe is that it was so put to make the blood run off more easily. This explanation seems wild enough, but there is no knowing what such people as those must have been who built cromlechs at all might not do. It is still more difficult to evade the facts that the cromlechs as we have them are mere ruins—that as the dead man has been dug out of his tomb, so his tomb itself has been simply detached from the mass of earth and smaller stones which originally covered it. About this there is no doubt in some cases; in others the belief solely rests on the argument from analogy. These last, the genuine Arkite or Cuthite would doubtless affirm to be a distinct class, and he would maintain that to these at least his cherished theories applied in their fulness. Nay, he might argue that, even in the cases where the cromlech has been actually disinterred from within its barrow, the persons buried were first sacrificed, then buried and lastly covered over.

### Pietro Perugino at St. Giusto.

The cloister and the church itself were the localities where the painters chiefly worked. Their choicer materials were often prepared by their employers; and fortunate was the artist, if otherwise skilful, whose lot happened to be cast among a community celebrated above others for attainments in chemistry. Such was, for example, the advantage which Pietro Perugino enjoyed when he resided with the monks of St. Giusto alle Mura. The description which Vasari has left of that convent—in ruins even in his time, and now no longer to be traced—may throw some light on the habits of the monks at earlier periods. "Above the chapter-house was a large room where those fathers occupied themselves in making glass for the windows with the furnaces and other conveniences necessary for such operations; and as Pietro, while he lived, made the cartoons for these, all the works of the monks produced in his time were excellent." After speaking of the beauty of the garden and of the careful manner in which the vines were trained round the cloisters, the historian continues:—"In like manner, the room where, according to their custom, they distilled odoriferous waters and medicinal preparations was furnished with every apparatus of the best kind. In short, that convent was among the most complete and best arranged in the Tuscan state; and I have been desirous to leave this memorial of it, because the greater part of the pictures which it contained were by the hand of our Pietro Perugino."

### Restrictions of Greek Painting.

It may be questioned whether the sculpture of the Greeks was not confined in its aim almost as much by the nature of the art as by the conditions of Paganism. As it was, the ancients seem to have felt the difficulty of combining (in permanent representation) ideas of suffering with those of beauty and physical power, and they generally contrived to restrict the expression of such ideas to the forms of early youth or of age. But, if we may judge from the descriptions of subjects and from inferior works which remain, they observed the same principles in painting, and this tends to show that they had not fully comprehended or developed the powers of that art. The less restricted means, and therefore less exclusively abstract treatment of form, which painting, as compared with sculpture, employs, its variety and individuality of character, its command of colour and light as vehicles of expression, and its "power of dealing with the eyes," constitute a language which leaves it free to assert the claims of the moral human being consistently with the full use of the best attributes of art. It was the high privilege which during the great epochs of its modern culture enabled painting more sensibly to define the relation which in all ages has been vaguely felt to exist between the beauties of nature and the moral government of the universe, for it was not till that moral order had been fully revealed and its possible connection with finite conditions ratified, that the relation could be distinctly felt.

### The Theory of Architecture.

When the revival of classical literature produced, as a natural consequence, the revival of the study of ancient art and monuments, then the enlightened men of the sixteenth century applied themselves to the patient and earnest investigation of those relations which obtained in the edifices of classic antiquity. They laid down the rules and laws of proportion in regard to the orders dimly shadowed by Vitruvius. These canons have been misunderstood and misrepresented in later times, and never more so than in the present. They were offered as elementary, liable to change as taste and refinement of perception might suggest, but they have been considered as arbitrary and empirical trammels to taste; and what were meant as merely proximate results have been assumed to be positive and final. Mediæval art has not, as yet, been so investigated, and some may say it never can be. Can positive

proportions be laid down as to the relations in size in the several parts of a column, the base, shaft and capital, in the group of a range of mouldings, in the mutual relations of proportion in the apertures of doors or windows, or in their respective dressings? No law has been discovered in the relative bearings or openings of arches of naves in their breadth and height. The just width and height of a nave, or tower, or spire have still to be ascertained. Who has yet had the patience or grasp of mind philosophically to dive into the mysterious relations and parts which constitute the beautiful in the choir of Lincoln, in the nave of Westminster Abbey, in the façade of Cologne, or in the massive energy of Durham? Whence the source of the impressions which these remarkable structures produce? In what consists the grand peculiarities of Greek art? Its moral grandeur and unequalled purity are not merely legendary, nor is our admiration based upon our religious feelings, as is the case with Mediæval productions. Our recognition of their power is apart from all passion. Our reverence rests upon objects devoted to a distinctly different theological origin. We have no immediate affinity of customs, thought or literature in common with those of the times in which they were produced. May we not be considered as impartial judges, uninfluenced by considerations that might otherwise warp the judgment, when we bow with reverence to the mighty genius of the Greeks in art and in letters?

### English Mediæval Sculpture.

It has been asserted that, during the Middle Ages, all the western countries of Europe produced remarkable works of sculpture; but it was in Italy alone that art attained to a perfection worthy of comparison with the antique, and in Italy alone can its monuments be thoroughly studied. Let anyone, however, go to Wells, Lincoln, Peterborough, Westminster Abbey, or several other of our glorious Mediæval churches and cathedrals—without asking him to cross the sea, and wander over France and Germany—and a first short view will give him magnificent examples of sculpture done by Englishmen in England better than anything of the time abroad, which, considered under the more essential aspects of art, were never surpassed, and not often equalled by the most celebrated productions of ancient Greece or modern Italy. What has been done may be done again in England by Englishmen. Richard II. granted a license to Cosmo Gentili, the Pope's collector in England, in 1382, to export three great images of the Blessed Virgin: Mary, St. Peter, St. Paul, and a small image of the Holy Trinity, without paying duty for them. Who can tell but, some future day, London will once more send statuary to Rome?

### Early English Painted Glass.

Early English painted windows are in general almost entirely composed either of coloured glass or of white glass. The coloured windows are nearly exclusively appropriated to pictures and the white ones to patterns. Both are usually surrounded with a wide coloured border, returning along the bottom of the window. The coloured windows are perfect mosaics, of the most vivid, intense and gem-like tints. Their tone of colouring is deep, harmonious and rich, but not gay; they exclude more light than perhaps any other painted windows, and their general effect is extremely solemn and impressive. Some windows of this description, from the smallness and number of the pieces of glass they contain, present at a distance only a rich and confused assemblage of various colours, their design being as little defined as that of a Turkey carpet, to which they have often been likened. The white windows have a remarkably brilliant and silvery, though cold appearance, owing to the greenish blue tint of the glass. Their effect is grand and imposing, especially when the window is of considerable magnitude. There are three principal classes of coloured windows in this style, which for the sake of convenient reference may be termed medallion windows, figure and canopy windows and Jesse windows.

### Light in Art.

Light may be considered as the representative of an important element of beauty everywhere traceable in nature, and it is the more worthy of attention since the fine and scarcely perceptible modifications which it exhibits may serve to correct an exaggerated stress or distinctness of character. As the type of gradation it embodies and illustrates the principle that no creature, no form, no colour stands alone in nature; but that every such result is what it is by means of a chain of degrees attesting either its relative or absolute excellence. Light is, therefore, the abstract idea of that "greater and less" which has been before illustrated in reference to organic form. It is the antithesis to colour, though its source. Colours, unbroken by the varieties of light, differ in kind rather than in degree. They owe their harmony to gradation, and thus only become adapted to the completeness of nature. The effect of light on forms is the illustration and epitome of the same principle. The boundary is lost and found, and is commonly most relieved

where it is most significant. The acme of splendour is one, for if repeated in brilliancy it is smaller in mass. The general appearance teaches that unvaried sharpness or unvaried softness are alike untrue; that equal distinctness is, in its ultimate impression, indistinctness; and that where all is salient, the prominent fact is still wanting.

### Captain Baillie, the Eteher.

William Baillie, who was born in Kilbride, co. Carlow, in 1723, having served for some years in the wars of the time, was allowed by the Commander-in-Chief to sell his commission, as a reward for the long and severe service he had undergone. He had, after the engagement under Prince Ferdinand, amused himself with drawing the plan of the battle of Minden, which plan he gave to a brother officer, and by some means it found its way to Ferdinand, who sent him a present with his compliments, as a return for the pleasure which His Highness received from it. When Captain Baillie retired from the army he was made a commissioner of the stamp duties, in which situation he acted for twenty-five years, and retired with a pension from that board which he enjoyed until his death, which took place in December 1810, in the eighty-eighth year of his age. The productions of art by Captain Baillie partake of professional excellence. At what time he took up engraving is uncertain. The portrait "scraped" by himself after a picture by Hone is highly creditable to his talents; the figures supporting this portrait are by Caroline Watson. He has also engraved above one hundred plates after various masters, fifty of which were published about the year 1774, in one volume, by Walter Shropshire, in Bond Street. In 1804 he was engaged in another volume, part of which had already been before the public. It is said that his productions have fetched much higher prices at Dutch auctions than they ever did in England. In some of his works he has blended mezzotinto and etching with great success, as may be seen in his portrait of Vitenbogaard, the goldweigher, after Rembrandt. He was much employed in forming collections of art for several of the nobility, among whom were those of Lord Bute and Lord Liverpool's at Addiscombe Park; and he patronised Richard Wilson, the landscape-painter. Captain Baillie married between seventy and eighty, and had several children; these he has made the subjects of his pencil, as a study of naked cherubims, in the style of Rubens. In granulating his plates he used turkey stone, a medium resorted to by the celebrated Meilan. In the study and prosecution of the arts, Captain Baillie was heard to say he passed the happiest hours of his life. "Pursue the arts," said he once to a young friend, "with the satisfaction and avidity which I have, and they will prove a source of comfort and pleasure to you when you are old." Among the works of Captain Baillie is an etching by Rembrandt, restored by the captain, who found the plate among some old copper. He died in 1810.

### GENERAL.

**M. Detaillé's** water-colour drawing of the review at Chalons, which was executed on a commission from the French Press, has been sent to the Emperor of Russia. It is considered to be a successful work.

**The Committee** of the Society of French Artists for the years 1897, 1898 and 1899 will consist for the section of architecture of MM. Loviot, Garnier, Daumet, Laloux, A. Normand, Pascal, Raulin, Ginain, Coquart, Redon.

**Mr. W. Burton, F.C.S.**, will on Monday next commence a series of four Cantor lectures at the Society of Arts, on "Material and Design in Pottery," and which will treat of simple earthenwares, faience and fine earthenwares, stonewares and porcelains.

**Mr. W. Galt Millar, F.S.I.**, architect and surveyor, Reading, has taken into partnership Mr. W. J. Nasmyth, member of the Society of Architects, London, who will carry on business with him under the style of Millar & Nasmyth, at Reading, and at 43 Cornmarket Street, Oxford, Mr. Nasmyth devoting his time exclusively to the interests of the Oxford branch.

**Mr. John A. Gill Knight, A.R.I.B.A.**, architect, has removed to 21 Godliman Street, Doctors' Commons, London, E.C.

**The Society of Engineers** will hold one ordinary meeting a month from February until June, and also during October, November and December next, at the Royal United Service Institution, Whitehall.

**Mr. W. T. Robson**, architect, of Newcastle-on-Tyne, died rather suddenly in the local infirmary on the 11th inst.

**The House** where Keats died, in the Piazza di Spagna at Rome, is not at present being used for purposes which are worthy of the memories which enshrine the name of this English poet. The fact that Keats died in the house in question on February 24, 1821, is recorded on a white marble tablet affixed to the wall, and that is all.

# The Architect.

## THE WEEK.

AN example of what can be done in the pursuit of science and with success under adverse circumstances was brought before the meeting of the Geological Society of Glasgow on the 14th inst. Mr. J. S. M'LENNAN read a paper on "Eolithic Flint Finds near Ightham, Kent," and in the course of it he referred to the investigations by a local student of prehistoric archæology, Mr. BENJAMIN HARRISON, "grocer and geologist." Led on to the study of natural history as a boy by the perusal of WHITE's "Selborne," Mr. HARRISON afterwards took up the kindred sciences of geology and archæology. The discovery in France of flint implements in the valley of the Somme induced him to examine the valley of the Shode near his native village, and afterwards the Holmesdale valley. In the gravels of these he found numbers of palæolithic flints. In 1885 he turned his attention to the surface of the chalk plateau, about 700 feet above sea level. Further investigations have pretty clearly shown that the plateau flints are of a ruder and older type than those of the river gravels in the valleys, and they are therefore now classed as eolithic, as distinguished from the later neolithic and palæolithic types. The late Sir JOSEPH PRESTWICH took a deep interest in Mr. HARRISON's work, and did much by his writings laid before London scientific societies to settle the debated questions of the human workmanship of these prehistoric flints and to bring the work of the grocer-geologist into the notice it deserved. It has been Mr. HARRISON's habit to keep a correct list of and to make a sketch of every specimen he has found, also to mark the place where it was discovered on a 6-inch survey map of the district. Most of his flint-hunting has been done after early dawn, so that he might get home in time to open his shop. Mr. M'LENNAN described his visit last year to Ightham, where he met Mr. HARRISON, after an inspection of whose collection he began to hunt for himself, and was successful in obtaining quite a number of undoubted implements. An account of these, and of the various localities where they were found, concluded the paper. In illustration the author exhibited his collection of flint implements, which was supplemented by another series from Scotch and Irish localities.

THE overflowing bog near Killarney was an unfortunate phenomenon for the people of the district, but it has given occasion to some of the students of science in Dublin for the display of their ability in drawing conclusions. It is needless to say there is no agreement about the cause of the flow, which has displaced about one million cubic yards of bog stuff. It was stated by Professor SOLLAS, at a meeting of the Royal Dublin Society this week, that there are records of eighteen similar occurrences in Ireland in the last century, while outside Ireland only four were known. It appears that the bog, immediately before the overflowing, was a viscous fluid enclosed within a peaty envelope. It is said of similar occurrences that they were caused by the pressure or onrush of subterranean water, and the structure of the country would lead geologists to suspect the existence of springs in connection with the bog in Kerry, and hence the eruption of water from below might very probably have played a chief part in producing the occurrence. The earthquake ten days previously may also have been a factor, as it was felt as far west as Miltown Malbay. Probably both of these causes contributed to the flow. Views and sections of the valley showing the effects of the flow were shown by Professor DELUP, Professor LLOYD PRAEGER and Professor GRENVILLE COLE, who were associated with Professor SOLLAS in preparing the report. Professor JOLY invited the submission of hypotheses to account for the occurrence, and said he thought the severe easterly gale that had prevailed on the previous night had been overlooked. Professor SOLLAS said that though he welcomed any hypothesis on the subject, still he did not think it necessary or correct to adduce the gale as a contributory cause. The committee were all of one mind in attributing the occurrence primarily to the influence of subterranean springs. It is to be regretted that in

Ireland, which is *par excellence* the land of bogs, they should not be in the very forefront in discovery regarding the effective treatment of them.

A MEETING has been held in Berlin to consider what course of action should be adopted in relation to the Paris International Exhibition of 1900 by the representatives of the German art industries. Delegates from the various districts attended. The first resolution arrived at was that there should be no representation of the works of particular states, districts, cities or towns. In the exhibition there will be no need to ask the old question, "Was ist des Deutschen Vaterland?" for all the objects in the German section will be evidence of unity. The whole arrangements will be entrusted to a commissioner who will represent the Imperial Government. Although the local character of the productions may not be manifested it is accepted as an obligation by manufacturers that they are to spare no trouble in order to ensure a display that will be worthy of Germany. It is also understood that the privilege of co-operating is to be regarded as a sufficient reward, for expectation of immediate profit is not to be calculated on.

IN the Prussian budget a sum of 500,000 marks is provided as an instalment towards the cost of erecting a new museum in Berlin, which is estimated at 5,850,000 marks. The site selected is the northern part of the island on which the royal palace, the National Gallery, the old museum and various other buildings now stand. The need of an additional museum is manifest to every stranger who visits Berlin. The accumulation of works of art has long outgrown the accommodation provided in the two museums which were completed in 1840. In consequence of the limited space the sculpture from Pergamus cannot be properly exhibited. Many other examples of ancient art may also be said to be entombed, for they are deposited in places which are only dimly lighted. The quantity of Renaissance sculpture is likewise an embarrassment to the curators. As in no other city are so many earnest students of art to be found, it is time some facilities should be allowed to them in their pursuit of knowledge.

MANY of the enactments of the French Code are enforced in Switzerland as well as in France. Among others is one fixing the responsibility of architects for defects in any structures they have designed. The term is ten years. The French architects have vainly endeavoured to obtain a discharge from their guarantees at an earlier period, but monarchical, imperialist and republican Governments are equally inexorable. In Switzerland the law appears to be more severe as it is of foreign origin. A committee of the Central Society of Architects and Engineers are endeavouring to get up a petition to the Department of Justice and Police praying for some relaxation of the obnoxious responsibility. Several of the cantonal societies have co-operated in the effort. But there are many objections to a change, and it is imagined that if the architects have many responsibilities, they have also many privileges.

THE third series of examples of "French Wood Carving from the National Museums" (B. T. BATSFORD) has appeared, and many will consider the plates as the most interesting of all. They bring before us examples of the seventeenth and eighteenth centuries. It was a time when old limitations were treated lightly, and the artists gradually obeyed no law but their own ability. Some panels are accordingly as freely treated as if they were copied from painted ornament. It is difficult to refrain from admiring them, and we need have no fear that English carvers will be tempted to stray so far from precedent. The carver of the subject shown on the last plate, a panel from the Musée des Arts Décoratifs, Paris, must have been an artist who was not bound to follow a pattern on paper, perhaps could not do so, but was able to create as he went on. A Gothic carver would be shocked at the indifference to the architect-uresque, but however heretical may be the composition it is gratifying to find that so much could be done by a man's hand. The other plates are of subjects which come nearer the possibility of imitation. The series should be possessed by every carver, and the plates can afford more pleasure to amateurs than those in the majority of technical books.

## FLORENCE AND TUSCANY.\*

IN one of the few written passages by Dr. JOHNSON, which the world is likely to remember as long as the reported fragments of his conversation, he said:—"Far from me and from my friends be such frigid philosophy as may conduct us indifferent and unmoved over any ground which has been dignified by wisdom, bravery, or virtue. That man is little to be envied whose patriotism would not gain force upon the plain of Marathon, or whose piety would not grow warm among the ruins of Iona." We need not say it is possible to be an excellent man and yet to remain unmoved by the power of association, which is supposed to be inherent in historic sites. COLERIDGE was one example. Although he was as sensitive to all refining influences as an Æolian harp to imperceptible currents of air, yet he acknowledged he could walk over the plain of Marathon without taking any more interest in it than in any other plain of similar features. In that obtuseness he was, as he pointed out, the opposite of Sir WALTER SCOTT, for whom every old ruin, hill, river or tree called up a host of historical or biographical associations. But as a rule healthy and instructed minds will be affected as JOHNSON desired, and as SCOTT was during every day of his life in Scotland. There are, of course, many degrees in the susceptibility to associations. But the humblest tourist who visits the North, although he may have the most elementary notions about Scottish history, sees enough to open his mind, and he generally returns with some respect for the ancient relations of feudalism. In the same way, after taking part in a cheap tour in Italy the most self-satisfied of cockneys will find he has enriched himself with ideas about art which are not obtainable by numerous visits to the metropolitan museums. He acquires much else which increases his knowledge about life in a former time which is sure to affect his native prejudices, and if he is not a wiser man on his return, at least he will be henceforth less conceited.

The educational effect which a short sojourn in Italy can produce is exemplified very clearly in the articles by that genuine representative of cockneydom, CHARLES DICKENS. When he arrived in Italy he judged everything by the London standard, and, of course, all seemed inferior in his eyes to what was to be found at home. But he discovered that Italy grew upon him as he became better acquainted with it, and, moreover, when he had acquired some acquaintance with the history of its artists and their works, there were fewer puzzles presented to his eyes. The man to whom noble figures on canvas or in marble were only coal-heavers or jolly young watermen was subdued by art, and in his last chapter we find him acknowledging its supremacy. "What light is shed upon the world at this day," he exclaims, "from amidst these rugged palaces of Florence! Here, open to all comers, in their beautiful and calm retreats, the ancient sculptors are immortal, side by side with MICHEL ANGELO, CANOVA, TITIAN, REMBRANDT, RAPHAEL, poets, historians, philosophers—those illustrious men of history beside whom its crowned heads and harnessed warriors show so poor and small and are so soon forgotten. Thousands upon thousands of faces, rigid with the strife and passion of the hour, have faded out of the old squares and public haunts, while the nameless Florentine Lady, preserved from oblivion by a painter's hand, yet lives on, in enduring grace and youth." And he closes his excursions by expressing the belief that "the wheel of Time is rolling for an end, and that the world is, in all great essentials, better, gentler, more forbearing and more hopeful as it rolls." DICKENS, who at first considered Italy was a country for which there could be no elevation, was unable to depart from it without expressing faith in its future happiness.

DICKENS represents one class of travellers who are deprived of the education or the sympathy which appears to create pleasurable feelings at almost every step in Italy. All they see suggests decay or death, and they are glad to escape from sights which they consider painful. Sometimes they try to conceal their own defects by proposing reforms

regardless of their unsuitability. There are, however, men belonging to another class to whom the country becomes, as it were, eloquent, and who can find more interest in ruins than in rows of modern factories. M. EUGÈNE MÜNTZ, the erudite conservator of the Ecole des Beaux-Arts, is one of the best types of them. From disposition, as much as from office, his thoughts are mainly occupied with the past, and his three large volumes on the "History of the Renaissance in Italy," his "Life of Raphael," and his numerous essays reveal that in considering the past he gives preference to the life of Italy. The splendid quarto he has completed, and which MM. HACHETTE ET CIE. have produced in a manner which suggests the esteem they have for the author, is a further revelation of the fascination which Italy exercises over M. MÜNTZ. People generally suppose that books of the size, being monumental, are bound to be oppressively serious and to be adapted only for occasional reference. In this case there is no heaviness or dullness. The author has delight in his subject and he endeavours to communicate what he feels. Italy is to him not merely a country abounding in beautiful scenes which can never pall upon the sight, but one which has become still more interesting through the efforts of its sons. Nature and art have combined to make Italy what it is, but while nature's works may be apparent to all, the majority of people are likely to be unable to appreciate art in any form unless they are guided, and as a cicerone M. EUGÈNE MÜNTZ is not easily surpassed. He has in his "Florence et la Toscane" described one part of Italy in a manner which hitherto was not attempted, and so many engravings have been introduced that a reader at his fireside can almost realise what is most interesting in the cities and country districts of which the author treats. Tuscany might not recall to Dr. JOHNSON heroism like Marathon, nor piety like Iona, although both qualities were often exhibited in its towns and fields; but for art it has only one rival, viz. a part of Attica. Rome itself was not so efficient an agent in the Renaissance as Florence. Acquaintance with such a representation of that city and its rivals as is possible in the book of M. MÜNTZ cannot therefore fail to be beneficial to all who believe that art should depend on realisation rather than on theory.

M. MÜNTZ begins with Pisa, the monotony of which he ascribes to the MEDICIS. He describes Florence as serving as the cradle of the Renaissance, Siena as personifying Gothic style, and Pisa as an incarnation of the Romanesque style in all its purity and grandeur. TAINE's description of Pisan work as "une renaissance avant la Renaissance" is adopted. To the President DE BROSSES there was nowhere "quatre plus jolies choses" than the cathedral, baptistery, tower, and Campo Santo of Pisa. DICKENS was afraid to do justice to them; but the play of lights and shadows through the tracery of the Campo Santo he considered could not be forgotten by the dullest mind. M. MÜNTZ considers the cathedral to be more interesting in itself than in its pictures or statues, "le contenant l'emporte ici sur le contenu," but as becomes the historian of the Renaissance he is not satisfied with so much unity. It does not offer us, he says, like other Tuscan monuments, the résumé of styles which succeeded each other since the Middle Ages, the picturesque mélange of productions of various epochs; the fourteenth, fifteenth and sixteenth centuries are only represented by isolated works; the archaeologists may be gratified by so much unity, the artist deplures it. DICKENS was much struck by ANDREA DEL SARTO'S *S. Catherine* in the cathedral. M. MÜNTZ also mentions it, but he prefers the *Sacrifice of Isaac* by SODOMA, which he considers worthy to hold a place between pictures by CORREGGIO and TITIAN. M. MÜNTZ is evidently wearied of the Leaning Tower from seeing so many reproductions of it, but he admits that Pisa lives on the *tour de force* of which accident rather than intention was the origin. It is impossible to study the baptistery without reflecting on the phenomenal success of NICOLAS of Pisa, whose sculpture was undoubtedly adapted from pagan examples in some cases, and possibly was never original. It is remarkable that the indebtedness was not detected by contemporaries, owing, we suppose, to the prejudice against antique examples which made simple folks afraid to look on them. Excellent as are the transformed gods and goddesses, M. MÜNTZ is right when he says they are not

\* *Florence et la Toscane, Paysages et Monuments, Mœurs et Souvenirs Historiques.* Par Eugène Müntz, Membre de l'Institut, Paris. Librairie Hachette et Cie.

comparable in nobleness of composition or gravity of style with the saints in stone carved by the French "ymagiers" about the same time in Paris, Rheims, Chartres, &c. JOHN of Pisa possessed some of his father's ability, but M. MÜNTZ is careful to point out his indifference to architectural lines in his pulpits and to scale in his reliefs. In the Campo Santo the two principal wall-paintings are *The Last Judgment* and *Triumph of Death*, which are commonly said to be the work of ORCAGNA, but all M. MÜNTZ can say is they are conceived in his style and are worthy of his pencil.

Mr. RUSKIN has remarked that the destiny of Pisa was probably changed by the Maremma, the dreary marsh which lies between the old city and the seashore. Power was in the people, but it could never be fully exercised. There is less chance of activity than ever, for Pisa is now overwhelmed by officialdom. M. MÜNTZ tells us of the hangers on in the prefecture, the nine judges, the chancellor, the sixty-three advocates, the sixty-four procuratori, the six causidici, the fifteen notaries, the departments of public property, registration, hypothecs, cadastral survey, contributions. In the university there are sixty professors, besides fifteen officials. There is a battalion of clergy, and since the suppression of convents the number of religions has increased. It is difficult to resist the conclusion that Pisa suffers from being under an excess of control, and probably the same cause has been at work for centuries.

Lucca is also rich in Romanesque examples, although few Italian cities have suffered so much from destructive powers in Mediæval times. It was a tempting prize to adventurers, but afterwards it was compensated by a long period of prosperity. For a time it was, at least, equal in power to Florence. The city was never, however, productive of great artists, MATTEO CIVITALE is perhaps the best representative, and in consequence patronage was liberally bestowed on Lombards and Florentines. Among the churches, M. MÜNTZ gives preference to S. Frediano, S. Michele and S. Martino. As a rule, the Luchese basilicas have more ornamental exteriors than those in Ravenna. Of Gothic and early Renaissance architecture there are few examples. But there are several fine paintings in the city, one being FRA BARTOLOMEO'S *Madonna with St. Stephen and St. John Baptist*, and with the famous singing angel which many artists consider to be the painter's masterpiece.

Empoli contains only 6,000 inhabitants, and as a railway junction it is better known than as a historic place. It is up to date, for M. MÜNTZ was greeted at the station with cries of "Vuole rostbiffe?" and among the first objects that met his eye was a bazaar in which any article was obtainable for 44 centimes. The public buildings were also disfigured with remains of electioneering placards like those in Paris. According to FRANCIS WEY, there are dramatic souvenirs of the contests in Florence to be found in Empoli, and masters of the Renaissance have embellished it. The principal building is the cathedral, which dates from the eleventh or twelfth century. The exterior recalls Pisa and St. Miniato, but the interior has been modernised. A *Pieta* is supposed to be the work of MASACCIO, and a font is attributed to DONATELLO. One of the chapels was converted into a sort of musée, and contained from sixty to eighty works by some of the Primitifs, probably pupils of Giotto; but since M. MÜNTZ visited Empoli the collection has been transferred to the town hall. There are some remarkable examples of sculpture, among them being a *St. Sebastian* by A. ROSSELLINO. Altogether, Empoli is a town which deserves the attention of amateurs.

M. MÜNTZ says that only about twenty-five years have passed since the marvels of Siena were revealed to Frenchmen by Dr. CONSTANTINE in the publication "Tour du Monde." In those days only a few cities in Italy were known to them, but now French visitors are not strange in the city which the Florentines feared and despised. The inhabitants may still continue to be as they were described by FORSYTH, viz. "vain, flighty, fanciful and wanting the judgment of their Florentine neighbours, who call a nail without a head *chiodo Sanese*." But how prized by the rest of the world should be a city in which, as M. MÜNTZ says, "sixty churches, some of them in the front rank, an equal number of palaces, besides statues, paintings, ornaments, in fact a school of art, it might be said a civilisation, are

crowded into an area of a square league." Siena was faithful to Mediævalism when most other parts of Italy had gone over to the Renaissance. In no other city of Italy is fourteenth-century architecture so abundant. The pictures of the Sienese school are supposed by some enthusiasts to be unsurpassable. Even BURCHARDT pays a tribute to the religious fervour, the flow and symmetry of line, the richness of colour and the delicate ornamentation on the dresses of the figures in the altar-pieces and frescoes. But the only department in which the modern inhabitants have approached their predecessors is in such humble work as marquetry, ironwork and wood-carving. M. MÜNTZ is glad to be able to record that higher prices are paid for such work to the Sienese than to the Florentines. The engravings in the volume do justice to the buildings, sculpture and paintings which belong to the times when art flourished in the city. What is said by M. MÜNTZ about the characteristics of Siena expresses the conclusions of every intelligent visitor:—"There exist in Italy, France and Germany cities which are as well conserved; it is not, therefore, from being an unique vision of the past that the infinite charm of the Tuscan city is derived, but rather from the variety and the refinement of its civilisation, and from the fertile mysticism which for more than three centuries has penetrated and animated all the forms of its intellectual activity. Among the cities of Tuscany Siena alone could measure itself with Florence; it incarnated the triumphs of the Middle Ages with as much *éclat* as its rival incarnated the spirit of the Renaissance, the modern spirit."

The account which M. MÜNTZ gives of his visit to the disused Benedictine monastery of Monte Oliveto is most interesting. It was founded in 1313 by BERNARD TOLOMEI, professor of law in the University of Siena, who, with two of his friends, retired to the Mount in order to live like the old hermits. Since 1866 the convent buildings are national property. The stalls which belonged to the chapel, and were the work of the famous marquetriss FRA GIOVANNI, of Verona, were sent in 1813 to the cathedral of Siena, and were replaced by other stalls from the cathedral by the same artist. But what gives most interest to the convent are the noble paintings by LUCA SIGNORELLA and GIOVANNA RAZZI, called "Il Sodoma." Both artists have depicted scenes from the life of St. BENEDICT. Those of the younger artist, "Il Sodoma," now find more admiration, and are suggestive of the influence of LEONARDO DA VINCI.

M. MÜNTZ next visited Pienza, where stands the neglected Piccolomini Palace, which was erected from the instructions of Pope PIUS II. by BERNARD ROSSELLINO about 1462. It consists of an elevated ground floor, with two storeys above. The masonry is polished ashlar, and the windows are separated by shallow pilasters. If compared with the works of PIUS II. in Rome the palace appears very severe, owing to the absence of marble and decorative elements. Another small but interesting town described is Montepulciano, where there is a picturesque town-hall.

(To be continued.)

## ROYAL INSTITUTE OF BRITISH ARCHITECTS

ON Monday last the prizes awarded in the annual competition of the Institute were presented to the winners, Professor Aitchison, A.R.A., presided.

The proceedings commenced with a short address by Mr. F. Warren, announcing that the late Mr. David Brandon had bequeathed a sum of 1,000*l.*, free of legacy duty, to the Institute for the promotion of architecture. Mr. Warren said he need not give a detailed account of Mr. Brandon's life and works. He was born in 1813. In his fifteenth year he was articled to George Smith. In 1832 he obtained the medal from the Royal Academy for a drawing of the Bank of England. Mr. Brandon entered into partnership with the late T. H. Wyatt. He was elected an associate of the Institute in 1839, and at the time of his death was the senior among the fellows.

A vote of thanks to the representatives of Mr. Brandon was carried with acclamation.

Afterwards a silver bowl was presented to Mr. Arthur Cates, who held the office of chairman of the Board of Examiners during the long period of fourteen years. Mr. Waterhouse, R.A., on behalf of the Board of Examiners, said:—"The work in connection with examinations was serious and full of anxiety. 758 students had passed, and upwards of 1,000 others were

engaged in preparing for the three progressive stages. The students come from all parts of the country. The great task of the examinations undoubtedly was borne by Mr. Cates, who in 1882 was appointed chairman. The scheme for the progressive examinations was elaborated during 1889. It was doubtful whether this work would have met with such success without Mr. Cates's influence. The silver bowl presented was intended as a slight token of sincere regard for their retiring Chairman; the testimonial was made on behalf of the past and present members of the Board of Examiners. The object of the examination was to discover in the candidates, apart from draughtsmanship, some appreciation of what makes a good design, some idea of the fitness of things and a desire to keep the chief end of architecture in view—that of promoting the amenities of human life. In conclusion, he congratulated Mr. Cates on the happy relations that had existed between him and the Board during the years he was with them.

Mr. Cates thanked his colleagues very cordially. The reception they had given to Mr. Waterhouse's remarks would, he said, greatly enhance the value of the testimonial. Students did not fully appreciate the individual labour of the examiners, and the care and time that were given for the advancement of this good work. But the examiners had their reward in the general improvement of architectural education. There was a very great danger in all these education schemes, and other countries had suffered by them, but he hoped England would be free from any bad results. They did not pretend that their examinations would make an architect, but the candidate was enabled to acquire the power to study, and the knowledge obtained in preparing for the examination would become the basis of future studies. Those who were naturally gifted with architectural skill would be greatly aided by them. The great good of the examinations was that of raising the standard of work all over the country.

The inscription on the bowl was, "To Arthur Cates, Esq., for fourteen years Chairman of the Board of Examiners (Architecture) of the Royal Institute of British Architects; from his colleagues, as a mark of their esteem, and in recognition of his untiring zeal in organising and successfully working the examinations, November 1896."

Professor Aitchison then delivered

#### The President's Address to Students.

It has been the custom for the President to say a few words to the students on these occasions. You have had from Mr. MacVicar Anderson, when he was president, some admirable remarks on planning, besides those on professional brotherhood, and most excellent advice from my learned predecessor Mr. Penrose, who found out for us all and the world the optical refinements of Greek architecture. He was trained in the reverent study of the antique from the actual remains of Greek and Roman structures, and is not less learned in those of the middle Italian Renaissance, which he has also measured, and we have heard from him that Palladio alone of the Renaissance architects had learned the secret of the grand Roman style.

However much I may be inferior to my predecessors in weight and eloquence, I think I may say that I cannot yield to them in my ardent desire for the improvement of our English architecture, nor for giving all the advice and all the knowledge that can be imparted in a short speech to the students, in whom we see the future architects of our country.

No teaching will give genius or parts to learners; but I think I may say, without fear of contradiction, that untiring diligence is an absolutely necessary qualification. And this has been so evident to those who possess genius, that Buffon defined it "as the art of taking trouble"—which we all know it is not. But diligence is so absolutely necessary for the development of genius, that it is excusable to confuse the necessary servant with the master.

I would call your attention to the works of Lord Leighton now being exhibited at the Royal Academy, and also to the large collection of his studies at the Gallery of Fine Art, in Bond Street. The studies there are but a portion of the innumerable ones he made, and you will see by these that the exquisite perfection he attained in his finished pictures and statuary resulted from the most careful and accurate study of nature; that there is not a form, an extremity or a piece of drapery that was not perfectly studied before it was painted or modelled.

Necessary as indefatigable diligence is, the longest life is only too short for the attainment of even a competent knowledge in the master art we profess, which embraces so many various arts and requires a knowledge so wide and so various, and qualities of mind that are rarely found in one person. It is a great saving of time to have a map, a compass and a knowledge of the streams and currents of the reefs and sandbanks before we embark; not only to prevent shipwreck, but also to avoid great deviation from our course, so that there may be no waste of labour, however strong and indefatigable we may be. Some of the wisecracks of the last century during a dearth employed labourers to dig holes in the ground and fill

them up again, and although this kept the labourers' muscles in training and prevented the loss of habits of diligence, the crop that should have resulted and rewarded the labourers for their exertions was non-existent; nothing is more disheartening than useless labour. Many of my own early years were wasted in inking-in drawings, and I could not help wishing at the time that I had been a shoemaker, for stitching shoes could not be more irksome and would have prevented some people from getting their feet wet or worn. The creation of something useful would have mentally compensated me for the irksome labour, while no one was benefited by my inking-in drawings.

The wisest saying of the Delphic oracle was, "Know thyself," and it can be as usefully applied to themselves by those who study architecture as by others in the various exigencies of human life. It is obvious that if one knows oneself one can best choose the part of architecture most fitted to one's aptitudes, and one can map out those parts that are essential to be learnt; by this means not only is much useless labour saved, but that worst of all shipwrecks is averted, the having embraced a profession that is not congenial and for which one finds one's capacities are not fitted, and this, too, when it seems too late to throw up the profession. I recollect hearing of a pupil of Laing's—the Laing who built the Custom House—who found architecture so uncongenial that he embraced the law, and became a vice-chancellor; as Alfieri the barrister became a celebrated architect. It is within the knowledge of most men that many of those who have become distinguished have changed their profession, but these men have mostly had a natural aptitude for the subject they eventually embraced and excelled in.

To those unfortunates who have embraced architecture but have no aptitude for it—nor, as far as they know, for anything else—I can only recommend the behaviour of Scotchmen under the circumstances. I think I may say that Scotchmen are the only people of the United Kingdom who have a good education, and by this I mean a moral education. Each man who finds himself in this position says to himself, "This is my only chance in life; I have no natural aptitude for it, but I must try by application and striving in season and out of season to make up for my lack of aptitude," and you rarely find that they fail in whatever walk of life they have embraced, for they mostly gain a good position.

Youth is naturally enthusiastic and ambitious, and would fain know everything connected with its occupation. Most students have probably read Bacon's programme of mastering all human knowledge; but we are not all Bacons, and had Bacon lived now, when the memory wanted for one small branch of science is greater than that given to most men, he would never have set out on so impossible a quest.

A student, for example, has to see what a column or stanchion will safely bear, and so he wants to know the laws of flexure, and finds himself referred to Poisson. He gets Poisson's book, but finds that to understand it he must master the differential calculus; he gets a treatise on that, but finds it would take him his whole life, if he could learn it then. Yet as the multiplication table is to arithmetic, so is the differential calculus to the higher branches of mathematics; he therefore comes to the old conclusion "that everybody cannot do everything."

It is, perhaps, a laudable ambition to take one of the great architectural geniuses as a pattern, but you should have common sense enough to calmly and dispassionately review your own powers and capacities before entering on a serious attempt at imitating his achievements. There is only one genius in several millions of people who is blessed with the capacities of the great architects, who has the making of a Brunellesco, an Alberti, a Peruzzi, a Bramante, a Lionardo, or a Wren, and I only wish more of those who find themselves incompetent would abandon the profession. The average capacity of mankind is not great, and yet each one wishes to be the bright particular star of the world. Each unit of mankind cannot endure the idea that his capacity is not equal to that of the greatest genius; but he will admit that he is deficient in industry, and in that judgment which guides a man to concentrate himself on the principal aim of his life. This shows us one of the weaknesses of humanity, to be ashamed of admitting that which is a pure accident, over which we have no control; and to admit, without blushing, our neglect of those things that are in our power. It is the fashion to encourage the belief that all men are born with equal capacities, as it is to suppose that every epoch is equal in mental and moral power, and that the difference depends on teaching, as if cutting and polishing a flint stone would turn it into a diamond. I recollect Roebuck talking this sort of nonsense at Sheffield, and after pointing out what John Stuart Mill could do at thirteen years of age, who had then mastered Greek, Latin and mathematics, he says, "But if John Mill could do what he described, why may not John Brown do as much, or nearly as much?"

The subjects that seem to me of the utmost importance are—firstly, the recognition by students and their teachers that architecture is a structural art, and that until this is realised

and acted on no great improvement is likely to take place. All the materials we use have weight, and in their ultimate position have size too, and in the positions they are placed have, as well as downright pressure, cross and diagonal strains. All these strains occur in almost every building, and must balance one another, or else the building becomes deformed or ruined, or tumbles down. The theory of the strains that produce equilibrium is called statics. The architect with the keenest observation, the strongest memory, and the greatest experience is a mere child compared with one who is a master of statics and the strength of materials; secondly, we all admit that without proportion buildings and their parts are unsightly, and we endeavour to train the eye to good proportions by studying classical buildings; their proportions, however, mainly give the statical results gained by experience at the time the buildings were erected; if these studies are pursued too long they are apt to make us fall in love with a state of knowledge inferior to that which we now possess.

That friend of our youth, Mr. Ruskin, partially enlightened us on this subject by pointing out the infinite variety of proportions in nature, most of which we find agreeable to the eye, and we now know that what may be called the fundamental proportions depend on the weight to be carried, the strength of the material and its height and size. Statics allow us to go further, for knowing the strains to be borne and where they come, and the strength and peculiarities of the material, we may mould it into various forms, either by cutting away useless parts or by adding to the bulk in certain directions. By statics we know where there is a change of function, and where various strains are concentrated, and these parts call for some expression, and the only way of expressing them architecturally is by moulding.

The proper arrangement of each chamber for the duties it has to perform, the collocation of the different chambers, and the access to them by means of halls or passages without unnecessary waste of room, is commonly denoted by the word "planning," and in reality it includes much more, as, for instance, their proper lighting, aëration, ventilation and warming; in fact, the enabling us to make the different portions fulfil their ends is the foundation of all good architecture. But man wants more than this; he wants not only certain parts to be more striking than others, but to make the whole have such an external appearance that it tells us the use of the building and evokes the emotions proper to its use. All we have to deal with outside are walls and roofs, but we may want porticoes and porches, towers, lanterns, spires and domes for certain uses and under certain circumstances.

Inside we have much the same elements, but we have as well floors, ceilings and staircases, and although we always want floors to be flat, there are circumstances where steps are required to give elevation and dignity to certain parts, and there are also certain shapes which add beauty or dignity to the rooms, and if the ceiling is vaulted or domed we may want it made striking or beautiful.

One particular point is usually missed in speaking of architecture—the skill in combining the junctions between forms of diverse or opposed shapes and of marking the different changes of function where they occur, or of marking the concentration of strains. These, as I have mentioned before, are accomplished by moulding, and these mouldings are to give us varieties of light and shade and to have a sort of logical sequence in their forms. The Greeks were the first and the greatest masters of mouldings, which were, of course, shaped to be played on by brilliant sunshine and in a clear air. The Roman mouldings were only badly-designed Greek ones with infinitely less variation. The second masters of moulding were the Gothic architects, who designed them for the misty climates and feeble sunshine of the countries they lived in. They were as logical as the Greeks, though destitute of their refined artistic sensibilities, and since then the study of profiling has been abandoned.

I say nothing of sculpture, in which I included naturalistic as well as vegetable and animal forms, for this is another art; but it must be exercised with due regard to the architecture, and must neither be incongruous nor destroy the scale of the part, the chamber nor the building. You cannot expect sculpture from architects, as it takes the life study of an artist, and architecture alone may be said to embrace the life studies of many men—men of science, men of ingenuity and men of art. When, however, the architect is so transcendent a genius that he can master his own art and that of another artist, he excites our wonder and our admiration; but to be a bad architect and an execrable sculptor too is not a combination to be admired, and still less to be proud of. It merely entitles the possessor to Martial's compliment, who called the amateur who did so many things nicely a great meddler.

There are one or two more points that I must mention, but perhaps the influence of the age is the most important; this in one direction is what we call the taste of the nation, and it inevitably modifies the individual taste of the artist. The old proverb says, "The mind of man is greedy of novelty," and novelty in itself has, no doubt, a certain charm, but it should

only be that difference from what has gone before which must inevitably follow from those thousands of things, circumstances and temperaments that distinguish one age from another. It shows us, too, how ridiculous antiquarianism is when it takes the place of architecture. We are not Greeks, Romans or Byzantines; our age is not Romanesque, nor Gothic, nor Renaissance, and if the architecture of the day is to charm the age it must discover and embody the desires of the age. The paraphrasing of deceased styles only charms us in so far as our civilisation approaches that of the date of the building paraphrased, and the building wants novelty too. We naturally do not admire Gothic paraphrases, as the desires of those times are so far removed from our own inclinations. The Gothic architect's passion for geometry is very far from being ours.

The nation, too, has lost all desire for art which is the embodiment of ideas by which alone the bulk of the people can be taught; now a little scientific jargon, embodied in a newspaper paragraph, or an Act of Parliament, is expected to fulfil the function of art, but any person of observation can see it does not. Art, which should proclaim to the most uneducated the various inestimable advantages obtained by being free, by having a voice in the election of its representatives, by belonging to a great nation with colonies, by free teaching, by free surgery and doctoring, by free lunatic asylums, by the free housing, clothing and feeding of aged paupers, by free libraries, by public parks, gardens and baths, by free museums and free picture galleries, knows nothing of it, because it is not brought to their eyes by art; in fact, so far is this from being the case that all these benefits, if not unknown, are unnoticed, because art is suppressed in all the buildings which minister to the people's wants. Such buildings should be of the most impressive appearance and adorned with sculpture, expressive of their use. Splendid tombs and monuments in public places should perpetuate the memory of the great warriors and statesmen, the great inventors and industrial leaders, the great poets, the great writers, musical composers, painters, sculptors and architects, whose works will make the nation live in the memory of the world when its greatness and glory have departed.

Architects can but slightly modify the desires of an age, as there are so many thousand things, conditions and influences that combine to mould public taste. All they can do is to have the attainable knowledge and skill required for their art, and if invention in architecture is extinct we must try to recreate it. I hope it is not extinct, but if it be we still have the mountains, rocks and peaks, the caverns and grottoes, the woods, the trees and the plains, the rivers and seas, the clouds and the heavens, to stimulate us to embody the lessons we can learn from these natural effects; not to speak of the lessons we can learn from the past architectures of the world. I cannot help thinking that if the born architect should arise and be single-eyed in his devotion to this grand art, we might hope to see it again flourishing, as in the grand epochs of the past. Antiquarianism is not content with gnawing out the vitals of architecture, but is destroying our faith in its being still alive.

Another of the points that wants attending to is the study of the means employed by the great architects of the world to evoke the emotions proper to the use of buildings, and particularly to those dedicated to the adoration of the Almighty. Students are naturally apt to seize upon features that they admire and use them in the most incongruous way, as if the adornment of a temple or a palace were appropriate to a labourer's cottage, a coal store, or to a tailor's shop, whose owner makes the human form divine, ludicrous and ignoble. Elegant simplicity of appearance should be the architect's aim for most of his buildings, as his aim should be to produce horror and repulsion in a prison.

Our great object now is to be sure that we have done our best to learn all that we ought to learn. How delightful would it be if we were as sure of our progress as were the Gothic architects, and instead of being as careful of every scrap left by a semi-barbarous age as if it had come from heaven and were sacred, we could use with a light heart a good stone as they did for our own work and build in their worked part we have surpassed. I may say this was not confined to Gothic days; the Greeks used the sculpture they had surpassed for filling in holes and trenches, and Mr. Purdon Clarke showed me a Saracen wood block that had once formed a door-head in a destroyed mosque, the back of which had been used for the work of the day, while the carved part, worked in a former age, had been built in.

If the Institute wants to start this work of fundamental improvement it will see that its examinations are not confined to students alone, but are to be passed by every one who joins it, and that everything that is not architectural is excluded from the examinations, and that those things alone are included that every architect ought to know to be worthy of the name. No one can say that the arts of surgery and medicine have not enormously advanced since the surgeons and doctors had to pass a strict examination in the subjects of these arts. No sane person can suppose that if architects were required to show

that their knowledge rested on a solid foundation of science and æsthetics that architecture would not rapidly progress.

**Review of the Designs and Drawings submitted for Prizes and Studentships 1897.**

By WILLIAM MILNER FAWCETT, M.A. Cantab., Vice-President.

It was with no small surprise that I was asked by the Council to speak to you about the drawings submitted in competition for the various prizes offered by the Institute. In some respects I must differ with the Council as to my being a very fit person for the office, as I have never had any experience in former years. Though I may have seen the drawings occasionally, I have never taken any part in awarding prizes, so that I can offer no criticism on the comparative excellence of those I have seen and those of former years. So long, however, as I give you fair and just criticism on these now submitted we can perhaps all allow those of past years for once to remain in oblivion.

The Council in awarding prizes do not enter into the question of the good qualities or faults of any beyond the simple award of prizes to those they think to be the best. This award is almost necessarily given without assigning reasons, and therefore it is found better for some other hand to give praise or blame as he may think either deserved.

There are many drawings here which show great care and much labour, and I trust that wherever I may find fault, as I must do where I see fault, the stricture will be taken in the spirit in which I give it, and that my desire to make the work the more full of profit to the worker may result in the more careful consideration of the principles of construction, arrangement, or design when future attempts are made, whether they be merely in running for a prize, or in the harder race of life, when the work has to be put to the more serious test of being carried out in actual bricks and mortar.

Without further preface I will now make my review of the drawings submitted.

The chief prize for which competition is asked is undoubtedly the Soane Medallion, and the roof which accompanies it. Soane was chiefly interested in Classic work, and I believe that the Council have nearly always been particular to give subjects which could well be worked out on Classic lines. The "Market Hall," given this time, has met with but little Classic response; but as no rule is laid down on the subject, and students are left to their own feelings, it is not surprising that the numerous examples of quaint old Medieval and later work have brought ideas to the mind, and dispelled the visions of really early Classic work.

In the design "Li-Lu" we have an open market on the ground floor, with assembly-room above. This is the arrangement that has found favour almost without exception.

The competitor here has put a house for the hall-keeper partly below ground, which is certainly not an ideal arrangement, even though under stern necessity such things have to be done sometimes. In design the "Clock Tower" is poor, and the turrets are non-effective, but there is a fair mass which ought to come out well in execution.

The design under motto "L'Eléphant d'Argent" has a good feature in the raised platform with four steps, and the inclined roadways will take light carts. The staircase implies that the open market-place has more room than is wanted for the size of the town. The entrance to the assembly-room is close to the platform, which is a fatal arrangement as far as filling the room is concerned. The elevation is very simple, and made under the evident intention of having a mass of plane surface to give greater value to the band of figures in relief. The idea is carried rather far. The spirited drawing brings them out, but the figures might hardly hold their own in execution.

In the design "Artifex" the assembly-room finds no favour, but there are two markets. An arrangement quite as legitimate as the more usual one, but sanitary arrangements are forgotten altogether. The elevations have a certain delicacy, but the towers crowd up the end elevations. The flèche is too fussy to be happy, and the section shows no construction for it.

It may be well to mention that the competitor under the motto "Neath Southern Skies" is an Australian, who, I am told, has lived all his life in Australia, and thus has had no advantages in the way of seeing ancient buildings and feeling the poetry with which they abound. The design submitted is very bold and has great merit. It is certainly hard to say what style it is supposed to be in, but that is a feature one would naturally expect under the circumstances, and I trust we are not so tied to precedent that we need condemn it as a fault. The bold arches on the ground floor are certainly effective. The corbelled corridor wall with its coving is somewhat heavy, and I fear the provincial market town that adopts the design will feel the increased rates for some time.

The design "Labor ipse Voluptas" has a well-arranged plan. The principal staircase is the chief blot, as it is far too small and steep for such a room as is provided. The piers between the windows have all they can do to resist the thrust of the open timber roof. The elevations are quiet and have

good feeling, and the design gives promise that the author may be able to execute really good work.

The device "Shell and Ribbon" is given to a very Dutch design. Everything seems sacrificed to a turret far out of proportion. When one sees four posts in the middle of the assembly-room, with numerous braces, all big enough to be very inconvenient but hardly sufficient to carry the turret, one feels that it is a design for a turret with a market hall attached to it, and the author evidently thinks that a turret with its clock and bell requires but little sanitary arrangement. In spite of all these faults there is a very good feeling in some parts of the design.

In the design with motto "Russet" the plan is well arranged, and details have been carefully thought out. The elevation has considerable dignity, and it is quiet and simple, but the heavy key-stones and projecting voisseurs to the windows, &c., are somewhat overdone. Taken as a whole, it shows that the author has considerable power, which I hope the studentship will help to enable him to bring to good effect.

"Charley's Aunt" is, I suppose, a joke in design as well as in motto.

The design "Oxonian" has managed a market clear of columns, and his plans are well thought out. He has probably altered as he went on, as section and plan do not quite agree. He could not manage the window shown in section as the plan is now arranged, and the door is needed. The piers between the windows are not too strong for the open timber roof. The elevations are simple and effective, but the entasis of the pilasters are a little overdone.

"Briton" makes a variety in treatment, as he devotes his ground floor to shops, none of which have any retiring-room or other conveniences, and he places his market above. There are many disadvantages in such an arrangement, which a lift for heavy goods does not by any means remove. There is some thought in his elevations, which are decidedly severe.

The design with motto "North Wind" has many good points. The elevations are perhaps too much cut up, but the whole is fairly grouped. It cannot compare though, as a whole, with several others.

The design "Bon Espoir" has a well-thought-out plan in many respects. The half-timbered walling has good effect, but is drawn without fully thinking of sizes of timber. The wall in plan is evidently solid brick or stone, so the half-timber is somewhat of a sham. The design, though, in many points shows that it has had considerable thought.

The design "Bumble" is somewhat overweighted by the towers at the angles. The two small staircases to the upper room can hardly be considered of the same value as one double the size of either. All dignity of approach is lost, and there is double attendance required, not to mention other inconveniences. However desirable a second entrance may be, there should at least be one good one.

The design "St. Clements" is well thought out, and has many good points. It is the only one which has carried out a really dignified entrance to the hall on the first floor. The details of plan are well thought out, and the elevations are simple and well designed, and have a very pleasing quaintness about them. I trust he will venture to try his fortune another year.

*The Tite Prize.*

The Tite Prize has this year drawn but few competitors. The two who have sent in cannot be said to have shown all the care that is necessary. The design with a ☉ can hardly be called a villa, it is a large mansion; and the designer of "Gondola" has not thought it necessary to provide for some of the main essentials of every house.

*The Grissell Competition.*

The Grissell Competition has drawn seven designs. The subject is a bay of a church. It is a subject which requires any one who attempts it really to have made a study from many churches before he can hope to design anything of value, and this can hardly be said to be the case with either "Equilibrium" or "Zeal." "Goth" has more good points, but it is too florid, and the construction is weak.

The design with "Heart and Shield" device is decidedly original, and is very delicately drawn. Personally, I should have preferred it if set out in a bolder manner. It would undoubtedly make a very striking building. The side shrine chapels are perhaps a little low, but they are well sheltered, so that devotion need be but little disturbed. The foliage to capitals is original and somewhat eccentric. The building would be a very striking one if of sufficient length, which we are entitled to presume it would be.

There is great merit in the design , but it has

the fault that the flying buttress is placed too high to be of full value. There is a great deal of very careful work.

The same may also be said for "Pheon," which is also well worked out, and in an earlier style. The flying buttress has the same fault, but there is great merit in both these sets of drawings.

It is hard to say much more about the remaining design, "Middle Ages." It is, perhaps, hardly equal to the last two, but has so much merit and so much careful thought that it is invidious to say anything that might be interpreted with mere fault-finding.

All the prizes and studentships which I have spoken of above are for original design, and although I may have let my criticisms, perhaps, fall a little into fault-finding, I cannot pass to other work without supplementing these detailed remarks with the more general statement of my pleasure at seeing such a vast amount of really good work submitted for the prizes. There is a great deal of good design well thought out and well expressed. It is my duty to turn to another class of work, namely, that showing the study of old work. I need not dilate here on the necessity for this study—we are all agreed on it.

#### *Owen Jones Studentship.*

The Owen Jones Studentship, founded particularly for the study of "Ornament and Coloured Decoration," is, perhaps, the most advanced of these. Only two sets of work have been submitted, and both these show an amount of study and application which well deserve the encouragement of a prize.

Mr. Henderson has been fortunate enough to carry off the studentship. His sketches of detailed ornament, as well as those of more general interior work, show great care. He has been to the sunny south for his examples, and has made good use of his time. The prize will, I hope, enable him to strengthen himself in the work of colour, in which he seems to delight.

Mr. Griffith has also sent in good work. Much of this is home work, and students should not forget the treasures of colour that are to be found throughout our own native land. We are all much behind our fathers in our knowledge of power in the application of colour, and home examples are more likely to prove of real value for use in our own work.

It is a matter on which we must all be glad to congratulate him, that the Council have seen their way to award him the Aldwinckle Prize. Mr. Griffith will now have good opportunity of comparing the tone of colour under the brilliant skies of Spain with those under the quiet grey skies we commonly find at home.

#### *Measured Drawing Competition.*

The competition for the prize for measured drawings has produced three sets of drawings. Two of these competitors have taken St. Mary-le-Strand and the third Melrose Abbey. The two first have chosen a subject that appeals to nearly every one as one of the most beautiful of the churches in London, and both students will have gained a good deal by their work, though they have not gained the prize. The drawing with motto "St. Mary" I should take to be the more accurate of the two, but both are well drawn, not only with care and delicacy, but also with great spirit.

The Melrose Abbey is a fine piece of work, and the larger scale drawing of the south transept is done with a strength of line and vigour of execution that shows the energy of the draughtsman. The larger scale foliage is also given with remarkable vigour. If I may make a deprecatory remark on such a set of drawings, it is with regard to a not uncommon fault in the smaller scale drawings of young draughtsmen. In setting out tracery, &c., the fact has not been calculated that the thickness of the outline counts to the tracery while all is clear, but it counts to the shaded part when the spaces are darkened, so that the tracery is made to appear thinner and weaker than it is. This, however, is a minor fault which does not lead to any great misapprehension, and I mention it as one on which young men are often tripped up on setting out work of this kind.

#### *Pugin Studentship.*

There are eight sets of very good drawings for this prize, and it is somewhat hard to make invidious comparisons among them.

Mr. Dobson has made careful studies at Lincoln and Beverley and Ely, besides minor sketches in other places.

Mr. Hoare has spent more time abroad, but has wandered over England from Hexham to Canterbury, and his work will leave many pleasant impressions on his mind; but he is more sketchy than the last named.

Mr. Sheppard has worked chiefly at Worcester, and his work takes more of the careful study of measured work. His pencil is not nearly so free, but freedom of hand is only gained by practice.

Mr. Swan's work is of great merit. He has not only some good measured work at Ypres and Ghent, which are particularly worthy of attention, but shows a fair facility with his pencil.

Mr. Collins's work is also remarkably good. His examples are chiefly taken from the South of England, and his sketches of churches are full of vigour.

Mr. Gruchy has worked chiefly in Yorkshire—at Beverley, Howden, Hedon and York, and he has also ventured south to St. Albans. The measured work is decidedly good. His sketches also show a great delicacy of touch; but they show signs of not having being done in the field, but touched up when he got home, or perhaps drawn out afresh. The effect is that of having drawn more than could really be seen, and it is work of the class that caused the remark—I believe of Mr. Ruskin—that architects could not draw architecture, as they invariably put in detail they know to be there, but which could not be clear to the non-professional eye. The St. Albans work has been a work certainly of labour, and I trust of love also.

Mr. Brooks has worked chiefly on sketches, and has given us some fairly good drawing, but his powers will develop with more practice.

Mr. Haywood's set of drawings is really charming. The care in setting out measured work is only equalled by the power of delineating it. There is little of field sketching, but it is the real accuracy of work which is the most necessary thing to study. His power of drawing is shown in his figure work. May he not only enjoy but profit by his well-earned studentship.

In looking over the large amount of work which has been undertaken for the chance of the prizes, most of which involve an undertaking to prosecute studies still further, one cannot help feeling for the disappointment of the many who receive here nothing but a word or two of praise, or perhaps of blame. To them there may be the feeling of inquiry as to what good they have got for their labours. I trust that they have had sufficient interest in their work not to feel depressed because others have taken the prizes. Though I do not consider myself an old man, I am old enough to have noticed that the men who succeed best in their professions, whether lawyers, doctors, chemists or men of other classes of science or literature, are those who take a real pleasure in their work, who seem never to find it irksome, but seem often to do it for the fascination they find in it. I feel sure it is more so with those who take up art as a profession, whether it be painting, sculpture or the branch we are practising ourselves.

The thought and study which you have given to your work has, I feel sure, been of great benefit to you, and I hope it has been a pleasure also, and that you can all join one of your brother competitors in his motto and say from your heart, "Labor ipse Voluptas."

## LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

AT a meeting of the members of this Society held on Monday evening, Mr. Arthur Stratton read an interesting paper on "Sir Christopher Wren and his Work." Born in 1630, Christopher Wren lived during the turbulent period of the Commonwealth. After taking full University degrees, he was induced, as the result chiefly of the great London fire of 1666, to turn his attention to architecture, though his studies had been arranged to fit him as an astronomer. How this diversion of his talents into the channel of architecture resulted is recorded in the annals of fame. The task that was early placed in his hands was a gigantic one; it was to rebuild St. Paul's Cathedral and about fifty London churches. For the performance of his huge work he received the stipend—a mere pittance—of 200*l.* per annum. The rebuilding of St. Paul's occupied nearly fifty years, the foundation-stone being laid in 1675 and the structure completed in 1723. Though his work was largely modelled on the Italian masters, yet, strange to say, Sir Christopher Wren never visited Italy. He worked with the highest motives with which an architect can be imbued; the ennoblement of the art to which he contributed so much was the object of his aspirations and the aim of his labours. His career closed in 1723, when he died at the age of ninety-five years. The lecture was illustrated by a number of excellent slides. Mr. W. Watson (president of the Society) occupied the chair.

The Palace Yard, Earl Street, Coventry, has been purchased by Alderman Singer and other gentlemen, and is believed to be destined ultimately to be converted to some public object. The site, which is partially covered by quaint old timbered buildings, comprises about 2,800 square yards. It has been the hostelry of several royal visitors, particularly in the seventeenth century. In September 1687 James II. was entertained there by Richard Hopkins, a citizen. In December 1688 Princess Ann of Denmark lodged there. In 1689 Mr. Hopkins was elected a member for the city, and in the following year Prince George of Denmark was his guest. The buildings have of recent years been used as builders' premises and as offices and warehouses. They adjoin the Technical Institute and front the site of the proposed new municipal buildings.

## NOTES AND COMMENTS.

WE lately described the imbroglio at Lille which is caused by the defects of the new Palais des Beaux-Arts. The pictures and drawings, which are about the most valuable of all those in the French provincial *musées*, have become deteriorated, partly owing to the humidity of the building and partly to the excessive heat employed as a remedy for the evil. A contest arose between the Municipal Council, the committee of the Musée and the Administration of Fine Arts, each body endeavouring to cast the responsibility on the others. Eventually the Administration menaced Lille with a resolution to remove all the works of art from it to some other town where more care would be taken of them. The effect is that specifications have been prepared for alterations in the buildings by which the interior will become less subjected to atmospheric influences. The estimated cost is 122,271 francs, or nearly 5,000*l.*, which is a large sum to pay to remedy the defects of a building which had to be closed to the public almost as soon as it was opened.

ONCE more there is a rumour that Signor GIANTURCO, the Italian Minister of Education and the Arts, has been able to negotiate with Prince PAUL BORGHESE for the acquisition of the pictures in the Palazzo Borghese by the Italian Government. The Borghese family, it is said, were induced to expend enormous sums in building speculations which were not profitable, and it is necessary to find an equivalent for them. Some of the famous pictures had to be sold and others were destined to follow them out of Italy when the law against the exportation of such property was enforced. In Rome there is no collection that is comparable with the contents of the eleven galleries of the Borghese Palace, and the wealthiest connoisseurs of Europe and America would be glad to compete for pictures one of which would be enough to gain position for its owner. To possess TITIAN'S *Amor sacro et Amor profano* or RAPHAEL'S *Deposition*, CORREGGIO'S *Danae* or DOMENICHINO'S *Nymphs* would be almost equal to gaining a knighthood, while Rome itself would be poorer if they were dispersed.

FEW men were more deserving of the gratitude of painters—if such a virtue can exist—than the late M. BORNICHE, the Paris wood merchant. "Little Blue Mantle" was an agent of a charity organisation society in comparison with him. For M. BORNICHE was for years the chief consolation of the numerous artists who have failed to persuade Salon juries to grant admission to their works. When he departed to a world where so much generosity was, we trust, rewarded, he possessed about 24,000 examples of the nineteenth-century art of France. They had not grown more valuable by his ownership. Four thousand which appeared most promising were valued at 120,000 francs, or 30 francs apiece, and found purchasers on still lower terms. The 20,000 forming the residuum can, it is said, be secured by any one who is willing to invest 36,000 francs, or less than 2 francs per picture. Whatever may be their artistic or financial value, the paintings were like a Mascotte—they brought wealth. M. BORNICHE'S daughter, although eccentric, was able to leave 5,000,000 francs for the erection of a woman's hospital on her estate.

APPARENTLY it is more difficult to accomplish an impartial selection of competitive designs in America than in England, although the aid of a professional assessor is invoked. This conclusion can be drawn from the competition for the Passaic Courthouse in Paterson, New Jersey, which recalls the competition for the Belfast Municipal Buildings in some of the circumstances. The terms offered were unusual. The author of the best design was to be entrusted with the work, and the authors of the five next best designs were to receive 300 dollars each. Professor WARE, of Columbia, was selected as professional adviser, the drawings were to be sent to him, and he was to select twelve, leaving the final choice to the commission. Forty-eight sets were sent in. Professor WARE, after a fortnight's examination, selected twelve, which he despatched to the commission, with a detailed report on each of them. Three were specially commended by him. After

a few days, Professor WARE was asked to forward the remaining plans also, on the ground that as some of them were by local architects it would be advantageous to be able to say they were examined by the commission. After three months' consideration it was announced that among the twelve plans selected by Professor WARE there was not one which was considered suitable by the commission. Out of the remaining thirty-six the commission selected six, and prizes were awarded to the authors of them. Professor WARE'S chosen architects are naturally indignant at the loss of the anticipated rewards. But it appears to us that when twelve designs were to be recommended, the final choice was to be left to the commission. When latitude of that kind is permitted, there is a difficulty in fixing limits to the extension, and the assessor ceases to be a safeguard. An action against the commission is threatened, and it would be an advantage to have a judicial statement of the law on a subject which is likely to have interest for many American architects.

THE state of the French finances is indicated by the scaffolding which has been so many years allowed to remain around public buildings because no money is available to carry out the works which were contemplated. The Sainte Chapelle was so long concealed that many Parisians could not realise the appearance of the exterior of the building. Some years ago it was discovered that the statues which adorned the upper part of the second court of the Palais-Royal were in danger of falling, and it was decided to repair them, for as the works of PAGOU and GÉRARD they are worth preservation. Apparently there is no money to pay for cement, and in consequence the timbers are decaying. The part remaining of the old Sorbonne was only enclosed by scaffolding a year ago, and therefore it is perhaps unreasonable to expect the restoration should be commenced, and we suppose timber is so cheap there is not much advantage in expedition. Moreover, by delay the work required for restoration is increased in quantity, and the Paris workman will be less discontented. How the public must wish for a visit to the betimbered buildings by some foreign potentate. The Czar caused the removal of the scaffolding from the Arc de Triomphe, and it may be the fate of the Kaiser to free the Sorbonne from its encumbrances.

ALTHOUGH Geneva was for many a year a sanctuary of freedom and sometimes the only one available in Europe, the authorities of the city can occasionally be rather arbitrary in their operations. The proposal to use one of the open spaces—la Plaine de Plainpalais—as a site for a new musée is one instance which does not show much respect for the rights of the present or future citizens. The subject was brought before a meeting of the Society of Arts of Geneva by Mr. LAWRENCE HARVEY, architect. He explained how in England a similar proposal could not be carried out without the authority of a special Act of Parliament, and that among us it was more common to increase the number of open spaces than to diminish them. There is no doubt a new musée is needed in Geneva. But Mr. HARVEY demonstrated the possibility of obtaining the required accommodation by a transformation of the Bâtiment Electoral, and he presented plans which he had prepared showing the proposed alterations. The work upon the building he estimated would cost 780,000 francs, exclusive of decoration. Mr. HARVEY considered it would be preferable to allow a period of half a century for the decoration in order that several eminent artists might share in the work. There was a long discussion and it was finally suggested that the Bâtiment Electoral should be demolished and replaced by a musée. Mr. HARVEY'S interference is therefore like to save "la Plaine" for the people of Geneva.

## LINCOLN CATHEDRAL.—IV.

WE publish this week a plan and other illustrations of Lincoln Cathedral. The plan, it will be observed, is somewhat unusual, and was a departure from that of the Cathedral of Remigius. The double transepts have their advantages, but do not seem to have any special symbolism. A few years ago Mr. A. B. Pite, the president of the Architectural Association, read a paper on the subject of "Cathedral Planning," in which he contrasted the arrangements at Lincoln with those of some other English cathedrals. We reprint the following extract from it:—

English architects seem to have grasped with a firm hand the artistic qualities of the cruciform plan. Lincoln Cathedral is an example, and perhaps it might be difficult to find one more complete in itself or more typical of our national peculiarities. As a mere ground-plan it is a work of fine art, well-proportioned and interesting, with beautiful forms employed about it. The foot of the cross is sufficiently deep to balance its great length, being formed by the two western towers and transepts. These latter are of little or no use to the

nave as transepts; both are closely screened off, and used for the independent purposes of a morning chapel and a consistory court. They have still less to do with the elevation, being only of the same height as the side aisles; but they have a distinct architectural value on plan. The nave has seven bays, the two westernmost being narrower than the others, originally without doubt because it was built from the choir to meet the older Norman work of the front. The Norman nave, as seen between the towers, was narrower than the present one. But these two narrower western bays bring the transept vaults, of equivalent width, into harmony and connection with the side aisles, and are beautiful specimens of groining. The dimension of these two nave bays governs the projection of the transepts, which we feel to be the just one, as it has base enough to balance without rivalling the great crossing. If we were dealing with a cross in upright elevation, the base would bring the cross on to the ground-line, which carries the eye away beyond the projection of the arms. The screens which divide the nave from the chapel and consistory court are original work, not later additions. Notice their value to the whole plan. They carry the nave at its normal width past the transept, till it butts against

the towers. Though the transepts only effect a junction with the side-aisle vaults, and do not pass the main arcade, the nave would have been shortened and its proportion to the whole lost, besides the creation of a western rival to the great transepts, had these low stone screen walls been omitted from the plan. For the sake, therefore, of its hidden beauty, and also for that of the architect, who brought the older building into union with his with such consummate skill as to make a perfectly-pro-

portioned plan out of two incongruous parts, we trust that these screens may yet long escape the hands of the "unbroken vista" lovers. Before leaving the west end, observe how artistically the octagonal turrets turn the corners of the front. They are poised in an unusual way, having but little projection on the front and considerable at the sides and back. This may be merely because the front pre-existed of a fixed width, which did not agree with the dimension that governs the western transepts.

In all probability, one of ourselves—a modern architect—would have made our transepts extend just a trifle more, so that the pinnacles should stand at the exact angle of the building, but then the valuable “claw” they exercise on the plan would have been lost. As they stand they furnish fixed points from which we can comprehend the scheme of the base.

Peterborough has a small plan with a simple outline, as there is distinctly no feature to interrupt the cross. It is in this

simple completeness unique, and contrasts remarkably with the plan of Lincoln. Its proportion as a whole is good. If there is a fault, it is that the upper part of the cross is a trifle too long. Half the width of a bay of the lady chapel might be spared. In nearly all English plans, whatever may have been the original length determined on, subsequent alterations have pushed the building eastwards, generally with the happiest effects, as this otherwise inordinate extension of the upper part

Photographed by S. B. Bolas & Co.

LINCOLN CATHEDRAL, WEST FRONT.

was made proportionate by such successful expedients as choir transepts, or by a diminution of width in the presbytery, or by a more considerable one in the lady chapel beyond; also by the accentuation of the main crossing, with the same purpose in view as at Ely and Winchester. The western transepts, which form the *raison d'être* of the Peterborough façade, are like those of Lincoln in one respect, being of little projection in proportion to their depth, their dimensions being the width of the side aisles. They are divided from north to south by the wall which gives recess to the front, and produces a marked effect on plan. It reduces the western transepts to a width which makes them a base or plinth to the cross. At Lincoln the base to the cross is formed by the square subdivided masses of the towers; the western transepts counterpoising the greater transepts with the entire length of the church, the screen walls purposely preventing the foot or plinth of the cross from being realised in order to preserve the effect of the nave. The Peterborough nave is long enough, and the transepts consequently can become not merely an external counterpoise to the other masses of the building, and be partly absorbed by the nave, but have a definite relation to the idea of the cross at its foot. The total depth is just as necessary to the whole, and what is superfluous to the plinth is cut off by the cross wall, and becomes the glorious recessing to the arches of the façade. This is the secret of the mystery of the front. Anything but a hollow sham having no relation to the whole, it is, in fact, the result of a masterly and beautiful plan. The towers which bound the front are delicately and subtly stepped forward with almost the effect of a curve, and form the lower feet from which the cross rises firmly and gracefully, the broad splaying of the arches and the recesses behind aiding this impression. The later porch which projects beyond is fortunately cut off on plan by the recesses. Peterborough is the only cathedral plan I know that can be looked at in upright elevation with entirely satisfactory results.

Salisbury, though on a smaller scale, is a plan of similar proportions and scheme to Lincoln, but without the western transepts. It was built a short time after the nave of Lincoln, in 1220. It is a double cross having transepts of the same relative projection, and there is but little difference in the proportionate lengths of the choir and presbytery. The scheme of the cloister and chapter-house is also similar, but they are in a position which the exigencies of the site did not permit at Lincoln on the south side of the nave, the more usual position. To a certain extent perhaps this position may give a finish or balance to the western end of the cathedral on the south side, but something seems needed on the north. The porch would scarcely supply the need or be important enough for the position. The length of the nave without being interrupted needs the balance and base that the western transepts give to Lincoln. A comparison between the two cathedrals in these particulars is the more justifiable, as both the west fronts are designed on the same principle, being façades, distinct architectural compositions complete in themselves, with corresponding turrets at the ends. These turrets are not pitched on the intersection of the front and side on the "correct angle," but are placed as terminations to the front, though they have not enough projection in spite of this on the plan to furnish us with the points that the Lincoln turrets give, and we consequently miss its completeness and beauty in this respect. A visitor to Salisbury feels there is a lack of interest at the further end of the nave, especially after turning from the choir; it seems too long a walk. It cannot be that the architect was unwise enough to design that this impression should be produced to increase the effect of his west front *tour de force* awaiting one beyond the welcome door. It must be remembered in criticising Salisbury that it is practically the work of a single mind and generation, being one complete erection, at all events as far as the plan goes. This is scarcely the case with any other of our Mediæval cathedrals.

Winchester has a small lady chapel terminating the east end, like Salisbury, but has only one grand transept and no projections at the west end. It does not seem to feel the lack appreciably, as one fears, that the interesting proportions of the chancel should be damaged. At Salisbury the double transepts brought the projection along the body of the plan in a swelling gradation. The east end of Winchester is sufficiently removed from the great transepts to be independent of them and complete in itself, and in its relation to the entire length of the plan.

Durham has a burly massiveness in plan, true to the character of other aspects of the building. The so-called chapel of the nine altars (I cannot but think it should be seven) crowns the cruciform, as one did once at Lincoln and Fountains, in a complete and final manner, but subservient to the central transepts. The nave is finished by the slight projection of the western towers, that seems the exact amount required to balance the whole without disturbing the mass of the east end.

Ely as a whole is simpler in outline than any we have been considering, though we bear in mind the extraordinary feats of constructive skill and beautiful design wrapped up in it. The nave, choir and presbytery are unusually long and wide, but

well balanced by the great transepts, comparatively short in projection. The design of the west end is unique—narrow but massive transepts, with a small apsidal chapel nestling against the south side of the nave. I am inclined to think that the design contemplated a corresponding chapel on the northern side. This little chapel gives the transept depth enough to balance the plan, and, being low, plays no prominent part externally. The chapel has here exactly the same object to attain as the screen walls at Lincoln. Though the two plans are different in almost every particular of design, we see that the architect had the same result to attain and succeeded by a different method in each case. Five turrets nearly circular on plan complete in a magnificent manner the design of the transepts and make Ely an interesting example of western transept planning. The Galilee porch interferes slightly with the happy result, owing to the great thickness of its walls necessitated for abutments to the arches that carry the central western tower. This was not the case with the Galilee at Durham, as the walls were not too thick to look delicate on plan.

Leaving strictly English examples, Westminster, in spite of its general tendency to depart from national types, is English in having a plan that is complete and beautiful as a whole, the base of the western towers having enough projection to make a satisfactory termination to the nave. Sir Christopher Wren's plan of St. Paul's has western transepts which are not quite happy in proportion. They seem either too large or too small, too large and deep for the length of the nave, and not far enough for the great transepts to aid their proportion. The nave could not well have been lengthened, as its huge arches would lose scale by further repetition. The western transepts seem too small when we realise that if they had been equal in size to the great arms of the cross the nave would have been perfectly balanced, though this would have been a departure from the proper cruciform plan. We find this carried out in the plan of Minster Cathedral, a building, though small in comparison with St. Paul's, more huge in scale. The nave consists of two spans. The eastern and western transepts are the same in size, have but little projection, and are of the same width as the nave. Their size, however, does not interfere with the latter, which passes through the eastern crossing into the chevet and through the western for an equal distance to a porch. In the examples as yet referred to the western transepts have been connected with the façade, but at Minster they have no relation to such, the front being a gable between two simple square towers.

The cruciform plan produced long churches, as the crossing arms divided the length and gave interest to points in what, without them, would have been a mere corridor. Our architects who were content to trust themselves to the cruciform plan for a supply of sufficient interest and beauty, naturally found at the crossing the centre and most important part of the design. This is why they concentrated their powers on the design of those lantern towers which are the glory of our cities and ours alone. Their thoroughness in adhering to a definite scheme of plan has been amply rewarded. The continental architects, who either did not perceive the vantage point they possessed at the crossing or were careless of it, produced no cathedrals which can rival the English in beauty and dignity of grouping. The fact that the square east end was the rule of our English practice has not a little to do with the emphasis given to the crossing; being conscious that the building could be terminated at any point to meet whatever proportion already existed, the transepts were lengthened and widened to group externally with the lofty tower and give space and effect to the interior. The transepts, as a consequence, are much more important and valuable here than abroad, their repetition beyond the choir being most fruitful of artistic results. Both at Lincoln and Salisbury the choir transepts are of beautiful proportions, narrower and of less projection than the great transepts, and seem based on a cross of which the choir forms the stem and the sacrum the head, their point of crossing being the top of the main cross, of which the other transepts are the arms, forming a cross within a cross, and yet maintaining their share in the whole plan. They effect a junction with the main vault, unlike their western brethren, the continuity of which is, however, undisturbed. Having been brought by their means now to the east end, we cannot but feel that there is no other possibly successful termination for the cathedral but a square wall, the rectangle having been the foundation of all the beauties we have been enjoying. And we have reason to be proud of the self-restraint our architects displayed in their way, and wonder what posterity will find of that quality in our own work.

---

**A Monumental Column** is to be erected in Tournay to the French soldiers who were slain at the siege of Antwerp in 1832. Out of the fourteen designs sent in for competition, one by M. Sonnevile, architect, Tournay, was accepted. The sculpture, which comprises a statue of Belgium, will be the work of M. Debort.

## PATHOLOGICAL AND PHYSIOLOGICAL LABORATORIES, BELFAST.

**T**HE building containing the new pathological and physiological laboratories, Queen's College, Belfast, just finished, and which is complete in itself, is devoted entirely to the purposes of research and teaching.

The chemical section is in another block, and consists of two floors or storeys, the ground floor being devoted to qualitative and quantitative laboratories, private laboratory, professor's-room and balance-room. On the upper floor are the practice classrooms, cloak-rooms, combustion chamber and room for gas and water analysis.

The laboratories are fully equipped with water-supply and waste, gas for lighting and experimental purposes; sink chamber and fume closets are connected with extract flues leading to the exhaust tower at the rear of the building. The various rooms are ventilated independently through the roof and walls and thoroughly heated by hot-water pipes from boilers in the basement.

The space at present intervening between the chemical laboratories and the recently-erected physiological laboratories will, in the near future, be occupied by the chemical lecture theatre, occupying the full height of the building, with professor's retiring-room, stores, &c. This will complete the whole range of buildings, and form a handsome and effective group.

*The Physiological Laboratories.*—The recently completed physiological department comprises (1) a large practical classroom, size 47 feet by 37 feet, which for the present is also used as a lecture-room. This room is provided with six work-benches, each capable of accommodating eight workers. Additional space is also provided in the shape of a side bench capable of seating eight additional students. This also serves as a demonstration bench for the exhibition of typical histological slides under the microscope and for other purposes. All the benches are supplied with water, gas, and sinks placed between each pair of workers. A lecturer's bench, elevated 18 inches, is placed at one end of the room, also fitted with water and gas. Three of the front students' benches have been fitted with shafting. Each shaft carries four pulleys for driving students' recording drums. Twelve of these drums are in use. The bench shafts are driven from a shaft beneath the flooring by means of half-twist belts. This latter shaft runs along at the ends of the benches, and is driven by a Thirlmere water-motor placed beneath the side bench.

From the same underground shaft, by means of a guide-pulley, a small shaft on the lecturer's bench is also driven, giving the same motions as those on the students' benches, and in addition a slower rate of motion, which by means of a crank at one end of the shaft is used to work the bellows of an artificial respirator.

Behind the lecturer's bench are placed diagram screens capable of being lowered by cords running over pulleys, and also a ground-glass blackboard. This latter is inclined forwards at the upper part to the extent of 4 inches out of the perpendicular, an arrangement which is found very convenient both for the lecturer as well as for the students in the matter of greater ease with which diagrams can be seen from the seats, which are placed at a lower level than the board.

Two small draught closets, one on each side, are found very convenient. A frog tank and large sink are placed one at either end of the room. A lantern screen is also provided at the right end of the professor's bench. The room is well lighted by three large windows on either side provided with dark blinds for use when the lantern is employed. The heating and ventilation has been fully provided for; both have been found most satisfactory.

2. A small laboratory for physiological chemistry, which is also used at present as a preparation-room. This is fitted with chemical benches for the accommodation of eight senior or sixteen junior students. A side bench covered with a slate slab is supplied with (1) a Soxhlet's fat extraction apparatus capable of doing eight extractions simultaneously; (2) two Kjeldahl distilling apparatus, each for four distillations; (3) a paraffin bath is also placed temporarily in this room. In addition a large stink-chamber is placed at one corner, provided amongst other things with a stand capable of boiling eight Kjeldahl destruction-flasks at one time. A Watson and Laidlaw's centrifuge, supported on a stout stand, is also fitted up in this room.

3. A professor's private room and apparatus-room containing wall-cases for storing physiological apparatus, diagram cases, and also fitted with two work-benches, one for histological and the other for chemical work.

In addition to the above rooms, which constitute the ground floor, the following rooms are provided in the top storey:—(4) a dark room for photographic, polarimetric, and optical work is provided; (5) a private experimental-room, which is also to be used as a gas analysis room; (6) an animal room.

*The Pathological Laboratories.*—The pathological depart-

ment occupies the upper floor of the building. It consists of a lecture-room, a professor's private laboratory, a bacteriological room, an incubating-room and a store.

The lecture-room is used for practical class work as well as an auditorium. The benches are provided with gas and water fittings for each student, each bench accommodating eight workers. Special attention has been paid to the demands of microscopical work, and light has been supplied by windows and roof lights in such a way as to make it easy to use the microscope in any part of the room. A lecture platform with a bench has been placed at the end of the room, and behind this there is a large blackboard fixed in a recess in the wall. The height of this platform is such as to make general supervision of practical classes very easy.

Adjoining this room is the professor's private laboratory. Here there are two benches, one along the north wall, which is fitted up for microscopical research, and another one parallel to it in the centre of the room fitted up for chemical and experimental research. The latter bench is double the ordinary width, and has a central trough sink which extends from one end to the other. The water supply is both from the cistern and from the main, the latter being specially used for negative pressures in filtration and for aspirating air currents in respiration work. A water motor has also been fitted up at the end of this bench.

The south wall has been utilised for shelving. At the end of the room there is a large sink and a slate table for a paraffin bath.

The bacteriological research-room is situated on the southern side of the building. There is a window bench with sufficient space for two workers, a slate table for an incubator, a large draught chamber, supplied with gas and water, for the purpose of sterilising and distilling.

Opening out of this room is the incubating-room. This apartment has its own heating apparatus, which is controlled by a regulator. The walls of it have been rendered heat-proof by a thick layer of slag wool, so that the temperature can easily be maintained at the high level requisite for the cultivation of microbes.

A small store-room, with sink and commodious shelving, completes the department specially set apart for pathology.

The architectural style adopted in these buildings is a plain type of Tudor Gothic throughout, somewhat in keeping with the Medical Schools and surrounding buildings, the façades being broken up by gables, dormers, ornamental ventilating turrets on roofs, and exhaust tower, the lighting of all rooms being by mullioned windows. The materials used in these buildings are, as far as possible, of local production, all cut stone, such as strings, sills, cornices, gable barges, eaves course, chimney caps, &c., being in finely chiselled Dungannon sandstone, all external brickwork being the manufacture of the Annadale Brick and Tile Company, Belfast.

The whole of the fittings, many of which are of very complex detail, are of the latest and most improved forms, and give entire satisfaction in use, and render the laboratory as completely equipped as any in the kingdom.

The contractors for the buildings are Messrs. Fitzpatrick Brothers, Limited, of Belfast; the heating was done by Messrs. Musgrave. The whole, including fittings, was designed and carried out under the supervision of Mr. Robert Cochrane, F.S.A., F.R.I.B.A., Board of Works, Dublin.

## THE CASE AGAINST THE ECOLE DES BEAUX-ARTS.\*

(Concluded from last week.)

**H**ERE is another criticism on a different line. In nearly all the schools which ape the Ecole, a vast amount of time is given to the matter of academic rendering. I wish I knew just what this training is supposed to accomplish. We live in a period when an architect who knows how to render his drawings is pulled back to the level of those who do not, and he must sacrifice his ability for the good of a less competent man. Therefore a competition perspective is "rendered in line only, without shadows or accessories, and with one figure intended to give scale." Under the circumstances the old fetish of academic rendering would seem to be no longer potent, but it is dominant just the same, and hundreds of valuable hours are wasted by misled students in making wonderful drawings that are without the least practical use whatever. Neither are they beautiful. They are wonderful as examples of manual dexterity, but for the life of me I cannot see that they are anything more, and the time lavished on them might, I think, be at least equally well employed in learning that there are in

\* A paper read by Mr. Ralph Adams Cram before the Boston Society of Architects and published in the *American Architect*.

existence buildings in Chartres and Amiens and Gloucester and Durham which may possibly be worth looking at.

I have already referred to the defects in the boasted academic system of planning. Let me specify them a little more carefully. They appear to me to be very serious. I have studied academic plans a good deal, and it seems to me that the majority of them show signs of having been studied out as problems in decoration, not in building. That is, the student has had in mind the making of a decorative design which should be pleasing to the eye, not necessarily compact in arrangement, convenient in composition, or indicative of fine effects in actual construction. Looked at as an ornamental figure, the typical academic plan is very successful. In a competition it would receive no consideration. If used as a working plan the resulting structure would be a failure.

Again, in the Ecole at least, I know it to be a fact that the only drawings that are considered as important are the first-floor plan and the front elevation. The former must be powerful and imposing—on paper; the second-floor plan may come anyway, and as for the section, it is worked out on the last day, principally by “niggers.” I believe the general experience is that it never comes out right, but this does not matter, for constantly designs are placed first, the sections of which show that they could not be constructed, while the second-floor plans show chimneys starting from the ceilings of *salles des fêtes*, or anywhere else, and partitions without any support whatever. And there, also, is a point to be severely criticised, the undeniable fact that in spite of the apparently severe first year's training in construction, this item is not at all considered in the design, and it does not militate in the least against the success of a plan that the partitions and chimneys on the second floor depend for their support on the same miraculous agency that held Mohammed's coffin suspended in mid air.

It is the same in the matter of lighting and ventilation. So far as studies are concerned, students are taught enough about these things theoretically, but are they induced to apply their knowledge in actual design? I am told not, and I have known of innumerable cases where much-praised designs have had as features important rooms with a single window in one corner, and school buildings with no provision for ventilation whatever. In the first case, the rooms had to be where they could not be lighted, for the balance of the plan demanded it; in the second, heating and ventilating shafts were omitted, because they were ugly and injured the unity of the plan.

It may be said that the idea of the system is not to teach practical design, but to create in a student's mind an ideal to which he will afterwards always endeavour to approximate. This may be, but if an ideal is utterly impractical, it is not much use as an ideal.

Then there is another criticism, the last I shall inflict on you. I know for a fact that in certain schools types of architecture which are inherently and damnably bad are held up to honour over types which are eternally good. Here is an example which came under my notice. The *projet* was a doorway. Among the designs was one, rococo to a degree, the columns on either side being drums, alternating square and round—you know the style. With it was handed in a drawing equally well rendered, but in a pure and delicate version of the early Italian Renaissance. The first represented a style debased and corrupted, the second that style while it was pure and admirable. The rococo design was placed first in the award.

Now this is a small matter, but it is significant, for if it is possible for the academic system to become an agency for the debasing of a student's taste instead of cultivating it, it is a legitimate subject for savage criticism.

These are some of the reasons a certain class of men have for distrusting the system at present in vogue in architectural schools, and the prejudice is growing, not lessening. Recently we have seen an honest and a courageous attempt made by various men who have studied in the Ecole to exalt its name and influence. But does their method do away with the distrust of those who cannot accept the teachings of the academic system? On the contrary, it intensifies them. Unless I am mistaken, these zealous upholders of the Ecole, nearly all of them masterly architects to whose work one must look up with honest admiration, inaugurated their movement with a competition drawn on the most approved lines of the Ecole des Beaux-Arts. I read the programme with delight. Anglomania was not in it. This was Gallomania raised to the *n<sup>th</sup>* degree. Once more our immortal old friend put in appearance, the “wealthy amateur” with the precious columns and amazing tastes, and, to prolong the influence of the academic system, draughtsmen were urged to yield to the blandishments of the aforesaid wealthy amateur, and assist him to dispose of his white-*elephantine* columns to academic advantage and the glory of the system.

I am sure I was not the only one who wondered where was the use of all this, of what possible benefit could it be to young fellows who are trying to make a living out of architecture? Where was the good? I confess I could only think of the lamented Mr. Pecksniff, who was such a shining light in the

profession, “Well, you might design a pump: now a pump is very chaste practice.”

I am told that the problem this year is on the face of it a very complete surrender to Americanism and modernity, being, nothing more nor less than a harmless, necessary tavern. This is excellent. Visions rise up at once of a lot of drawings wrought out in varying styles. One, perhaps, with the dignified walls and delicate details, the magnificent chimneys and fine verandahs of colonial Maryland. Or it may be one that brings back the memory of jolly days in little English country towns, with the amiable bar just behind us and a “pint of bitter” at one's elbow. With this subject the chance for young architects to do work that should be charming and in every way appropriate is infinite. But will any design on English or American lines find favour? Hardly. One would risk little in wagering that the prize design would be laid out on a unit of eight, that its roof would be low and covered with red tiles, and that it would bask in the glare of a Connecticut sun in the midst of colonnades and pergolas and fountains and statues, shown by little vermilion squares.

Well, here is where I stop what you will think a very unbridled tirade, but I assure you that I mean no harm by it. If anything can curb the ardour of our untamed American spirit as it expresses itself in architecture, it is the influence of academic training. But just because it may do this, it does not follow that the system is impeccable. For my own part, I still think it is peccable and I don't know why I should not say so. If, instead of exalting the Ecole and all its works to the skies, its advocates would try to see whether or no the local and contemporary conditions in America might not modify it to advantage, we might obtain a system which would be above criticism—even of architects who never had any academic training, whereas now we have one which knocks the nonsense out of students, but does not put much sense in its place. A system which strives to destroy, but does not succeed in building up—in which respect it resembles this dissertation.

## THE KAISER AS ARCHITECT.

A CORRESPONDENT of the *Daily Graphic* writes:—For some years past the Germans have been busy with the plans of a Protestant church for Jerusalem, to be erected on the piece of land presented by the Sultan to the father of the Kaiser. The original plans of the building were drawn out by a Government architect, Professor Adler, who reckoned the cost at about 26,000*l*. The Kaiser, however, wished to have his finger in the pie, or, as the French Press puts it, “his nose in the church.” Anxious that the building should have the benefit of his genius and become historic in more ways than one, the Kaiser took the plans of the Professor and altered and amended prodigiously. The result is that a tower is added to the original plans and this has been designed by the Kaiser himself. The additional expense of about 16,000*l*. is a detail compared with the glory of having the Kaiser as architect of the Protestant church in the ancient city of Solomon.

## PETERBOROUGH CATHEDRAL.

THE work of demolition of the north gable of the west front of Peterborough Cathedral is proceeding rapidly, and despite the fact that only one week has elapsed since it commenced it has progressed so far that the rose window and the surrounding masonry has been removed. About sixteen skilled workmen are employed on the demolition. Each stone of the gable is marked on a plan beforehand and measured, and its size is recorded. When dislodged it is taken down in a lift to the grass below, where the stones are laid in courses. These great stones are readily taken out. The mortar in which they lie is like dust and not so good as the “road mortar” of later generations. The huge floriated Latin cross on the summit was removed with a derrick.

Considerable interest has been aroused by the discovery of a shift to which the earlier restorers had recourse, and which clearly shows that the tilting forward of the west front began at a period many years after its completion. When the point of the gable had been removed several courses the span roof at the back was revealed, and it was evident that the face of the gable had left the roofing a considerable distance, and two new rafters (one of them a split scaffold pole) had been put in, and the slating once more brought up to the gable. In 1820 extensive operations were carried out upon the front, and the cracks then apparent between the front and the western wall “grouted” and filled in. There is now a modern crack of several inches between that filling-in and the wall of the front. Again, a test plaster was placed six months ago on a rib of the gironing over the south-west pier. This has now cracked. The core of the wall of the front has just been tested, and has been found to be

filled with a dusty mixture so loose that, when the opening is not blocked up, it runs through it like the sand of an hour-glass. Seven feet of this would have to be penetrated if the "tunnelling scheme" were carried out before the back of the facing stones could be reached.

It is hoped that the inner moulding of the great northern arch may be saved. No very great quantity of stone will have to be renewed in the facings, and where such is necessary it will be taken from the ample store of Barnack rag which the Dean and Chapter secured four years ago when the Low Farm was destroyed. The Barnack quarries are said to have been exhausted with the completion of the cathedral. Subscriptions are coming in freely, although the total is at present quite inadequate. The Marquis of Exeter has contributed 50%.

## TESSERÆ.

### Early Water-Colours.

THE efforts which had been made in the water-colour department of landscape and topographical painting, before the appearance of William Mallard Turner and Thomas Girtin, amounted to little more than to produce correct views of abbeys, castles, ancient towns and noblemen's seats. These subjects, however, were handled with no mean skill by Paul Sandby, whose memory is to be regarded with veneration by the present school who have raised so fine a superstructure upon the foundation which he laid. Michael Angelo Rooker must also be named with respect, as having contributed to the improvement of this art. He had an excellent eye for the picturesque. Many of his representations of ancient remains are drawn with that truth and characteristic detail which, whatever might be wanting to complete his works, touching their general effect, are yet sufficiently interesting to hold a due rank in the portfolio of the connoisseur. The view of the colleges on the Oxford Almanac, which were drawn and engraved by this artist, alone would remain sufficient testimony of his abilities. He was the son of Edward Rooker, also an artist in the same line, who placed Michael Angelo under the tuition of Paul Sandby. Thomas Hearne, another artist whose talent in the topographical department fairly includes him amongst the founders of our school of water-colour painting, was much admired in his day. Nothing can be more faithful to their prototypes than some of the abbey gates and castellated towers—existing remains of ancient architecture—which he made the subjects for his pencil. The mouldering walls, the remnants of carved porches, the elegant windows with their mutilated columns are represented in his small drawings with pictorial charm. John Cozens also helped to found a British school for this modern art. His drawings, however, have a different and perhaps more original—at least a more poetic character—than any of the works of the preceding worthies. His compositions embraced the vastness of nature in her grand combinations of mountains, woods and lakes, and struck out a style of effect that has been said to be the precursor to the ultimate superiority of water-colour painting which was reserved for Turner and Girtin to attain. It should be observed that this is rather said in justice to the talent of Cozens than to lessen the merits of these two superior artists, to whose works Cozens's, as regards the term paintings, bear no comparison, his being at most little more than merely tinted chiaroscuro, similar to mezzotinto prints thinly washed with colours. All that had been done in this material by Pillement, Chatelain and others were principally pastiches, or compositions from Italian, Flemish and Dutch prints, hatched in black chalk and tinted, or drawings with pencilled outlines, shadowed with Indian ink, and washed with thin colour.

### E. H. Baily, R.A., and the Duke of Wellington.

I met Baily, the sculptor, writes Haydon in his "Diary," who told me his *rencontre* with the Duke of Wellington. The Duke had written Storr & Mortimer he would see Baily on Wednesday; they told him nothing of it till Wednesday afternoon. Off he set on Thursday, and came on the Duke when he was deeply studying some papers and details connected with India (I suspect the Afghanistan affair), and after keeping him waiting a whole day, which he had set aside. The Duke came down as soon as Baily was announced, and on entering flew at him in a fury. Baily told me he included in the most violent imprecations himself with all other artists for what he called "tormenting him," adding that his career was over at forty-seven, and asking why they could not be content with what they had done already. Baily said he bent his fist to knock the clay model to pieces; but the Duke got up on the horse, and Baily modelled away. When he had done sitting he withdrew, and Baily took his bag up to the steward, and was about to retire to the inn to dine. The steward said, "Sir, the Duke expects you at dinner, and to sleep here." "Tell the Duke," said Baily, "I'll be hanged if I dine at the table of any man who uses me as he has done." Baily went to the inn,

and was drinking his wine when he saw a groom galloping towards the house. He inquired for Mr. Baily. He was shown in. Baily said, "Tell the Duke I'll neither dine at his table nor sleep at his house." The next day he went again. The Duke came in in a very bad temper and said, "I suppose I may read my letters?" He sat and read and tore open his letters in a fury. Baily finished. The Duke began to melt and excuse himself, and offered to sit again, but Baily declined. Since then the Duke told Mortimer the silversmith he would sit again. I like this, as it is amiable; but Baily would not accept it.

### Coloured Sculpture.

Form gives expression, action, motive, grace. In short, the purpose is in form. We know what is meant by form, whether it be a man, a horse, or a dog; and we know what any of these mean particularly by the particular form or arrangement of their general form when we see them. A man when about to strike presents to our view one arrangement of his form, when about to leap another, when about to ward a blow another, and so on. His face presents one form when he smiles and another when he weeps. Anger effects a new combination or form of the features of his face; and this, as far as it can be, is the case with the animals generally. Rocks, trees, edifices, &c., cannot be said, properly, to have any other expression than that which is peculiar to inanimate things; but they may have expression by resemblance to animated beings. A rock may look like the head of a man, and thus have a borrowed expression; and so with the others. I have seen clouds look "very like a camel," and even "like a whale." Thus it would seem that the spirit, or what is vital, reveals itself and its purposes through form, and as the form is so will be the revelation. The form enacts what the spirit dictates. It is the telegraph, so to speak, of the soul which moves it. There can be no change of expression or character without motion, and no motion without a something which moves. This something, whatever it be, is a form, or part of a form of forms. It follows that form is the vehicle of expression. Having attempted to show what is the office of form in art, fewer words are needed in defining that of colour. We may mistake for the moment a well-executed wax figure for a living human being, but we never mistake a statue of whatever excellence. And why? The first presents to our senses not only the form of a man, but also his very flesh, eyes and hair. The second gives us his form only, and therefore, however expressive it may be, and however like to some individual, it is not illusive. The one appears to have a fleshly body; the other, as it were, a spiritual body. The one appears to have a soul in the flesh, the other appears to be an abstract soul. Form shows how a thing is made, colour shows of what it is made; but the latter has no expression, and sometimes fails to show us of what a thing is made. A board painted flesh-colour would not look like a piece of flesh, nor would a similarly coloured piece of wax, if flat, square, or round, but mould it into the form of an arm, a hand, or a face, and instantly you suggest the thought of flesh. Giving it form has given it expression, to which the colouring has become a suitable accompaniment. Colour, then, produces illusion, and is suggestive of matter or substance, and is beautiful and attractive, or otherwise, according to its arrangement or purity. The painter can do nothing without form; the sculptor can do everything in his legitimate art without colour. The painter, then, needs form; but does the sculptor need colour? Colour the Apollo Belvidere and he ceases to be a god, a spiritual embodiment; he steps down from his throne on high, and becomes man among men; we touch him, talk to him, and handle him with familiarity. And if this is so with one statue, it would be so with all, if all were equally perfect. When Sculpture calls upon her sister Painting for aid, she acknowledges her weakness, drops her chisel, takes up the palette, and pursues a mongrel art, half sculpture, half painting—the one confessedly imperfect, or it would not have required the other, and both together a decided failure, since without glass eyes and natural hair even illusion is wanting.

### Mediæval Mosaics.

There are three great divisions of Italian Mediæval mosaics, viz. :—1. The Opus Alexandrinum, made of hard marbles and used for floors; sometimes, but very rarely, small portions of Opus Vermiculatum appear in conjunction with it. 2. The Opus Grecanicum, which is little more than No. 1, only the tesserae are made of glass, and it is occasionally found as in Sicily, with a mixture of hard precious stones, such as porphyry jasper, &c. It is used to decorate church furnishings and the lower parts of walls. The term Opus Grecanicum is sometimes applied to the Opus Alexandrinum, but it is perhaps as well, for the sake of clearness, to confine it to geometrical glass mosaics, set in marble. The base of St. Edward's shrine and the tomb of Henry III. at Westminster Abbey are examples of this sort of work, while the pavements before the high altar of the same building and in St. Edward's Chapel are excellent illustrations of Opus Alexandrinum. 3. Opus Musivum, or

figure mosaic proper, where animals, foliage and figures are executed by means of tesserae made of opaque coloured glass. Very many of the Roman churches possess apses decorated in this work, and it is used to cover the whole of the interiors of St. Mark at Venice, the cathedral at Monreale in Sicily, and the Capella Reale at Palermo.

#### Mosaic Glass Windows.

There are three distinct systems of glass-painting which for convenience sake may be termed the mosaic method, the enamel method, and the mosaic enamel method. Of these the most simple is the mosaic method. Under this system glass-paintings are composed of white glass, if they are meant to be white, or only coloured with yellow, brown and black, or else they are composed of different pieces of white and coloured glass arranged like a mosaic, in case they are intended to display a greater variety of colours. The pieces of white glass are cut to correspond with such parts of the design as are white or white and yellow, and the coloured pieces with those parts of the design which are otherwise coloured. The glass-painter in the mosaic style uses but two pigments, a stain which produces a yellow tint and a brown enamel called enamel brown. The main outlines of the design are formed, when the painting is finished, by the leads which surround and connect the various pieces of glass together, and the subordinate outlines and all the shadows, as well as all the brown and black parts, are executed by means of the enamel brown, with which colour alone a work done according to the mosaic system can be said to be painted. The yellow stain is merely used as a colour. It therefore appears that under the mosaic method each colour of the design, except yellow, brown and black, must be represented by a separate piece of glass. A limited number of colours may, however, be exhibited on the same piece of glass by the following processes:—Part of a piece of blue glass may be changed to green by means of the yellow stain. The coloured surface of coated glass may be destroyed by attrition or the application of fluoric acid, and the white glass beneath it exposed to view. This may of course be wholly or in part stained yellow, like any other white glass. Two shades of yellow may also be produced on the same piece of glass by staining some parts twice over. But unless he adopt one or other of the above-mentioned processes the glass-painter under the mosaic system cannot have more than one colour on the same piece of glass. A variety of tint or depth may often be observed in the same piece of coloured glass, arising from some accident in its manufacture. Of this a skilful glass-painter will always avail himself to correct as much as possible the stiffness of colouring necessarily belonging to this system of glass-painting. Under the enamel method, which is the most difficult of accomplishment, coloured glass is not used under any circumstances, the picture being painted on white glass with enamel colours and stains. The mosaic enamel method consists in a combination of the two former processes, white and coloured glass, as well as every variety of enamel colour and stain, being employed in it. The practical course of proceeding under each of these three methods is nearly alike. A cartoon of the design is made, upon which are also marked the shapes and sizes of the various pieces of glass. The glass is cut to these forms, and is afterwards painted and burnt, *i.e.* heated to redness in a furnace or kiln, which fixes the enamel colours and causes the stains to operate. The number of burnings to which the glass is subjected varies according to circumstances. It is in general sufficient to burn glass painted with only one enamel colour once or twice, the self-same operation sufficing also to give effect to the stain, if any is used. Where several enamel colours are employed it is necessary to burn the glass more frequently, each colour, in general, requiring to be fixed by a separate burning. It only then remains to lead the glass together and to put it up in its place.

#### Chiaroscuro in Painting.

Chiaroscuro is an Italian compound, simply signifying light and shade, but is used in a more extended sense to denote the artificial distribution of light and dark in a picture, so as to produce the best effect of the whole together, whether the light be incidental and such as the objects naturally receive or caused by local colours that are bright and luminous in themselves, in opposition to the browns and other dark colours, whether local or representing shadow, the opposition being not only of light and shadow, but also that of light-coloured objects contrasted with dark ones, by an arrangement of such local colours as will extend the breadth of light or keep down those parts of the picture that require to be obscured. The works of Rubens, Rembrandt, Sir Joshua Reynolds, with those of many other Flemish and English artists, abound in excellent examples of chiaroscuro which are preserved in the prints from them. This is not the case with regard to many of those from the old masters, the early engravers having given the light and dark of nearly the same tone, whatever the local colour of the object may be. The modern engravers have greatly improved this

part of their art, by expressing in their prints the relative strength of the light and shadow, according to the brightness or obscurity of the local tints, so as to produce the general tone of the picture. It may be proper to remark that very little of the principle of the chiaroscuro can be found in any work of art produced before the time when Giorgione, Titian and Correggio flourished. From the Venetian it descended to the Flemish school by Rubens, Vandyke, &c., and in this country Sir Joshua Reynolds, Wilson, Barrett and Gainsborough, with many others, have, like the Flemings, carried the principle and practice to a greater degree of perfection than was ever attained by the Venetian painters. It is therefore needless to seek abroad or in the works of the old masters for information in chiaroscuro, which may be better obtained from the moderns and at home.

#### Theories of the Beautiful.

Aristotle's theory of the beautiful is often referred to; his two constituents are "order and size." By size he means what is not insignificantly small, nor yet so large as to be more than the apprehension can well take in at once. This brings us near to his doctrine that virtue consists in the mean, which doctrine again has an affinity with certain views taken by Goethe, Wordsworth, George Eliot and others. They teach that it is mostly in common things that art must find its materials, especially in middle-class life, which escapes the sordidness of poverty at one extreme and the affectations of luxury on the other. A kindred notion again is that of Sir Joshua Reynolds with regard to the ideal average type. "Most people err," he says in his "Discourses," "not so much from want of capacity to find their object as from not knowing what object to pursue. This great ideal perfection and beauty are not to be sought in the heavens but upon the earth. They are about us and upon every side of us. But the power of discovering what is deformed in nature, or, in other words, what is particular and uncommon, can be acquired only by experience; and the whole beauty and grandeur of art consists in being able to get above all singular forms, local customs, particularities and details of every kind." The theory is supplemented by what Reynolds writes in his letters to the *Idler*:—"I suppose it will easily be granted that no man can judge whether any animal be beautiful of its kind or deformed who has seen only one of that species. The works of nature, if we compare one species with another, are all equally beautiful, and the preference is given from custom or some association of ideas. In creatures of the same species beauty is the medium or centre of the various forms." Mr. Ruskin's variation upon this doctrine is, that what nature does rarely will be either very beautiful or very ugly; thus he allows that a very wide departure from average type may be very beautiful, on which supposition beauty cannot be defined as average type.

#### GENERAL.

**Mr. Charles Barry** has taken his eldest son into partnership, the title of the firm being Messrs. Charles Barry & Son. From Lady Day next the offices of the firm will be in Parliament Mansions, Victoria Street, Westminster, instead of at No. 1 Westminster Chambers.

**Mr. W. H. St. John Hope, M.A.**, will on Tuesday read a paper before the applied art section of the Society of Arts on "The Artistic Treatment of Heraldry."

**A General Assembly** of Academicians and Associates was held on the 14th inst., when Mr. John Singer Sargent was elected an Academician, and Mr. Alfred Parsons and Mr. J. J. Shannon, painters, Associates.

**A Memorial** of Elie Delaunay, the painter, who was one of the last representatives of "High Art" in France, has been inaugurated in the Musée of Feltre, Nantes. It was designed by M. Montfort, architect, M. Gaucher being the sculptor.

**The Bishop of Ely** has contributed 500*l.* towards the erection of a new church in the parish of St. Saviour's, Luton.

**The French Committee** for selection of drawings for the French International Exhibition will consist of MM. Bonnier, Bouvard, Courtois-Suffit, Girault, Pascal, Pierron, Paul Sédille, Emile Trélat.

**The Building Fund** of the University Extension College, Reading, has been increased by subscriptions from Lord Wantage, Mr. Richard Benyon and Mr. Herbert Sutton, who have each given 1,000*l.* Mr. G. Palmer, Mr. G. W. Palmer, Mr. W. Palmer and Mr. A. Palmer have each contributed 500*l.* for the same object, and the Drapers' Company have promised 1,000*l.* on condition that a sum of 12,000*l.* is raised without delay. The Hampshire County Council have voted 1,000*l.* out of accumulated surplus for the foundation of exhibitions in connection with the college.

**Mr. Alexander Drew** has arranged to give six lectures before the Edinburgh Architectural Association upon "The Practical Designing of Iron and Steel Roofing."

# The Architect.

## THE WEEK.

THE action before the French Tribunal Civil, in which the Ducs of ANJOU and ORLEANS and Don CARLOS are the litigants, may seem amusing to the multitude, but it is one in which every lover of heraldry must take interest. "He that filches from me my good name," says IAGO, "robs me of that which not enriches him, and makes me poor indeed;" but as the appropriation of an escutcheon not only impoverishes the loser but enriches the spoiler it is harder to endure than any calumny. The arms of France, three fleurs-de-lys d'or "sans brisure" on an azure field, are the privilege of the eldest sons in the most direct line of descent from LOUIS XIII. If the laws of primogeniture and heraldry are to be respected, the representative of the House of BOURBON is to-day either the Duc d'ANJOU or Don CARLOS. It is true the former belongs to a family that renounced all claim to the throne of France; but it is a doubtful question whether political considerations should be allowed to override family privileges which it is the purpose of heraldry to sustain. Moreover, questions of the kind are beyond the purview of ordinary diplomatists, and were not included among the conditions of the Treaty of Utrecht. If it could be supposed heraldic rights were renounced with as much ease as claims on a throne, then DON CARLOS would possess the monopoly of the fleurs-de-lys; but we maintain that heraldry is not to be confounded with politics. The Duc d'ORLEANS represents only a younger branch, and by established laws cannot possess the escutcheon belonging to the direct line of descent. Moreover, if an act of renunciation has any value, he can only claim to be the heir of LOUIS PHILIPPE, who by his own act professed to be no more than king of the French, a position for which especial emblazonry should have been created. The existing Republic has no claim to arms, as was demonstrated during the visit of the CZAR; but that could also be asserted during LOUIS PHILIPPE's reign. The judges of the Tribunal Civil apparently are unable to comprehend the action they are trying, for they assume that as there is no king of France there are no arms for the representatives of LOUIS XIII. The truth is, there are no arms belonging to France as now constituted, while they belong to some man who has not the right to vote as a French citizen.

IN common with most of the trades, occupations and professions in Paris, the industrial designers have a syndicaté. A meeting of the members was held a week ago to discuss the important question whether women should be allowed to work in the *ateliers*. Both the State and the Municipality expend large sums on the instruction of women in art, and it would be strange if all the money was to be wasted. There was no question of competency raised; indeed, one of the master designers, who employs no less than ninety assistants, said he found that for some kinds of work women were better adapted than men. There was a stormy debate, and eventually a majority decided that every "patron" should continue to have absolute freedom to employ or not to employ women in his *atelier*. One of the grounds of opposition to the arrangement was the insalubrity of the rooms. "It is out of humanity," said one employer, "that I do not wish to have female assistants. In our *ateliers* there is neither air nor light. Men alone are able to withstand the existing conditions, and why should women be condemned to endure them?" It is evident that sanitary inspectors would find many offences in *ateliers*, but probably under no known law could such places be recognised as workshops.

THE purchase of SHAKESPEARE's house in Stratford-on-Avon was at one time contemplated by an American speculator. He intended to transport it in its entirety to the States and to exhibit it in the different towns. It would have been a profitable venture. But a house that would be likely to appeal more strongly to American sightseers was sold last week in the "Cross Keys," Washington, co. Durham, for the sum of 405*l*. It was probably never

occupied by one of the WASHINGTONS, but it was known as the Old Hall, Washington, and had a stronger claim on attention than the ancient negress who was produced by BARNUM as GEORGE WASHINGTON's nurse. The genealogy of the great President's family has been traced from WILLIAM DE HERTEBURN, who in the twelfth century obtained Washington by surrendering a township known as Hertburn or Hartburn, and paying 4*l*. to the Bishop of Durham. Apparently his family were called after the new property, for there is evidence of a WILLIAM DE WESSINGTON in 1260. GEORGE WASHINGTON was descended from a branch of that family, and the "stars and stripes" are said to be no more than an adaptation of their escutcheon, which bore "Argent, two bars gules, in chief three mullets," while the American eagle was derived from their crest, "a raven with wings indorsed proper." In 1614 the existing hall was erected by WILLIAM JAMES, Bishop of Durham, and may have replaced a building in which many WASHINGTONS were born and died. It is constructed of stone, and has two wings which project beyond the face. The windows are square and mullioned. The present state of the building would not be gratifying to any of the WASHINGTON family or to American visitors. The building is let out in tenements, and everyone knows what that signifies. The adjoining land is needed for a new cemetery, but about an acre and a half were included with the house.

At a general meeting of the Society of English Artists, held at the Regent Gallery, Regent Street, the following resolution was passed respecting the title of the Society, to which the Royal Society of British Artists had raised an objection:—"That there is no legal obligation on the part of the Society of English Artists to change the name as suggested in the letter received from the Secretary of the Royal Society of British Artists, as there is no infringement of title, as alleged; at the same time there is a feeling that the similarity of names is objectionable, and therefore we, as a young society, are desirous of meeting the wishes of the older body, and with this view it be resolved to alter the name to the Society of English Painters."

ON Monday last one of the most useful auxiliaries of the arts of construction ceased from his labours. DAVID KIRKALDY was entitled to that designation. Forty years ago he commenced practice in testing materials, and his services since that time have been invaluable to mechanical and naval engineers, as well as to architects and manufacturers. For work of that kind he seemed to be created. He was thoroughly independent, and held aloof from all societies and cliques as well as from speculators. He was cautious in all his observations, and permitted no statement of the results of tests to leave his premises without repeated scrutiny. Mr. KIRKALDY was the inventor of his testing machine, but, although he had for it almost an affection, he was always watchful of its action, as if he were afraid it would become fallible. His work was generally appreciated, and it can be said that he was allowed far more opportunities of acquiring a knowledge of the peculiarities of materials than any other experimenter in the world. Mr. KIRKALDY was born in Dundee in 1820. He was apprenticed to the late ROBERT NAPIER, of Glasgow, who was the foremost naval constructor of his time. After passing through the workshops he was engaged as designer by the firm. He was an admirable draughtsman, and he used to boast with honest pride that his section of the *Persia* (s.s.) was the only example of its class which was allowed admission to the Royal Academy. While associated with the NAPIERS he commenced his experiments on materials, and being dissatisfied with the appliances which were in use and which were rather uncertain in their results he applied his inventive power to the preparation of a new machine which should be free from defects. The outcome was such a machine as is to be seen at Southwark, and to its efficiency countless testimonies could be produced. Mr. KIRKALDY's museum contains collections of specimens which manifest its power. Until a few months back Mr. KIRKALDY was able to attend to his duties, and his death, which many will sincerely regret, was caused by failure of the heart's action.

## PLANS AND DRAWINGS.

BY A BARRISTER.

**P**RELIMINARY plans are either made subject to a special contract for that purpose, or usually, in the case of public competitions, to the terms of the advertisement; the latter mode will, therefore, require no further consideration beyond stating that, where plans are sent in for competition, the employer cannot make use of them if the competition is not proceeded with. In a Scotch case an architect prepared detailed plans. The buildings were not proceeded with, but the proprietor used the plans to his advantage in dealing with a purchaser of the ground. The proprietor denied liability on the ground that the plans had been furnished upon the footing of there being a competition. The Court considered that it lay upon the employer to prove that the employment was gratuitous, which he had failed to do.

If an architect agree to prepare such probationary plans and drawings as the employer should approve of and he fail to obtain such approval, he will have no cause of action; and if no time is fixed within which the plans are to be finished, the presumption will be that a reasonable time was intended, and the question whether a reasonable time has elapsed will be for the jury. In an action by an architect whose plans, after having been accepted, are rejected on the ground that the work cannot be done for the amount of his estimate, it seems that it is a question for the jury whether it is an express or implied condition of the contract that the estimates shall be reasonably near the actual cost. All agreements should, therefore, clearly set out the terms upon which probationary drawings, &c., are to be provided; and if it is intended that the architect should make a charge for such preliminary work under any circumstances, or in any event for work actually done, a special clause should be inserted to that effect.

The architect or engineer is the general agent of the building-owner in making drawings. But he has no authority to warrant to the builder that they are correct or that the work can be executed according to them. Nor where there are omissions from them to order those omissions as extras under a power to order extras, if they are works indispensably necessary to complete the contract. Nor where the drawings are impracticable has he any authority to order as an extra work necessary to make them practicable. If a party contracts to erect a building according to plans and specifications, under the supervision of an architect, the architect cannot change the terms without special authority. Approval of a plan by the employer will not release the architect from liability for structural defects or defects in the plans, as to which the employer is personally incompetent to decide upon mere inspection. A contractor who builds on plans made by himself assumes the responsibility of an architect, and is under the same liabilities. Speaking generally, an architect is liable for preparing improper plans which are constructionally defective, and for specifying useless and unnecessary labour and work, and for omitting proper and necessary work and labour. And should omissions have been made in the drawings or specifications by the negligence of the architect, so that if executed they would be the subject of an extra order or of a new contract, the architect will be liable; but the measure of damages could in no case be the cost of the extra works, because had the works been specified at the time the builder made his estimate, his estimate would have been by that amount higher. The basis of assessment is the damage which the building-owner has sustained by having been induced, by the negligence of the architect, to enter into a more expensive work than he would have done. And, further, inasmuch as the builder is liable for the non-performance of the work undertaken, however impracticable the plans, no liability can accrue to the engineer or architect, unless he orders alterations to rectify his own mistakes.

When there is no contract for a specific price, the architect's demanding more than a reasonable price and refusing to deliver his plan except upon payment of such larger price does not preclude him from suing for and recovering a reasonable price. He may maintain an action and retain his lien notwithstanding. Upon payment of the balance of the architect's charges he must deliver up his

plans, unless it has been stipulated that they are not to become the property of the employer.

The architect must know and comply with all general or local Acts of Parliament and all by-laws or regulations lawfully made relating to buildings on the site selected, and of the class which he undertakes to plan. Ignorance of law may make his plans defective or impossible, and expose the employer to fine or to have his building pulled down, or abated as a public nuisance. The obligation to know the law binds him to inquire as to the particular regulations applying to the place where the building is to be erected, for if an architect is employed to prepare plans for building in a defined place, there would, it seems, be an implied contract on his part with the building-owner to make the plans in accordance with the Act or by-laws relating to buildings in that place. To rebut this, it must be shown either

(a) That the building-owner wanted plans for a building which could not be built, or

(b) That the building-owner intended to do that which was illegal.

But if the contract is rendered illegal by the passing of a law or by-law after the architect has done his part in preparing the plans, he is, of course, under no liability to the employer. The architect must know to what public authorities plans are to be submitted, and must see that regulations as to inspection by the local authorities during the progress of the works are properly complied with, and the surveyor's certificate obtained. When any alterations are made on the plans as deposited, it is generally necessary to deposit the plans again and get the sanction of the local authority afresh, even where the alterations violate no statute or by-law.

If the building-owner suffers any loss from the negligence of his architect in preparing the plans and specifications, the architect is liable to the employer for such damages as he may have suffered in consequence, but not for damages which the employer has paid, but which he was not legally compellable to pay on the ground that there was no warranty, nor it would seem for loss which he has incurred by not insisting upon a contract which a builder had foolishly bound himself to perform.

## FLORENCE AND TUSCANY.—II.\*

**F**LORENCE as a city does not please me so well as Bologna," wrote JOSEPH WOODS some eighty years ago; "the streets are narrow, and the palaces are like prisons. These streets are paved with flagstones of irregular forms, variously fitted to each other. They have the appearance of wide foot-alleys; so that while at Paris everybody has to walk on the carriage-road, at Florence all the carriages seem to be on the footpath." Several changes have occurred in Florence since the "Letters of an Architect" were composed, but many of the defects which were noted in them still remain, and are likely to continue unchanged. Florence owes its peculiarities to the character of its inhabitants. The portraits and terra-cotta busts which have survived, as well as the histories, are evidence of their determination, and suggest unpleasantness. There was more individuality among them than was common in other Italian towns, and it had defects along with advantages. The right to differ was fostered and punished. The citizens formed themselves into bodies (of which there were twenty-one), that were not unlike our vestries (but with more opportunities to do evil deeds), for the purpose of gaining a share in the exercise of power over their fellow-citizens, and when any failed they were made to suffer. DANTE's fate was endured by hundreds who were unable to leave any record of their woes, and are therefore forgotten. He struggled for place, was not successful, and was banished. If he had gained the upper hand, his competitors would have met a similar or perhaps a worse doom. As DANTE was henceforth impotent, he consoled himself by imagining all he would inflict if he possessed the power of the Deity. The morose White Vestryman gratified his spite by dooming the Black Vestrymen to endless tortures. While

\* *Florence et la Toscane, Paysages et Monuments, Mœurs et Souvenirs Historiques.* Par Eugène Müntz, Membre de l'Institut, Paris. Librairie Hachette et Cie.

enjoying himself in that sort of malediction he believed he was a model Christian, worthy to hold discourse with dwellers in Paradise. His opponents were no less strong in their faith, patriotism and hatred. They were prepared to burn DANTE if they could catch him; through their influence he was compelled to run away from a refuge when he found one, and not until seventy-five years had elapsed after his death did they offer a grave for his remains. When we read of the inhuman delight in the misery of others which filled DANTE, and to which he prostituted the most noble genius, we can understand why the streets of Florence were alleys, why the great houses were a combination of forts and prisons, and why in Florentine art there is much which is not to be enjoyed. It would seem as if the Etruscan power, which revelled in hideous demons, was not conquered when the country was subjected to Rome.

In the race cruelty was inherent, and it was developed by an influence which can always be potent for evil. Commerce was powerful in Florence. It was not exercised in the modern spirit, with a breadth of view which, embracing the world, passes over tricks and stratagems as unworthy of notice. Such "royal merchants" as SHAKESPEARE imagined were derived from English originals, although they might be called by Italian names. The petty scale on which the traffic of the nobles was conducted is suggested by a few words of M. MÜNTZ, in which he explains an arrangement which is not always understood by visitors. "There is rarely an ancient Florentine palace," he says, "which has not beside the entrance a little window (*lucarne*) closed by a shutter, which served formerly for the sale of wine, oil and provisions. . . . Some fifteen years ago I used to observe people quietly going to historic dwellings with the jar for oil or wine concealed under their mantles. They were ancient clients who were in the habit of patronising the patrician families. This spectacle recalled to my mind the letters of ALESSANDRA STROZZI, the mother of the builder of the Strozzi Palace, in whose letters are mixed up details relating to housekeeping, gardening and agriculture, with others about transcendental preoccupations. While occupied with the drying of figs she was arranging for upholding the grandeur of her family." Business was mingled with every sort of affair, and to anyone who has tried to understand the anomalies of the Florentines there appears nothing extraordinary in the counsel which MICHEL ANGELO gave to his nephew, which was to marry a poor maiden, for by so doing he was, as it were, bestowing alms without abstracting money from his purse. Not even from love or devotion was the notion of profit and loss excluded.

The peculiar qualities of the Florentines were favourable to art, for it became, to some extent, independent of the patronage of individuals. A citizen found it was not wise to stand alone, and for safety's sake he joined a guild, company or society of some sort. There he found opportunities for his aversion to other men, which in fact was intensified, although it was supposed to be unselfish and under the guise of corporate emulation. If men were prevented from contests in the streets they could at least set artist's work against artist's work and abide the issue. It was as exciting a game as cock-fighting among the Athenians of the age of PERICLES. The history of Florentine art is mainly a history of competitions between artists and their backers. The citizens did not consider it was necessary to understand the conditions; they were quite as ready to take sides when the subject was beyond their comprehension. One example was seen in the competition for erecting a dome over the cathedral. After local and international competitions the work was entrusted to BRUNELLESCHI. When the commission given to FILIPPO, says VASARI, became known to the artists and citizens, some thought well of it and others ill, as always is the case with a matter which calls forth the opinions of the populace, the thoughtless and the envious. As a concession to opponents a share in the work was given to Ghiberti, to the disgust of BRUNELLESCHI, who was driven almost to madness by the arrangement. Ghiberti himself was acquainted with the competition system as it was then understood, and he appeared to be surprised when a work was entrusted to him without other conditions than the expectation that he would surpass his previous efforts.

The rivalry between corporations and individuals un-

doubtedly enriched Florence with countless works of art, for which visitors have reason to be thankful. As far as was possible, writers and scholars were also used as pawns in the game. Arts and literature were, in fact, patronised not merely for the enjoyment which they could produce, but because a claim on the services of a painter or a poet was evidence of wealth and power. The old spirit still survives. It was enough for Florence to be temporarily recognised as the capital of the new Italy to overcome the grumbling at the ruinous expenditure required to transform the city, by creating additions that would be in keeping with Paris rather than with Florence. The privilege was of short duration, which was fortunate, for otherwise the city was certain to become so new it would not be worth a visit. M. MÜNTZ, however, is an optimist, and believes the new work to be superb, and not to be surpassed in any modern city.

In his peregrination of the city the first ancient building encountered by M. MÜNTZ is the Baptistery. He is discriminating in his criticism on the portals, and points out that Ghiberti's success in the second of them is in a great measure to be attributed to his application of the laws of perspective, which his rival BRUNELLESCHI had mastered. The old system of one plane was abandoned and the panels assumed a pictorial aspect. The Bigallo, near the Baptistery, is not often noticed by modern writers. M. MÜNTZ sees in the architecture a fine example of the transition between Gothic and Renaissance. The paintings by ROSELLO and VENTURA DI MORO belong to the same period, but the sculpture is not worth praise. M. MÜNTZ admires some of the early panels in the Campanile, others he considers too trivial in subject, but the statues by DONATELLO, the *David*, *Jeremiah*, *John the Baptist*, *Abraham* and *Habakkuk* form in his opinion the glory of the structure. The sculptor was playing to the gallery when producing them, and they look as if they were modelled from well-known and undignified people in the streets, but rightly or wrongly they make a more lasting impression on the memory than more ideal figures.

There is generally some hesitation in criticising the Duomo of Florence. It has so much historic interest, a visitor wishes he could admire it with enthusiasm. The plan is excellent for a church, but the fewness of the parts does not contribute to the effect, and it cannot be conceded that Italian Gothic should so much differ from its northern relative as to be prized for bareness. M. MÜNTZ adopts the views of the late ALFRED DARCEL, who considered that the circumstances of the competition for the dome are evidence that the art of building had degenerated in Italy in the beginning of the fifteenth century; and, indeed, he considers that at an early time ARNOLPHO, although he borrowed northern ideas, was incompetent to appreciate them. M. PAUL JOANNE says the interior does not affect the imagination. If ARNOLPHO had completed his work, or had left models to guide his successors, the result might be impressive. Although the sculpture is not adequate to compensate for so much vacant space, M. MÜNTZ considers there is enough to glorify ten cathedrals and ten cities.

M. MÜNTZ, it should be mentioned, is no idolater of BRUNELLESCHI. When describing the church of St. Laurence, the parish church of the MEDICIS, which is still without a façade—although MICHEL ANGELO might have constructed one—he says that architect, with his implacable logic, sacrificed all the national souvenirs and traditions in order to revive a civilisation which was dead for a thousand years. In the ornament, the *motifs* which gave life to buildings, such as indigenous plants, family emblems and the like, were superseded by the essentially abstract forms of Classic art. The motto for a modern artist, says M. MÜNTZ, should be, "We consent to be the disciples of antiquity; we object to be its slaves." In the church of St. Laurence, MICHEL ANGELO's memorial figures of the MEDICIS rather than BRUNELLESCHI's architecture absorb the attention of visitors. It is supposed the sculptor was a disciple of the new-Platonism, and M. MÜNTZ points out that the well-known quatrain upon the *Notte*, in which the figure begs to be allowed to continue to sleep in such unhappy times, was imitated from an epigram by PLATO upon a silver vase which DIODORUS wrought. "This satyr was not sculptured by DIODORUS but entranced by him; if you touch it you will awaken it." The Princes' Chapel in the church of St.

Laurence should receive as much attention from marble-workers as the Medicean Chapel from sculptors. According to the Marquis DE SEIGNELAI, no ordinary marble was allowed to be used, but the most precious jasper. The capitals are of gilt copper, and below the bases of the pilasters were the arms of the cities or towns in the States of the Grand Duke of TUSCANY. They are emblazoned with jasper or agate, and the letters are formed of the same stones or of lapis-lazuli. One of the letters sometimes took four months to form. The cartouches which surround the arms are adorned with lapis-lazuli, mother-of-pearl and several varieties of different stones. The dome of the chapel was never completed, and only one of the tombs. The Princes' Chapel was commenced in 1604, after the plans of MATTEO NIGETTI.

In describing the Palazzo Strozzi, M. MÜNTZ refers to a doubt which has lately arisen. According to VASARI the new work was commenced by BENEDETTO DA MAJANO, and after his death was continued by SIMONE DEL POLLAJUOLO, called "il Cronaca;" but a learned Florentine, Signor DEL BADIA, has discovered that GIULIANO DA SAN GALLO received in 1489-90 the sum of 115 livres for the model of the palace. M. MÜNTZ, however, accepts the old tradition, especially as he believes there is more of a Mediaeval character in the building than is to be found in SAN GALLO'S works.

The Franciscan church of Santa Croce is another of the buildings which remained long incomplete in Florence. It was commenced in 1294 and the façade was not completed until 1863. Without the munificence of an Englishman, named SLOANE, who gave half a million of francs for the purpose, the façade would not have been attempted. The panelling is by some preferred to the later work on the outside of the cathedral. In the church are buried GALILEO, MACHIAVELLI, BOCCACCIO, Ghiberti, VASARI and others. The tomb of MICHEL ANGELO was erected from the designs of VASARI.

The faithful GIORGIO deserves to be remembered not only for his services to MICHEL ANGELO. By his "Lives of the most eminent Painters, Sculptors and Architects," the human race will be ever his debtor, for without his information little would be known about the Italian artists. VASARI was an architect as well as a painter. He was born in Arezzo, and his first attempt in painting was the copying of all the good pictures to be found in its churches. From time to time he visited his native place; he became one of the Signori priors, and obtained gratuitously from the Pope a bull to erect a chapel in its church as an expression of his gratitude to heaven. His name will always be associated with Arezzo, and when M. MÜNTZ visited the town, it was only proper that he should give a description of the house belonging to the most distinguished of the inhabitants.

It is found in the Via San Vito and is No. 27. VASARI purchased it in 1540, when he was in his twenty-eighth year, and it was there he died. M. MÜNTZ fears the house has been often altered, and is now deprived of some of its architectural ornaments. If judged by the wall-paintings in their present state, VASARI was not a marvellous decorator. There are views of Rome in the dining-room, and on the ceiling is an allegoric picture which may be interpreted as Virtue overcoming Envy, or Envy overcoming Virtue, according to the fancy of the spectator. There is an immense chimney-piece with the following inscriptions, "Ignem gladio ne fodito," and "Homo vapor est"; on the vault of another room, a small salon, are figures of Painting, Architecture and Sculpture; and in the lunettes portraits of MICHEL ANGELO, ANDREA DEL SARTO, L. VASARI, GIORGIO VASARI, LUCA SIGNORELLI, SPINELLO, ARETINO, and the Abbot B. DELLA GATTA; in a third room the figure of APOLLO, and in the pendentives are the nine Muses. The paintings appear to have been touched up by later hands.

M. MÜNTZ also describes Fiesole. In the convent FRA ANGELICO resided for several years. Some other convents in the environs of Florence are noticed and the country villas of the MEDICIS. Altogether the work forms one of the most interesting books on Italy which have ever appeared, and, as an illustrated description of the present state of many Renaissance buildings, it is invaluable. We hope the author and publishers will be persuaded to prepare companion volumes on other districts in Italy.

## THE ADVANCEMENT OF ARCHITECTURE, WITH SOME REMARKS ON THE STUDY OF GOTHIC.\*

IT is now 129 years ago since the Royal Academy of Arts was founded by His Majesty George III. It was founded at the request of Sir W. Chambers, his architect, and in the charter granted by His Majesty, and dated December 10, 1768, it was provided that there shall be "A professor of architecture who shall read annually six public lectures, calculated to form the taste of the students, to instruct them in the laws and principles of composition, to point out to them the beauties or faults of celebrated productions, to fit them for an unprejudiced study of books, and for a critical examination of structures."

At that time the tide of the Italian Renaissance was still flowing, although there were slight signs of reflux in the growing admiration for Gothic. Horace Walpole altered Strawberry Hill in the Gothic taste in 1750, while in the very year of the Royal Academy's foundation Milizia published his "Lives of the Architects," in which the works of Palladio were held up as the standard of taste. The Dilettanti Society in 1762 published the first volume of Stuart's "Antiquities of Athens," and subsequently the antiquities of Attica and Ionia, and is, I believe, still publishing works on Greek architecture. At any rate, the researches of Pullan on the Temples of Apollo Smintheus, of Bacchus at Teos, and Minerva Polias at Priene—or one, at least—was published in the year 1881.

Wilkins published his "Antiquities of Magna Græcia" in 1807, Inwood the "Erechtheum at Athens" in 1827, Penrose the "Parthenon" in 1847, 1851, 1888. Sir C. Fellowes published his works on Lycia, Caria and Lydia in 1839-47; J. Penne-thorne, "The Geometry and Optics of Ancient Architecture" in 1878, Sir C. Newton and Pullan on the "Discoveries at Halicarnassus, Cnidus and Branchidae" in 1862-63; Cockerell and Donaldson their supplements to "Stuart's Athens" in 1830, and Cockerell his "Temple of Jupiter Panhellenius and Apollo Epicurus" in 1860, and in the same year Falkener published his "Classical Museum," not to speak of foreign publications. I need hardly speak of Hittorff's "Restoration of the Temple of Empedocles at Selinus" 1851, nor of Abel Blouet's "Scientific Expedition to the Morea and to Macedonia," 1831-38.

There is no task more difficult than that of unravelling the causes of certain movements among mankind, and this is even more difficult when it is a purely intellectual movement. We speak of the Renaissance as if it were a change of taste that could be as precisely dated as a revolution or a battle, while it had been led up to for centuries, and we can only be certain of its existence and preponderance long after it had begun. In this case of a Greek movement, one prime factor in it was the enthusiasm of Winckelmann, who began to write on Greek sculpture when he was at Dresden, and afterwards published his history of ancient art about the middle of the last century, and he found sympathisers who had come to much the same conclusions before he wrote. From attention being called to the perfection of Greek architecture in 1762 and subsequently, a wave of Greek taste swept over most of the countries of Europe. The Elgin Marbles were purchased by the British Government and placed in the British Museum in 1816; even children who saw them were struck by the beauty of the Panathenaic frieze, and doubtless this revelation of beauty to the public prolonged the call for imitation Greek architecture.

The admiration, however, of Gothic increased in England, partly owing to Sir Walter Scott's novels, and partly to the efforts of such men as John Britton, Rickman, the second Pugin, the Ecclesiological Society and others. This admiration became so prevalent as to strongly influence public opinion, so that in 1840 it was determined that the Gothic style should be adopted in the new Houses of Parliament. Even before this the very champions of Classic architecture were so affected by the increasing admiration for Gothic that the great Wilkins himself dabbled in it, and Sir James Pennethorne and Professor Donaldson tried their hands at it. Decimus Burton, once a well-known Classic architect, who persisted in his creed, was so far forgotten that, when he died a few years ago, his name and works were almost unknown.

A passion for the study of Gothic spread largely in society; antiquaries, clergymen, undergraduates, heads of houses and other amateurs, as well as architects, employed their spare time and holidays in making notes on Gothic buildings in England and abroad, measured and drew out the mouldings of different dates, and a few of the more learned endeavoured to solve the mysteries of Gothic construction. In 1841 Professor Willis read an admirable paper at the Royal Institute of British Architects, called "The construction of the vaults of the Middle Ages," really a treatise on Gothic stone-cutting, greatly admired abroad and still studied by architects in this country, while the Gothic flame still burning was fanned by Mr. Ruskin.

\* An address delivered to the students of the Royal Academy on Monday last by Professor Aitchison, A.R.A.

In 1854-68 was published by that Cuvier of Gothic architecture, Viollet-le-Duc, his "Dictionary of Architecture," now of world-wide celebrity, which may be said to have completed the Gothic conquest. Casts of figures and foliage from the Gothic cathedrals and churches were collected at the Architectural Museum, and masons were encouraged to copy them; while during the professorships of Scott and Street at the Royal Academy Gothic was pronounced to be the only true architecture in the world, and that eccentric genius, W. Burges, was never tired of advocating its universal adoption. Casts of Gothic figures and foliage were collected at the South Kensington Museum, and even at the Royal Academy. There was a long struggle between those who were getting their living by paraphrasing Classic and Renaissance buildings, and by those paraphrasing Gothic buildings. Hard words were bandied about, and "Pagan" and "Papist" were affixed by their opponents to the rival practitioners.

A truce was at length concluded, and a practitioner was allowed to paraphrase Classic or Gothic, or both, without having an offensive epithet bestowed on him. Students were allowed to compete for prizes at the Royal Academy and at the R.I.B.A. in either style, much to the disgust of those brought up in the belief that Renaissance was the only admissible style.

Owing to the large increase of travelling, the publication of architectural works and the multiplication of photographs, the desire for novelty, and the absence of any proper teaching, all phases of architecture from Greek days downwards, if we except the Egyptian Hall and Angelo's School of Arms, were in turn adopted. This produced two results. The first was this—that the public looked on architects as persons keeping an architectural costumier's shop at which colourable imitations of every past style could be procured. The public still believes that Gothic has a stronger ecclesiastical flavour than any other style, and that Renaissance is more adapted for municipal buildings, so it has a Gothic architect for its churches and a Renaissance one for its other buildings. The wealthy occasionally desire the rooms of their mansions to form an architectural pattern-book, each room being of a different style or phase of a style—a Gothic chapel, a Græco-Roman hall, an Elizabethan dining-room, a Louis XIV. drawing-room, a Louis XV. boudoir, an early French Renaissance morning-room, a Roman library and a Moorish smoking-room, with perhaps a Chinese, Indian and Japanese room thrown in. The other result was, that thinking men, interested in architecture, began to ask themselves what architecture was, beyond designing habitations or shelters for men and animals, factories for making goods, warehouses for storing them and shops for selling them; why the buildings of certain countries and at certain epochs had always been admired; why the shapes and details of buildings at successive epochs were so different from one another; and why at so brilliant a period as this of the nineteenth century, when men's minds are so active and so restless, nothing but paraphrases of bygone styles were to be met with, even in important buildings? They soon saw that some of the differences in past styles were brought about by the greater number of men's wants, and by the greater complexity of society; that some were owing to an increased knowledge of materials and of their powers, and to advancement in the art of building. A good many thought that when every part of a building exactly answered its purpose, and when every redundancy had been pared away and each part took its shape according to the work it had to do, an architecture would arise of itself without further trouble—more wonderful, more perfect and one that caused more exalted emotions than any that the world had seen; but it became apparent that this was a wrong hypothesis. The wonderful iron structures of our engineers have surpassed all that was done before in the world in a scientific direction, without regard to anything but cheapness and utility, but nearly all their works are unsightly and many of them are hideous.

It is just possible that if this hypothesis could have been perfectly carried out it might have given the true solution, for we believe nature makes her organisms in the best way and with the least possible material, while most of her works are beautiful; but we have not got her materials, her knowledge nor her skill, and we are not sure either that she does not aim at beauty. Still I think that most of our minor problems point to a solution in this direction; but the major problem seems to me to wholly depend on man, for it is not the purely necessary problems that are alone to be solved, but the proper emotions that should be excited by the sight of the building. Solemnity, adoration and thankfulness should be evoked by a temple; by majesty by a building for legislation; by awe and apprehension by law courts; dignity by buildings for public offices, great officers of state and magistrates; magnificence in the mansions of merchant-princes and great manufacturers; grace and delightfulness in theatres, concert and fine-art exhibition rooms; comfort and comeliness in the houses for ordinary citizens; while the grimness of a prison should excite repulsion and terror. But, beyond these master emotions, we want each part to exhibit the

æsthetic cultivation of the day, and show not only the mastery of the architect, but the knowledge, the care and the skill of the workmen.

The lessons of how these various emotions are to be raised must be learnt from those buildings of former times which show how cognate emotions were excited. The rest depends on the genius of the architect, and the cultivation and aspirations of the best of the public. A perfect architectural monument has much more human interest given it by sculpture and by figure-painting than by pure architecture, while fine monumental colouring is another source of delight.

Sculpture and figure-painting have for their highest models the most physically perfect human beings; if the figures created by these artists will not harmonise with the architecture the architect must look to it, for his art is then below that of his brother artists, and the completed monument is patchwork. The serenity of high ideal sculpture or painting will not harmonise with coarse Romanesque nor with tormented Gothic, so you see that it does not depend on the will of the architect to adopt any past style he chooses, but the style is evolved from the necessities of the case. The rude figures of the Solomon islanders would be as much out of place in the pediment of the Parthenon as the Panathenaic frieze would be in a Norman cathedral.

I do not address you as persons anxious to get your living, and naturally the best one possible, by the exercise of a respectable calling, but as poets in structure, who not only hope but desire that the monuments you erect will call forth admiration and delight in the cultivated hundreds or thousands of years hence, and who spare no study and no pains to insure this result. What Milton says of fame is true, it is "that last infirmity of noble minds." If you feel the divine power within you that will enable you to delight millions yet unborn, you feel that fame is but an unimportant accident. You must, however, not only "scorn delights and live laborious days," but you must study as the poets have studied and see how your predecessors learned to evoke the emotions that now delight you.

As I have addressed you as poets in structure, it will not be amiss to see how the poets in words, inspired with the divine afflatus, have learned the elements of their art. Take Dante, or Milton, or Tennyson, and see how they studied all the best poetry of the past and of the present; how they mixed among mankind and studied the emotions of those around them; how they translated or paraphrased the poems of other times and of other tongues to get their hand in and to learn their art. Some of you may object that such transcendent poets as Shakespeare and Burns had but little learning; you may be sure that both of them deplored it, and endeavoured to make up for their deficiencies by learning all they could from ancient story, from ancient poetry, and from contemporary work, and by constant and piercing observation of the persons and things around them, and by repeated efforts to make their works immortal.

In our own art we see Brunelleschi, who was to become the great architect of his day, working as a journeyman goldsmith at Rome, so that he might measure and study the Roman ruins and obtain from them constructive and æsthetic knowledge. In our own day we have seen Alfred Stevens getting his living by designing grates, tiles and fire-irons, while he was learning to be a great sculptor, a painter and something of an architect.

Remember that, above all things, architecture is a constructive art, and that all that you can do is to build; by that you must show your knowledge, your skill and your aspirations, your manners and your morals, and as an architect by that alone. You can, of course, avoid the study of statics by getting examples of what has been done before, and keeping well within the old lines, but this is not what the Roman, the Byzantine or the Gothic architects did; their aim was to out-strip their predecessors.

It is not the method our engineers have adopted whose works are the wonder of the world; they learnt as much as was necessary for their purpose of that part of science that underlies their practical work, and, taking iron as their material, have immeasurably surpassed all that was done before them in construction. They never would have done this if they had merely feebly copied the engineering works of the Romans. All the sciences have so far progressed that the knowledge of them amongst the ancients is only mentioned in archæological treatises. The mechanicians who have perfected the steam-engine, invented the locomotive, the spinning Jenny, the power loom and the lace weaver laugh to scorn the childish machines of the ancients; the artillerists are not contented with balistæ and catapults; the astronomers are not humble students of the "Almagest" of Ptolemy, but have discovered that the earth is a small planet revolving round the sun, that the laws of gravity control all the celestial bodies in the visible universe, and have learnt that most of the substances found on earth exist in the sun. Nor do geographers speak much of the knowledge of the earth to be found in Homer and the Pentateuch, or in the works of Strabo and Pomponius Mela.

In art, however, there is a very different story to tell. The arts may be said to appeal to the emotions through the eye and the ear, and the accumulated knowledge of them does not help us beyond a very limited distance. When accurate modelling has been attained there is little more to be learnt except how to create ideals that are, in certain respects, more perfect than the average human being; in drawing, when form can be exactly copied, and when that knowledge of perspective called foreshortening is attained, there is but the composition of line and grouping to be added, the rest depends on the imagination of the artist, whether it be to create allegorical figures or scenes from the past.

In colour there is the harmonising and contrasting of the different tints and tones to be attained, and the choice of those most appropriate to the subject of the picture; and the imitation of such subtlety of mixed colouring as is found in the nude human form.

We have no reason to believe that after the Greeks had cultivated gymnastics the human form has improved. Landscape-painting may have improved as the forms and laws of inanimate nature are better known and observed, but we have no reason to believe that the beauty of inanimate nature has increased.

Ordinary emotions have become more complex, but this can hardly be the case with the grand ones, such as æsthetic joy, heartrending grief, terror and despair. Is eloquence, wit, humour or pathos more common or more forcible than in the best ages of Greece?

I almost think the emotions being now more complex than of yore have become more difficult to portray, so that if the modern artists portray them with an effect equal to that attained by the great Classic artists, they must be greater men.

Music is said to have progressed, and if so, it has a merit beyond the other fine arts, but not being musical I cannot judge. Some of the musical critics still hold that for evoking religious emotions the Gregorian chants are as yet unsurpassed. So it may be that Aristoxenus is as superior to the modern composers as the Classic artists are to those of modern times, supposing that he was a composer as well as a writer on music. Browning, Tennyson and Mr. Swinburne, though they studied the Greek and Latin poets; are not mere humble imitators, but have tried to embody the vicissitudes and emotions of the present day in their verse, in the hopes that their poems may hold their own in comparison with the masterpieces of the past, if not surpass them. We hope the assertion is no longer true that

Old poets outsing and outlove us,  
And Catullus makes mouths at our speech.

A poet only can give us a chance of testing the truth of this saying, he alone has that accurate knowledge of the value of his own tongue which we all try to attain, and the gift of harmony and rhythm. Few have that intimate knowledge of Greek and Latin that would enable them to judge of the relative excellence of Classic poetry. Mr. Swinburne would confer on us an inestimable boon if he would give us in his verse a few translations of the most beautiful passages of the Greek and Latin poets.

It would be amusing, if it were not so melancholy, to see with what a light heart the architectural students treat the master-art they follow, every one of whose three or four branches is transcendental, each one of which may take the whole life of a man to master, and which requires genius as well, to enable any one to surpass the ancient masterpieces—I mean planning, construction, proper emotional excellence and healthfulness; yet after three years passed in an architect's office each student feels himself competent to practise if his friends can get him work. Sir John Soane's retort to a young architect is apposite. The young architect said, "I ought to understand architecture, for I was articled to it for seven years." "The time it takes to make a cheesemonger," was the reply.

When I see the long hours and the long years devoted by an artist to drawing or modelling a human figure and to the study of anatomy, and know that even then he has but the elements of his art, and may want the divine gifts that are required to make an artist, I am almost in despair at the prospects of architecture. Still, there is hope for the future in the fact of architectural students having their eyes opened to their own ignorance, which, through the teaching at the Architectural Association, they are trying to dispel. I was pleased to see a young architect working out models of masonry at the schools of the Associated Guilds in Titchfield Street. I am doing my best to dispel from the students' minds the notion that the paraphrasing of dead styles is architecture, that it is more than the means of learning how to express themselves architecturally.

Sketching in perspective is no doubt a charming accomplishment, and the young men of the present day have progressed wonderfully in this art, and though it is not without its value as a means of cultivation, still it can never teach them architecture. When I look at the sketch-book of Willars de Honecourt, the French architect of the thirteenth century, I see

that he could sketch but poorly, at whose efforts an accomplished draughtsman of the present day would laugh; but Willars could design a cathedral and see it properly carried out, and he could do this so well that he was sent for to Hungary to build one there. The art of sketching is like making a coloured sketch of the painted decoration on the soffit of a vault, useful enough as a memorandum of the excellent effect produced, but affording no information as to how the effect is obtained; to get that information the student wants a scaffold to see the actual colours used, and the methods of using them to produce the desired effect one or two hundred feet from the eye.

Although Greek architecture is the most perfect the world has yet seen, in which everything is studied with endless labour and treated with supreme ability, so that a whole building and each part answers as perfectly to the intention of the architect as the strings of a fiddle respond to the hand of the musician, it is absolutely without effect in this dull and misty climate, at least for the greater part of the year, and our brightest sunshine never produces the results obtained in its native country. In Greece the sunshine plays endless symphonies on it from daylight to dark.

It is doubtful if we can ever again have such complete simplicity owing to the number of modern wants and the complexity of modern society; still let us study it deeply and take to heart the lessons it so strongly enforces of aiming at simplicity if we hope to attain the sublime. Every architect feels that he could design the Parthenon if it had not been done before, though in this respect he is absolutely mistaken, for to attain elegant simplicity is the most difficult as well as the highest achievement of art. To make architecture simple and expressive and lovely—when loveliness is wanted—is the aim of most architects, and should be the aim of all, but for the architect to find out how to attain this in his particular work is the greatest difficulty, involving as it does the greatest efforts as well as supreme genius. In comparing Greek with modern architecture it may be said:—

We shift, and bedeck and bedrape us,  
Thou art noble, and nude, and antique.

Some pessimists say we can do nothing but paraphrase until the present civilisation of the world is submerged by a flood of savages; yet surely this is not a necessary consequence. We see that the Romans, when almost effete, when cruelty and corruption seemed hardly able to go further, managed to develop a style that equalled, if it did not surpass, the best work done in the Gold and Silver Ages of the Empire. This fact alone ought to banish despair. Let us all combine our efforts to set architecture on its feet again, and, if we can do this, I think we may be sure that the new phase of architecture that results will be a credit to our age and to our country. We should recollect that we are still, in the main, a courageous, honest, industrious and enterprising people, and I hope we are also beginning to be a tasteful people, and may hereafter make the boast of Pericles that "we love the beautiful." Wealth is the result of the virtues I have enumerated, and we should neither decry nor abuse this wealth, but learn how to use it properly for the instruction and delight of the world, and for the honour of our country.

I have touched in former lectures on the merits and peculiarities of Greek, Roman, Byzantine, Saracenic and Romanesque architecture, and I now propose to give you some remarks on Gothic, not, as Mr. Ruskin once said, "to put into a storehouse for use, but into a gallery for study." I think it will not be amiss now to show you some masterpieces of Romanesque and Gothic after the Parthenon, for all subsequent architecture is a lineal descendant from the Greek.

I think nowadays few will deny that though Gothic is very far from having attained the perfection of Greek architecture, even if it attained to the dignity of Roman, it has been able to raise emotions of perhaps a loftier sort than those raised by any other monuments; it has given us lessons in composition that at least are different from those to be learnt from any other architecture, and has shown to what perfection construction in stone may be carried. One of the æsthetic triumphs of late Gothic is the effect produced by pierced-work in stone, which is certainly different from anything west of India, and it made another stride in the logic of building. The Greeks and the Greeks alone studied how to gain the utmost effect in their buildings from brilliant sunshine in a clear air; every moulding was adapted to that end with a perfection that indicates the most profound study, corrected by experience and failure. The Gothic architects had neither the clear air nor the brilliant sunshine; as a rule the atmosphere in which they built was always more or less misty, and their sunshine, where they had any, was feeble; so they set themselves to work in the most logical way to see how effects might be obtained in the mist, by deepening shade, by strongly accentuating the parts that took the light, and by perfecting outlines to be seen against the sky.

That severe restraint that the Greeks imposed upon them-

selves the Gothic architects were not cultivated enough to practise—even supposing that they were sensible of the matchless beauty of Greek architecture, which is most improbable, for, apart from their professional knowledge and skill, the bulk of them were probably ignorant and uncultivated men. As late as the fourteenth century the French architects, the Bons, the designers of the Porta della Carta and the Cà d'Oro at Venice, were merely designated as stone-cutters (*Tagliatori di pietra*). It is scarcely likely that these Gothic architects, who had at their fingers' ends a new development of architecture, who had surpassed the Romans in the height of their buildings, and had nearly equalled them in the spans of their vaults, and were revelling in intricate geometrical forms, should have been captivated by the massiveness and simplicity of Greek architecture; they probably despised the constructive ignorance of the Greeks and their lack of ornamental geometry, and what they looked on as the absence of interesting detail. The Gothic mouldings were in all probability the result of the architects' efforts to gain the effects they wanted in their own climate. If you exclude square mouldings, such as the fillet and fascia, the Greek mouldings were the bead and torus, the quarter round, the ogee and the hollow, and in late work the cyma recta; each one infinitely varied as the case required, but rarely departing from the generic form, and in their best Doric work a very few even of this restricted number of mouldings were used, while in Gothic there were hundreds if not thousands of mouldings used in a great abbey church or a cathedral; it was therefore impossible to bestow much time on their elaboration.

I may here say that I use the word Gothic in its common signification, as the laymen's art that sprung up at the end of the Romanesque period of clerical art about the middle of the twelfth century, which for easier recollection we call the art of the thirteenth century, to its extinction in the early part of the seventeenth century.

I may also say that I do not propose to investigate Gothic archaeologically or philosophically, though both sorts of investigations are profoundly interesting. I am going to treat it practically, that is, to see what lessons we may learn from it for present use.

Many get their living by being able to copy or paraphrase Gothic, and though the desire of getting one's living is very praiseworthy, it will scarcely help us directly in advancing the art of architecture, which is the one thing to be most earnestly desired and sought after. I hope I may enlist you in this quest, for surely nothing should be more desired by architects than to see architecture again a flourishing and progressive art, expressing all the main characteristics of the wonderful epoch in which we live, and meeting the desires and raising the admiration of the most cultivated people of this epoch.

When the public realises what architecture does for a nation, even for a town, it will be treated with greater respect, and the architects will be more cherished, admired and honoured, and will thus be stimulated to make greater exertions. It must be borne in mind that it is an obtrusive art. In a town it meets you at every step, and cannot be hid away like a book, a picture, a statue, or a musical instrument. If it be real architecture, and produces the right emotions that the building should excite, it makes that building at once deeply interesting. It proclaims even in an ordinary street the relative dignity and taste, the occupation or the liking of the owner, that is, supposing he had it built for himself, while if it be a public building it bespeaks a higher or more important office, and in both cases causes admiration for the care, thought and invention bestowed upon it. At the same time it shows the character and condition of the nation at the time it was erected, and is a permanent memorial of the cultivation of the people. No reflective person can see any kind of architectural monument without it giving him a notion of the people at the time it was built; its gables, pediments, domes, spires, towers, lanterns and pinnacles diversify the sky-line and give interest to it; it tells of an expenditure of wealth and labour, of skill and invention, and gives us a sort of epitome of what the people once admired. It is full of lessons of the most important sort that we can hardly miss, while many buildings fill us with delight from their beauty. We know little of Mediæval times, and we should know much less of them were it not that Mediæval buildings are dotted all over the country. Architectural monuments may be ruined or pulled down, but, except in the case of the very small ones, they cannot be moved, and if they are beautiful, lovely, sublime or frowning, they attract persons from all parts of the world to see them, or as students to study them, and when at last, in the vicissitudes of ages, the nation that built them becomes insignificant, or is swept away, they still remain as land-marks to show how rich, powerful, scientific and tasteful it once was. How little should we know of Egypt, of Babylon or Nineveh, of Mexico and Peru, and how much less should we think of their former power and greatness if all their colossal buildings had been destroyed? Should not this reflection appeal to the patriotism of nations, and induce them to foster architecture and to honour the archi-

tecs, and should not the same reflection stimulate the architects to hand down to remote posterity, in enduring monuments, the greatness and cultivation of their time?

### ST. CROSS HOSPITAL, WINCHESTER.

THE trustees of this ancient and interesting foundation are to be congratulated, writes a correspondent of the *Times*, on having come to a conclusion on their proposed new buildings, which will leave the present precinct intact and uninterfered with by any modern excrescences. They adhere to the proposal to increase the number of inmates in the hospital, and for that purpose to take the present master's house and build a new one; but after conference with the Charity Commissioners they have decided that the new master's house is to be built, not in the ancient precinct, but outside of it, on a site which will not bring it into conflict or contact with the unique Mediæval group of church and hall and chamber, of tree and stream and meadow, which have made St. Cross famous throughout the world.

This will be an extremely satisfactory termination to those of your readers who remember the much larger proposal originally made by the majority of the trustees which, but for the support accorded to the minority in these columns in April last, would probably have been pushed through, and would have thrust a great big new almshouse into the "Park," in glaring juxtaposition with Bishop Blois's twelfth-century church and Bishop Beaufort's fifteenth-century almshouses.

Of course, the decision to build at all, even near the precinct, and to turn the master out of the precinct, will be regretted by some both within and without the body of trustees. The extrusion of the master breaks up the old "family" and destroys the historical completeness of the institution. But it must be admitted that the idea of the family has for long been only an idea. It is centuries, I believe, since the master and the brethren dined together in the common hall and lived a common life. It is years since the brethren themselves resorted to the common hall for any other purpose than to receive their rations, which they take away to devour in the seclusion of their particular lairs. Moreover, since the mastership was converted by the Court of Chancery, now nearly half a century ago, from a delightfully fat sinecure into a not over well-paid but well-worked vicarage of a popular and growing suburb, there are practical advantages in the master's house being outside the precinct. It is not particularly convenient for a parish priest to be inaccessible to his parishioners after 9 o'clock P.M., at which canonical hour the gates of the hospital are still shut to the outer world; while, if the new house had been placed on the proposed site inside the precinct, new roads for coals and furniture and for visitors' carriages would inevitably have destroyed a large part of the ancient building and its antique seclusion.

The conclusion is a compromise, but a compromise which preserves intact that for the safety of which those who were opposed to the majority of the trustees were contending.

### GLASGOW ARCHITECTURAL SOCIETY.

AT a meeting of the Architectural Society of the Glasgow Philosophical Society held on the 18th inst. Mr. A. Lindsay Miller, architect, read a paper on the subject of "A Visit to the Cathedrals of Durham and York." The paper was illustrated by numerous limelight views taken by the lecturer. Regarding Durham, he noted the very fine situation of the cathedral, situated on rising ground above the river, the wooded bank and the clustering trees forming a very delightful picture. Beginning with the history, he gave an account of the earlier structures founded by the followers of St. Cuthbert, and remarked that owing to the careful preservation of the records there was no difficulty in fixing the periods at which the different portions of the present structure were erected, nor the name of the builder bishop. By means of plans and numerous views of the interior and exterior he gave an elaborate description of the whole structure. York was afterwards considered; the interesting features in the town, such as the old water bars, &c., were noticed, and finally the Minster was described by means of a plan and photographic views. The principal objection offered, and it applied to the interior and exterior alike, was the great poverty of the design. After the first general impression gives place to a more careful consideration of the parts we find repetition and repetition everywhere. Variety, the greatest charm of Gothic architecture, is totally absent, each capital resembling its neighbour, and the same tracery repeated with the same wearisome regularity. The cathedral is also so closely surrounded by houses that a complete view of any front is almost impossible. A vote of thanks was accorded to Mr. Miller for his paper.

## NOTES AND COMMENTS.

FROM time to time during the last twenty-six years we have had to record the developments of the history of the Albany Capitol, which were stranger than are usual with American buildings. The Capitol is still incomplete. It is now said that only another million of dollars are needed, and there will be no more demands for money, but the Legislature must be familiar with that statement. Up to the present 20,653,511 dols. were expended on the work, and the cry is still for more dollars. The Capitol has been an experimental building in various ways. The original plans were abandoned, new methods of construction have been tried, contractors have been dispensed with or employed only on risky undertakings, and day labour was favoured to an extent that would gratify the London County Council. All is of no avail. The building has apparently an unlimited capacity for wasting money. It resembles in its costliness the great Basilica of Montmartre, where it is almost impossible to deliver a sermon that will be heard. In spite of all the money laid out on the Albany Capitol, it will be necessary to abandon the construction of the library and Court of Appeal. Yet on referring to the description we published with the original design in January 1870, we find that the library was to be the chief feature of the design. It was said "the library will occupy the whole of the east front of two storeys and will be 283 feet long and 54 feet wide. This will be the most attractive room in the building, and, it is believed, in the world. Its large area and lofty proportions, its views towards the north-east and south, overlooking the city and bringing in the valley of the Hudson and its western slopes for miles in each direction, will make it a favourite place of resort at all seasons of the year." After an expenditure of more than four millions sterling the most attractive room in the world will apparently have to be left for a future generation to construct.

THE Special Exhibition in the rooms of the Royal Society of Water-Colours is well worth a visit. It contains examples by members who died lately. GEORGE ALFRED FRIPP has belonged to the Society since 1841, his brother ALFRED DOWNING FRIPP since 1844, ALFRED WILLIAM HUNT since 1862, EDWARD KILLINGWORTH JOHNSON since 1866, GEORGE DU MAURIER since 1881, RICHARD BEAVIS since 1882, and LORD LEIGHTON since 1888. There are over three hundred drawings. As for LORD LEIGHTON's, they are very few and slight, for he could not be reckoned as a working member. HUNT's show his remarkable painstaking efforts, which were enough to qualify him to be reckoned among the pre-Raphaelites if they possessed sufficient vitality and cohesion to endure as a band. Among his architectural drawings is one of the Parthenon. No less novel is his *Niagara* with a hazy effect. G. A. and A. D. FRIPP represent an older school, and produced effects with probably one-tenth the strokes which HUNT found necessary. Many old acquaintances are to be seen in the room, and should be welcomed by amateurs. It is remarkable how steadfast was the patronage of the two brothers. There are very few drawings by them which are not lent. JOHNSON and BEAVIS and, to some extent, HUNT found far less favour, and the majority of their drawings could be purchased. There is much that is pleasing in JOHNSON's drawings; but for vigour and versatility those by RICHARD BEAVIS are the most remarkable. He could not be said to have preferred any one class of work, and in the Pall Mall room that was not advantageous. In no other gallery is monotony so easily pardoned, and especially if it has once gained admiration. The quality appears to be taken as a compliment by the supporters of the Society. BEAVIS's drawings greatly contribute to the interest of the gallery, for without them the walls might seem to be over-quiet.

FOR a long time it is likely to be a much debated question whether form alone, regardless of the manner of production, is sufficient to impress us. Those who take the negative side will always maintain that what is most interesting is the success of men's hands in creating beauty. But we live under conditions which make hand-work too costly, except in rare cases, and we must either depend on the aid of machines, or dispense with beauty altogether.

Besides, we do not show much faith in the power of form, *per se* if we insist on supplementing it with a sort of testimony to the difficulties which were overcome in its creation. In architectural ornament there must also be continuous repetitions, and it is not a satisfactory sight to see a human being toiling at patterns which can have no interest for him. It is evident that in most cases where hand-work is still employed, simply because by doing so ancient precedents are adhered to, a sacrifice of time and money is made to consistency without gaining a corresponding advantage. We were led into these thoughts by seeing the collection of representations of "Architects' Joinery and its Ornamentation," by Mr. F. A. FAWKES, of Chelmsford, and published by B. T. BATSFORD. Among the immense number of sections of mouldings, both plain and enriched, doors, overdoors, mantels and overmantels, we see refined lines and ornamentation that must satisfy fastidious critics. The prices would amaze the woodworkers of the last century, who were about the last to produce contours and patterns that are comparable with those exemplified. Who can estimate the advantages which are to be derived from having so much refinement in woodwork on economical terms? Or, are we to turn from it because work equally good was not to be obtained in Athens, Venice, or Rouen, except by wearisome and monotonous labour? for, according to Mr. RUSKIN's dictum, "the worth of an ornament is the time it must take before it can be cut." Beauty is therefore to be disregarded. The numerous architects who have employed Mr. FAWKES's joinery and who have testified to its excellence prove that fine forms are worth appreciation for their own sake, and the anxious care he has taken to produce those alone which will bear scrutiny, however simple they may be, deserves general encouragement. If good taste were the test, he need not fear foreign competition.

THE following declaration has been sent to Mr. PEARSON, R.A.:—We, the undermentioned architects, desire to enter our protest against the attacks made upon you in a portion of the daily Press, and to assure you of our complete confidence in you as adviser to the Dean and Chapter of Peterborough. Pray make any use of this that you please. (Signed) J. M. BRYDON, G. AITCHISON, A.R.A., W. M. FAWCETT, C. F. HAYWARD, B. INGELOW, JOHN SLATER, ERNEST GEORGE, W. EMERSON, EDWARD W. MOUNTFORD, ALEXANDER GRAHAM, ASTON WEBB, JAMES BROOKS, HENRY L. FLORENCE, ED. A. GRUNING, J. ALFRED GOTCH, R. REYNOLDS ROWE, F. C. PENROSE, F.R.S."

LAXTON's Price Book has been produced by Messrs. KELLY & Co. this year with their customary attention to detail. The volume is now more than a comprehensive list of prices, it is a legal manual and embodies besides municipal regulations. "Laxton" has attained its eightieth year, but it never was so useful a help as it is now, owing to the care and outlay of its owners to make it a trustworthy guide.

THE importance of local government in this country is suggested by the size of the new edition of "The Local Government Directory Almanac and Guide," published by Messrs. KNIGHT & Co., which contains about 700 pages. It is not easy to arrange so vast an amount of information as has to be furnished, but we must say the directory comes near to perfection. Messrs. KNIGHT have a reputation for accuracy, and as far as we have tested the pages we have not been able to discern an error. The directory is indispensable for a great many people.

## ELY CATHEDRAL.

ONCE when the late Professor Willis was serving as cicerone, he remarked that hypercritical people objected to him because he commonly declared that whatever cathedral he was describing was the most beautiful in England. There was really nothing inconsistent in his conduct. In all of our English cathedrals there are features which exercise a glamour over the student, and while he is under the sway of so much beauty, originality or power, a man must be more than mortal to be impartial. Just as poor Robert Burns was always falling captive to some new charmer, the lightning of whose eye became for the time being, as he said, "the godhead of Parnassus, and the witchery of her smile the divinity of Helicon," so the philo-cathedralist finds it is easier to be in a state of constant admiration, from Durham to Exeter, than to surrender himself to the supremacy of Lincoln, or Salisbury, or Winchester, or Canterbury, or Wells, glorious as each of these must be acknowledged and well deserving of fidelity.

Ely, for example, if consistency or unity be a test, is different from Salisbury. The fourteenth-century choir and octagon are as much out of keeping with the Norman nave as with the Early English presbytery between which they were introduced. The lady chapel is in an unusual position. The triforium is also peculiar. But where is a more beautiful Galilee porch to be found than at Ely, or a more effective east end arrangement if judged from the outside? Especially is the cathedral to be admired for its octagon, which is evidence that in the fourteenth century architecture was considered to be a progressive art, and which could meet novel needs. Mr. Fergusson does not exaggerate the importance of that experiment when he says:—

"There is perhaps no feature in the whole range of Gothic architecture, either here or on the Continent, more beautiful than the octagon of Ely as rebuilt by Alan of Walsingham, the sacrist at the time the tower fell. He, and he alone of all northern architects, seems to have conceived the idea of abolishing what was in fact the bathos of the style—the narrow tall opening of the central tower, which, though possessing exaggerated height, gave neither space nor dignity internally to the centre feature of the design. On the other hand, the necessity of stronger supports to carry the tower frequently contracted still more the one spot where, according to architectural propriety, an extended area was of vital importance to the due harmony of the design. In the present instance the architect took for the base of his design the whole width of the nave and aisles, constructing in it an octagon, the sides of which are respectively 25 feet and 30 feet, and the diameter 65 feet in one direction east and west, and 70 feet transversely. By this arrangement a central area was obtained more than three times the extent of that originally existing, and, more than this, a propriety and poetry of design which are not to be found elsewhere. All this, too, was carried out with the exquisite details of the best age of English Gothic, and the effect, in consequence, is surprisingly beautiful."

The history of Ely Cathedral is surrounded with less obscurity than prevails in other buildings. A careful paper on the subject was prepared by the late Sir Gilbert Scott, R.A., in which the origin of the different parts of the building is described and their architectural value determined at the same time. It is as follows:—

*The Pre-Norman Church.*

Of the earlier history of Ely it would be out of my province, and that of an architectural sketch, to say much, inasmuch as no part of the works of these early days remains.

Our church was one of the goodly company which owed their foundation to that holy galaxy of royal and noble English ladies whose piety and good works form so remarkable a feature in the early history of our own race, and with the sketch of whose saintly lives—as so exquisitely portrayed by the Comte de Montalembert—you are all probably well acquainted. Among these St. Hilda, St. Etheldreda, St. Sexburgha, St. Erminilda, St. Werburgha and St. Withburgha hold prominent places, all near relations, three of them queens as well as abbesses, and five at least of them foundresses of religious houses (one being our own foundress, and three successively abbesses of Ely).

It is right, however, to mention that there had previously existed a church on this spot, which, as it appears, was destroyed during the wars between East Anglia and Mercia, and its ruins are said to have formed the nucleus of St. Etheldreda's Church.

I am not aware that we have any record relating to the structure of St. Etheldreda's Church, but as it was erected from the ruins of one erected under the influence of Ethelbert, who had built his cathedral at Canterbury of stone, and was rebuilt under the influence of St. Wilfred, who had built churches of stone at Hexham, Ripon, &c., and was the personal friend of Benedict Biscop, who built churches of the same material at Jarrow and Monk Wearmouth, it is reasonable to suppose that they were all of somewhat similar structure, and our imagination

may be aided by the church at Jarrow and the western porch at Wearmouth, which still remain. These would indicate that it was a structure of the simplest possible kind, whose only decorative architectural feature was, perhaps, the turned baluster column, of which a great number have been found buried in later walls at Jarrow and some still *in situ* at Monk Wearmouth.

Whatever it may have been, the church, like those just alluded to, was laid in ruins during the dreadful invasion of the Northmen about 870, though shortly afterwards repaired, and a century later its possessions were restored though the kindly influence of Ethelwold, Bishop of Winchester, when the Benedictine monastery was first founded in connection with it, and when the bodies of SS. Etheldreda, Sexburgha, Erminilda and Werburgha were enshrined in great state in the newly consecrated church.

I know of no event bearing upon the architectural history of our church till another eventful century had passed. The kingdom had been again under Danish rule, and had been restored to the English under King Edward; it had been conquered by the Normans. Ely had become the "camp of refuge" of the true-hearted English, but had capitulated; the conqueror had reached the close of his career, the first Norman abbot was dead, and the second abbot, Simeon, the brother of Walkelin, Bishop of Winchester, and a relation of the king, had been appointed.

It is not till this juncture that the true architectural history of the church, as it now exists, commences.

*The Norman Period.*

Abbot Simeon, though a very old man when elected to the abbacy, incited by the zeal for building which so characterised the Normans, and well trained to it through having been prior of Winchester while his brother had been rebuilding its cathedral, set boldly to work to rebuild the church and the monastic offices on a scale commensurate with the vast structures which were then rising throughout the length and breadth of the land.

As was usual, he commenced with those eastern portions which were necessary to the celebration of the divine offices.

The usual plan of a Norman abbey or collegiate church consisted of an eastern arm of moderate length, which was not the choir, but the presbytery or sanctuary; a transept, with a central tower at the crossing and a nave, the choir proper occupying the crossing and one or two or more bays of the nave.

The abbot seems to have laid the foundations for the whole or most of this, but to have only proceeded with so much of the superstructure as would at first be needed. This would of necessity include the crossing and a part of the nave, where the choir would be placed. It would also include a sufficient space eastward for the sanctuary and the high altar (whether the whole of the eastern arm or not is doubtful, as we shall presently see). The abutments of the central tower would be incomplete without a portion at least of the transepts, and, as a matter of fact, the whole of them were begun.

Subsequent alterations have only spared us the transepts of Abbot Simeon's work, and these probably no higher than the triforium floor. They consisted of four bays in length (of which three only remain), and they had aisles both on their eastern and western sides. The outer bay of each had a continuation across it of the aisle arcade, forming a gallery north and south, as was once the case at Canterbury, and as still remains in Walkelin's work at Winchester.

The character of this work is very Early Norman, reminding one not only of his own and his brother's work at Winchester, but of the relics of that of Remigius in the west front at Lincoln, and of the chapel in the Tower of London, built by Gundulph for the Conqueror. It will be seen to differ much from all the other Norman work at Ely.

The eastern arm, as planned by Simeon, was not like that of Winchester, with a continuous aisle surrounding the apse, but like that at Peterborough, which was probably imitated from it. It had four regular bays from the crossing eastward with north and south aisles. There was then a group of shafts dividing these bays from the apse, and running up high in the side walls to carry a great cross arch, which, like a chancel arch, divided what we may call the holy place from the holiest of all—the apse.

The curved wall, however, of the apse proper did not spring at once from this pier, but a narrow bay intervened, as still remains at Peterborough. This, in common with the whole of the curved line, was an external wall, the aisles terminating eastward in the line of the great cross to which their ends formed abutments.

We discovered the proofs of this arrangement of the east end when we removed the floor many years ago, and Professor Willis made at the time careful measurements, and wrote a paper on the subject, of which he has since given the substance in Mr. Stewart's book.

The most remarkable part, however, of this discovery was

that the foundations of the semicircular apse had been altered into those of a square east end by a straight wall cutting across the round one. My own idea at the time was that at some period subsequent to the erection of Simeon's presbytery, the idea had been entertained of converting the apse into a square end, which had been interrupted by the more magnificent scheme of Bishop Northwold for a great eastern extension. Professor Willis, however, thinks that Simeon never carried his east end beyond the foundations, and that his successor, in continuing the work, altered its plan. This is quite possible, and the only objection I see to it is the apparent improbability if Simeon carried up the superstructure of the comparatively unimportant transepts, that he should have deferred the far more important apse. As, however, we have no reason to believe that he continued any of his work above the triforium

floor, his successors would have no difficulty in taking down what was built of the east end.

After Simeon's death in 1093 the abbacy was vacant for seven years, but either during that interval, or certainly during the six or seven years of the next abbot (Richard), the work went on so far that on October 17, 1106, the bodies of Etheldred and her companions and canonised successors were translated to the new presbytery. Those of SS. Werburga and Erminilda had, however, four years previously been removed from their places in the pre-Norman church, on account, as it is said, of "the structure of the church proceeding further demanding it." I presume that the services were still continued in the old church, which, as I imagine, stood on the site of the present nave, so that the further progress of the new church in that direction rendered the removal of its eastern parts, where the

*Photographed by S. B. Bolas & Co.*

ELY CATHEDRAL, TRANSEPT.

bodies of the abbesses lay, unavoidable, though the tomb of the foundress, probably as lying further westward, was not required to be interfered with until 1106. Such, we are told, was the case with Westminster Abbey when King Edward undertook its reconstruction. He built the eastern arm, the central tower, the transepts with a portion of the "vestibule" or nave, the remainder of the nave being deferred till the consecration of the completed portions, on account of the old church standing there, that the divine offices might not for a single day be discontinued.

The work of Abbot Richard, if we may suppose the upper storeys of the transepts and perhaps the eastern part of the nave to represent it, shows a decided advance upon Simeon's work, being really fine though still simple Early Norman work. He did away with the gallery at either end of Simeon's transepts, substituting an ornamental arcade. The marks of the old arrangement were very evident against the side arcades, but have unfortunately been rendered less so by the removal of the whitewash.

Richard's successor, Henry, became the first bishop of Ely. It is probable that he continued the nave far to the west—perhaps as far as the great western tower, though one passage in the "Liber Eliensis" which tells of a fire occurring in 1111 in the "Tower of St. Peter, which was placed at the door of the Church of Ely," would lead one to think that the nave had been completed at an earlier date. I cannot, however, think that such can have been its meaning. If it was so, it is clear that the nave was subsequently extended.

This extension, whenever effected, clearly embraced the addition of the noble western transept. This may have been begun by Bishop Henry during the twenty odd years of his episcopate, but I think it more probable that the monks themselves, under their priors, projected and commenced it during the spendthrift episcopate of Nigel, for his successor Ridel is recorded to have completed to the top the "new work towards the west"—a term which would scarcely, perhaps, have been used had the work been lying untouched for six-and-thirty years.

Photographed by S. B. Eolas & Co.

ELY CATHEDRAL, NORTH CHOIR AISLE, LOOKING EAST.

This noble feature may have been suggested by the still larger western transept already existing at Bury St. Edmunds, and in its turn it must have suggested the erection of the smaller one at Peterborough. It is a truly noble work, evincing in its lower stages a more advanced variety of Norman than the nave though working in perfectly with it. Its great apsidal chapels added largely to the dignity of its character, while the central western tower completed the magnificence of the western façade. There was clearly a westward projection also from the tower, where the present porch stands; some evidences of which were found by Mr. Essex a century ago, so that the whole must have been on a larger scale, something like what we see in the ruins of Kelso Abbey.

(To be continued.)

### THE ARCHITECTURAL ASSOCIATION.

**A**N ordinary general meeting of the above Association was held on the 15th inst. in the rooms of the Royal Institute of British Architects, Mr. Beresford Pite, president, in the chair.

The minutes of the last meeting having been read and confirmed, the secretary announced several nominations. The following gentlemen were duly elected members:—Messrs. E. F. M. Elms, S. H. Evans, W. V. Morgan, and A. W. Waddington.

The Chairman said that Mr. W. H. Seth-Smith, in furtherance of the suggestion made in his paper at the preceding meeting, had forwarded to the general committee some suggested conditions for the prize of ten guineas which he offered. A further announcement would be made after the conditions had been considered.

Mr. E. Prioleau Warren read his paper on

#### Decorative Plaster-work (with Models).

Among the subsidiary arts with which the architect has to deal there are few of more general application or importance than that of the plasterer. So much of our construction nowadays is of necessity concealed, and plaster is so handy a means of concealment, and indeed, when rightly used, so excellent a one, that its use in the interiors of buildings is inevitable.

It is a material so sympathetic and lending itself so easily to decorative treatment and the repetition of ornamental design, that a vast amount of decorative plaster-work—good, bad and indifferent, and I fear the last two adjectives are fully entitled to qualify two-thirds of the work—is being daily done. There is no one of us who can well escape its use even if he wishes to do so. It therefore behoves all of us who have to do with building and decorating to consider and to learn what can and should, or what cannot and should not be done with plaster-work, and it is much more with a desire to direct the attention of the younger members of my audience to some of its uses and abuses, than with any hope or intention of giving technical instruction that I venture to appear before you.

One of the first considerations that borders the subject of plaster-work is that of its fatal facility—which constitutes a great decorative danger. Its comparative cheapness, its possibilities of rapid workmanship and the endless and easy opportunities of reproduction that it affords—in a word, its immunity from the natural and powerful restraints that cost and structural necessities impose in most other building materials—seem to me in the case of plaster-work to render self-imposed restraint and careful discrimination more than ever necessary to the designer.

We are all of us, unhappily, familiar with the incontinent cornices of amazing horticultural suggestion, with their basket-work and lattices, their vines and passion-flowers insecurely supported by internal wires, which bedecked the chief chambers of our fathers. We all know, and none of us, I hope, love, the weirdly confectioned "centre flower" with dependent "gasalier" that formed the cherished ceiling ornament of the British householder in the fifties, the sixties, and even the seventies, and dropped, in intermittent fragments, into his tea-cup or his soup-tureen. So fearfully and wonderfully made, so all-pervading were these adornments, that they begot a natural nausea, a nausea that—as often happens in such cases—communicated itself in mental connection to the innocent material that they vulgarised, causing sober folk to forswear ornament of any kind in plaster-work, to find a safe and wholesome refuge in absolute negation, absolute plainness. This was, of course, only a partial revulsion, and was accompanied or followed by "revivals," as they are called, of many types in plaster-work, as in all architectural design. The beautiful ceilings and friezes of the seventeenth century, which made our country famous for its plaster-work, were studied to good purpose by the very few, to evil by the very many, and "Elizabethan" and "Jacobean" travesties became nearly as rife and rampant as the exuberances of the centre-flower period. "Revivals" of

Italian, French, Saracenic—indeed, of all and every bygone manner—have been practised, and there are many eminent plaster-shops where you can buy a "reach-me-down" design in imitation, superficially correct, of any style you please at so much—the term is apt—"per superficial foot." These things have had a great vogue with the uneducated. They please because they offer a romantic suggestion of a possibly romantic original or of the manorial or seigneurial appurtenances of romantic fiction; a suggestion only, for even as copies they are poor, with their dead, level floated grounds, their railway-line rigidity of "run" mouldings, their sharp arrises and mechanical "repeats." What a contrast they offer to the originals they travesty. Anyone who examines, with eyes of discernment, a good seventeenth-century English ceiling will see that, beautiful as the plan of design and forms of ornament may be in themselves, they only count for a portion of the total sum of beauty. The hand of time and recurrent coats of whitewash have often done much in contribution of effect, but the intrinsic, ineffable, underlying charm of handiwork, of human pleasure and interest, of "handling" is there.

The plain surfaces are not hard and level, they are full of slight undulations, the ribs or "strap-work" have no mechanical rigidity, they are by no means accurate at their intersections, they are softly and pleasantly moulded, and usually undulate somewhat with the uneven surface of the ceiling.

The ornamental foliations—bosses, roses and the like—when they repeat, do not do so with regimental exactitude; awkward corners caused by irregular wall lines, chimney-breasts, &c., are lightly and nonchalantly dealt with; there is no strained attempt at fit, begotten of the drawing-board; the design is curtailed, expanded, chopped off or twisted to meet the emergency in a manner that would look queer on a smart office drawing, but is delightful in reality.

Experts differ very much as to the methods of preparing the plaster used for these old ceilings, and as to the way in which they were put up. It is, of course, well known that some were rendered in lathing, some on rough withies and some on reeds or rushes. It is obvious that casting was employed in many instances for the ornamental foliations and bosses, and it is stated that a sort of stamp or pressing-mould was employed for repeating ornaments of small size, such as the roses in the beautiful ceiling at Chastleton, one or two of which I was able to examine closely, as they had fallen down. They certainly seemed to me to have been squeezed into a mould. There are many indications that a good deal of the rib-work was formed by pressing into the plaster ceiling, while still damp, lengths of rib in a similar damp condition. One finds awkward joins and curious failures to fit to a centre, in the case of radiating ribs, which warrant that idea.

If you examine a fallen bit of plaster from one of these old ceilings you will generally find it very thick and coarse—often very earthy and sometimes full of little bits of gravel, &c., the kind of stuff the conscientious architect would have to condemn. But its very coarseness helped the effect of the plain surfaces by giving them texture—a quality we so often miss nowadays. How the elaborate and complicated ceilings were designed and set out we do not know with certainty, but there was probably a rough plan, which was all that a well-skilled workman needed—he had his tools, his models and his traditions. That he had models of ornaments for ceilings and friezes we know, as we find exact repetition not only in different rooms of the same house but in different houses. And you will often find ornamental designs, obviously intended for a ceiling, formed into a frieze or used to decorate the spandrels left between the horizontal frieze and the end of a vaulted ceiling, as in the library at Merton College, Oxford. It is probable, however, that much if not most of the decorative design was modelled *in situ* on the ceiling itself, partly with tools, partly with fingers.

When fingers were used upon the actual plaster it is obvious, as any plasterer will tell you, that the lime used cannot have been as sharp as that we use now—it must have been old or deadened, or no man's fingers would stand it.

There are many lessons to be learned from the abundant examples to be found in almost every county of England of beautiful old plaster-work, while Scotland, Wales and Ireland have their characteristic examples, and one of them is the extreme importance of plain surfaces of texture. I am glad to know that within the last few years that lesson has been taken to heart by one or two artists who have turned their attention to plaster-work. There were some striking instances of the fact in the work of Mr. Ernest Gimson at the last Arts and Crafts Exhibition—work full of charm and feeling and quiet originality, and delightful in uneven surfaces, roughish texture and broad unlaboured modelling—work as different in spirit from the average mechanical plaster-work of to-day as was that of the Elizabethan or Jacobean plasterer. I believe that the first essential of success in plaster-work of frieze or ceiling is the treatment of the ground. It will be difficult but necessary, if we are to succeed, to wrest from the modern workman his ideal of perfect even-floated and set levels, innocent of the faintest undulation as fresh thin snow over a

sheet of ice, and looking just as cold and hard. It is amazing with what skill a good and conscientious plasterer, armed with his float and straight-edge, will arrive at that result. It is neat, it is smart, it is difficult to do, and he is proud of the achievement, and I do not blame him; he does well what is expected of him, and satisfies his conscience, we will hope. When his ceiling is to be subdivided by ribs or decorated with ornament of any kind he still appears to be ruled by the instinct for sharpness, hardness and rigidity. He starts with a billiard-table surface, the "ribs" are run with a zinc mould *in situ*, or are cast in a "run" reverse mould and put up subsequently, the ornaments are cast from sharp feelingless models, and the work reaches a wonderful perfection of mechanical accuracy which, to the mind of an artist, is its glaring imperfection. The arrises are sharp as razors, the beads are round and smooth as glass tubes; a correspondence religiously exact is maintained on both sides of a centre line.

The cornices are run as accurately, as mathematically as the rest, and the drawings and details are faithfully observed. The result is naturally as unsympathetic as the method. I speak of the average. I am well aware that, fortunately, there are exceptions—I am happy in believing that they are many, and the number seems likely to increase rapidly as architects increasingly devote more time and thought to what is one of the most interesting and important crafts, amongst the many that they rule. What we need, it seems to me, to fit us for a more competent control of plaster-work—as of so many crafts—is to draw less and model more. Fortunately within the last few years a good many sculptors of talent have turned their attention to decorative plaster-work, and beautiful ceilings, friezes, and panels in low relief stand to the credit of several men whose names are well known to you. There is an increasing demand for decorative work in plaster. People, even of moderate means, are no longer generally content with the blank white lids of the boxes they live in. This discontent is exemplified in many ways, one of them is that suburban joy, the patterned ceiling paper; other indications are the patent substitutes for modelled ceilings, whose illustrated catalogues, with their alluring titles, are lavished in the letter box and waste-paper basket of every architect. A desire for decorative friezes is also prevalent, and is exemplified by precisely similar instances. If this discontent is responsible for many queer results and unlovely makeshifts, it is not in itself ignoble. It is our business to divert it into wholesome channels. The instinct to enrich the ceiling or the roof is, I think, a natural one—the roof is surely as worthy of adornment as the walls. In a church or a great hall it is, or should be, the crown and glory of the whole scheme. In domestic work, in the home of the average comfortable Briton, the cheap substitute for modelled plaster-work obtains a readier acceptance on account of the fact that we dwell—most of us—like hermit crabs, in other people's shells. The leasehold condition of our occupancy has begotten a leasehold type of decoration. The householder wants something that will "last my time, don't you know"—or, at any rate, suffice for seven, fourteen or twenty-one years. So he not unnaturally shrinks from permanency, which implies cost, and he thinks the real thing costly; but, as a matter of fact, it is by no means necessarily so. With care and thought, and a little ingenuity, it is possible to get good decorative results in plaster at small cost. There are many ways, for instance, of redeeming the absolute bareness of a plain plaster ceiling, without much expenditure. You can have a well-moulded cornice, and divide your ceiling into plain panels by means of shallow ribs. At very little extra cost, if your design "repeats," you can put some simple little ornament into the panels. You can dispense with ribs, and have ornamental corner-pieces and a centre; or you can have the general field plain, and have an ornamental border next the cornice, and modelled in low, broad relief. Where your conditions make it possible, and, I should say, in a longish room or corridor, you can drop the cornice a little way down the wall, and form your ceiling to a shallow curve. This may be delightful in itself, even if quite unrelieved, or can be very effectively decorated with light ribs at intervals and simple flattish ornaments. There is really no end to the simple and effective possibilities of very slightly decorated ceilings. I have seen an old ceiling in a low room at Oxford which has four corner ornaments and a centre, very simply modelled in a highly conventionalised grape vine design—and it wants nothing more—but the plain surface is such as would horrify the skilled plasterer of to-day.

The ceiling under an ordinary collar-rafter roof frequently gives a pleasant opportunity for plaster decoration. You can accept the splayed side between ceiling and cornice and treat it as a sort of sloping frieze, ornamenting the flat under the collars more simply and sparsely, or you can fix out and form a curved or vaulted ceiling, as I have suggested before; and a vault is one of the most delightful fields for decoration.

When cost is not a closely restrictive consideration, the range of possibilities is wide—for ceiling, frieze, decorative panels on chimney-breasts, or such like positions, or for the

treatment of the walls themselves. It is sometimes desirable—in a hall or a ball-room, for instance—to treat the walls with a permanent architectural decoration that precludes further adornment by means of pictures, wall-papers or hangings, and this, if you use low relief and have a good protective base or dado, can well be done with plaster-work by means of pilasters, decorated panelling, reliefs, &c.

If pilasters are used, it is generally advisable to enclose the plaster relief in a wooden frame for preservation's sake. Whatever the field of your decoration, it is necessary, of course, to use restraint, to avoid over-crowding and fussiness, to aim at a broad decorative result, to remember that you will cheapen your devices by over-repetition and spoil your ornament by over-elaboration. The eye wants some unornamented spaces to rest upon. It seems to me in most cases wise to have rather plainly treated walls and a simple frieze, for instance, where your ceiling is elaborate, and a simple ceiling where you want an elaborate frieze. It is hardly necessary to say that your plaster-work should be "plastering" in effect, round and soft, and should not imitate the treatment of any other material.

The ceiling, frieze, panels, or whatsoever form the plaster-work may take, should fall into the architectural scheme of the interior they contribute to; they must be in coherent relation to the rest. The scale must be preserved. And there are many considerations to be taken into account in designing a frieze or ceiling. The proportion of the room, of course, first. It is obvious that the same design would be inappropriate, in one instance, if applied to two rooms, one of which was 10 feet high and the other 20 feet, and that a long, low room needs different ceiling treatment to a high square one. Then the lighting must be taken into account. Where the tops of the windows reach nearly to the ceiling, and especially where a longish room has such windows pretty evenly distributed along one side only, very delicate relief will tell at a considerable height. In the same room, if the windows are low, or so small as to give inadequate light, the relief will require to be bolder in order to tell. A room lit from two opposite sides, giving a strong cross light, is the most difficult to treat successfully. The cross light defeats the shadows and spoils the effect of relief; in such a room greater emphasis, greater sharpness of modelling, is advisable. All these remarks are intended to apply to daylight effects, but artificial lighting should be considered, too. In great reception-rooms, chiefly used at night, and in all rooms intended to be brilliantly lit—say by electric light—it is well to keep the relief rather softer and more delicate than in rooms of more ordinary character in illumination.

As a general rule, in an averagely lighted room, up to 13 feet or 14 feet in height, the relief of ceiling-mouldings or ornaments does not require very great projection if the ceiling is left white or nearly white, as relief looks exaggerated. Ribs, I think, are but rather broad and shallow in form, and with a tendency to round members rather than sharp-arrised ones. Their size, of course, must depend upon the scale of the room, the heights at which they occur and the effect aimed at. Constructional beams dividing the length of a ceiling frequently help the design greatly, and are capable of very effective treatment in themselves. In many a splendid old ceiling the ornament was confined entirely to the beams and the cornice with which they intersected.

When there are no beams I am personally inclined to prefer detachment between the decorative design of the ceiling and the cornice. I like a margin left along the cornice. This helps you if you wish to leave the ceiling whitish and to colour the cornice; and, generally speaking, the cornice must be regarded as the crown of the wall and not as the beginning of the ceiling.

However, that is, after all, a matter of design or circumstance; it is risky to generalise too freely. But it is safe to say that too much attention cannot be bestowed, first, on the ground surface—whether of ceiling, frieze, or panel—and, second, on the modelling of any ornament, whether simple rib or foliated or arabesque design. If you cannot be sure of getting good modelling, have none at all, find safety in plainness. If you wish to avoid sharpness and hardness have ribs and cornices modelled, not run. Keep them simple and broad, not liney and wiry. Generally speaking, I believe that for ceilings a more or less geometric basis for the leading lines gives the happiest effect; the arrangement should, at any rate, be ordered, if not formal. But whatever the basis and whatever the treatment, the design should essentially be a ceiling design, the ornamentation of a flat surface—to be seen from below—and in a room where it is intended to be seen from all points it should "read," as it is called, in all directions equally well, though it may have a main longitudinal or lateral tendency. It is, perhaps, hardly necessary to counsel the avoidance of any obviously unsuitable type of design for a ceiling, such as swags and festoons—suitable, perhaps, on a vertical surface like a frieze, where the sense of vertical dependence is appropriate, but inappropriate and awkward in a ceiling. A frequently effective treatment for a tallish frieze is to have some form of ornament repeated at widish intervals, the interspaces being either quite plain or filled with a plain moulded panel.

I have so far dealt with the consideration of plaster-work for the interiors of private houses. Great mansions and great civic buildings differ in degree rather than in kind from these, and, as regards their internal plaster-work, the principles applicable to smaller buildings apply to them. Where deep-beamed and coffered ceilings are used greater structural support is needed for them, and bolder modelling and moulding, of course, to preserve their relation in scale to their architecture. They often, however, present the decorative problem of the treatment of domes, of which in a civil building I have not yet seen a strikingly original treatment in plaster-work. I have seen, you have all doubtless seen, dozens of domes treated with diminishing coffered panels, whose framework ascends on converging radial lines. Wren left us many fine instances of these. The dome of St. Stephen's, Walbrook, is, I think, the most beautiful instance I know. In this dome there are four tiers of diminishing coffer panels, the second above the cornice, and the final one having panels corresponding in width to two of the first and third. And, indeed, Wren's churches, and those of his pupils and immediate successors, provide an abundant field for study of a certain type of design in plaster-work, mannered and formal—very often, but full of vigorous character and excellent workmanship.

A great deal of the plaster-work, which is by no means confined to the ceilings of our City churches is, of course, subject to the criticism of being in direct and purposeful imitation of Classical Italian models in stone or marble. The coffered soffits of the arches of St. Bride's, Fleet Street, of St. Katherine Cree, show this strongly, and it is observable that in St. Paul's Cathedral stone and plaster details are precisely of the same character. In St. Stephen's, Walbrook, there is much fine plaster-work beside the dome; there are light and narrowish arch soffits with running patterns of roses, &c., and the transverse arches of the vaulted roof mark the plain vaulting bays—unrelieved except by a large centre boss—with a boldly-modelled band of convoluted foliage ornament. The churches of St. Mary Aldermary and St. Katherine Cree both have groined Gothic ceilings in plaster—very reprehensible theoretically, but distinctly picturesque. And at St. Mary's Aldermary, the arch spandrels of the nave arcade are charmingly filled with coats of arms and flowers and fruit, &c.—a good instance of the effect of confining ornament, using it to give special emphasis to particular features of construction, the wall above the arches being perfectly plain. Christ Church, Newgate, shows a sparing use of plaster adornment. And the beautiful little interior of St. Anne and St. Agnes, Aldersgate, shows in its large decorative panel borders, its shallow arch cofferings, and the enriched soffits of its corner spaces, some graceful and delightful examples of this Anglo-Italian architectonic style of plaster-work.

It has been reserved for the last few decades of this century, and the devotees of the "Gothic Revival," to find that plaster-work is inappropriate to the interior of a church. In the seventeenth and eighteenth centuries, and until near the end of the first half of the nineteenth, plaster ceilings were the rule and not the exception in churches.

A great many very charming ones have disappeared before the hand of the restorer, but several seventeenth and numberless eighteenth-century examples remain. I am glad to see that plaster-work is regaining its place in church interiors; it provides, at any rate, a pleasing variant to ceilings of stained or painted deal, or to open roofs with timbers or small scantling and wrought "die-square." For the enriched ceiling of sanctuary chancel or side chapel, I think it is a most excellent material; and the invention of fibrous plaster makes it possible, with little difficulty and comparatively small cost, to use enriched plaster-work, not only for ceilings, but for other decorative purposes in churches.

The slabs of plaster which bear portions of the design, or completely fill separate panels, are put up like woodwork and screwed to the rafters or furring pieces put to receive them. Each slab should be composed of thinish plaster, embedding layers, usually two in number, I believe, of very wide-meshed canvas, the plaster being worked well through the meshes. They are stiffened with laths or battens and can be worked to any required angle or curve. If the relief is not great they are very light. Where a number of slabs have to be joined to form a ceiling without intermediate ribs, it is customary to pack damp canvas between their meeting edges, which not only protects them, but forms a stiff setting when it dries; the fissures are subsequently pointed in with plaster. Brass screws should be used for fixing and the screw-holes, of course, must be stopped in. If steel screws are used, the heads require to be coated with japan or paint to prevent the inevitable rust from staining the plaster.

I put up a panelled ceiling of this kind over the sanctuary at Groombridge Church some two years ago. I believe that many of you have visited that building. In that case the panels were each in one slab, and their edges were clipped by the overlapping oak ribs and fillets.

In my church of St. Clement's, at Bradford, I had the good

fortune to secure for the decoration of the chancel roof the services of Mr. George Frampton, who modelled the fibrous plaster ceiling, and of Mr. Anning Bell, who coloured it.

In this case Mr. Frampton was first provided with a model, to a scale, I think, of one-quarter full size, of one side of the covered inner roof. On this he modelled his first sketch, which, with some other details of the ceiling, he afterwards exhibited at the Arts and Crafts Exhibition two years ago. He then set to work on a full-sized model of the eastern bay, and upon the repeating ornament of shields and rose trees and the frieze of cherubs that fill the rest of the ceiling. Casts were made from his models and were screwed up, joined and stopped in the manner I have before described. The ridge, cornice and vertical ribs are of deal, and are painted and gilded with the rest of the ceiling, which was dry and paintable within a day or two of fixing.

The use of fibrous plaster enables one to escape the flatness and rigidity I have spoken of as due to floating surfaces and running mouldings. The casts bear the direct impression of the modeller's handling. The use of this material is not without its artistic dangers, the chief of which is that its modelling is not as a rule done upon the actual ceiling. It is possible, of course, to model *in situ*, and then cast from the models elsewhere, and that, I fancy, would be one of the safest ways in which to prepare the design of a fibrous ceiling, for nothing can quite come up to the actual position and the actual lighting of the building for which the work is destined. The next best method is to arrange your model in the workshop at as nearly as possible the height that the ultimate casting will occupy, approximating as far as possible the conditions of light and surroundings, and modelling the ceiling from below. If you cannot manage this, it is wise, at least, to get your model either conveyed to the site it is to occupy, or hoisted up in some similar position for your judgment of effect.

It is essential in case of a ceiling with a cornice and divided by plaster ribs to have cornice and ribs cast from models also, not run. In the case of ribs this can be efficiently done by casting a reverse from the first model and pressing the clay into it to form ribs for the model section of the ceiling. The laying of the moist clay ribs into the ground surface of the model insures the avoidance of rigidity. I have said that it is impracticable to mould with the fingers the actual plaster so as to avoid casting altogether, unless that plaster differs very much from what we generally use. But that difference is now obtained, as I am told, by the use of old or deadened lime and some special kind of sand, and ceilings and other decorative work are modelled in plaster and in position. That, it seems to me, must be the best plan possible when the object is to avoid repetition and when cost admits of it: further, where exact repetition can be avoided the better will be the result.

The consideration of decorative plaster-work for the exteriors of buildings is almost a subject by itself. As you know, a great use was made of it in certain districts, the eastern counties especially, in the fifteenth, sixteenth and seventeenth centuries. "Sparrows" house at Ipswich is a striking instance of rather coarse and crude, but very picturesque adornment. A good deal of external plaster-work (using that term to cover work in cement and selenitic mortar) has been done and is doing in our time, as several of Mr. Norman Shaw's buildings testify. Until quite recent times the old traditional and delightful "stick-work" was done by village plasterers in rendered cottage fronts, but I fear that tradition has gone the way of many others.

One suggestion I would make, with regard to external work in low relief, is that the relief should be stronger on the north side of a building than on the others.

I have now only a few words to say as to the treatment of finished internal plaster-work. When the plaster—fibrous or otherwise—is perfectly dry, it can be treated with a thin coating of wax dissolved in turpentine, wiped or rubbed here and there with a rag; this gives it a pleasant, soft, ivory like appearance that is more agreeable than the even tint of distemper. (At Groombridge I had the shields and emblems entirely gilded, and then glazed over partially with thin oil colour, the whole of the remainder being waxed.) If heraldry is employed the coats of arms must, of course, be coloured, or the blazonry is incomplete. There are some good instances of the effect of emblazoned coats occurring in a general field of toned white plaster in the cloisters of Corpus College, Oxford. It is a contrast of which I am fond, that of richly toned heraldry and toned white plaster-work. In church work it is likely that colour over the whole surface of the work may be needed, and this presents no difficulties either in the case of oil-colour or distemper; in the latter case the suction of the plaster will probably need to be stopped with a coat of priming. I referred just now to the effects of a cross light. In my opinion a ceiling lit from both sides requires colour, and perhaps gilding, more imperatively than one lit from side or end only, when the relief gets its full value through shadows.

Plaster reliefs may, of course, be readily used for decorating wall spaces or arch spandrels in churches.

There is, in fact, no end to its decorative applicability.

Time, and your patience, would fail me if I endeavoured to cover all the ground of my subject.

You will notice that I have omitted all consideration of sgraffito work and scagliola, which certainly come under the head of decorative plaster-work; I did so advisedly, for the former subject alone would readily fill the limits of a paper like this.

For similar reasons I have not treated of foreign work—Italian, French, Spanish or Moresque, European or Asiatic—the subject is really a tremendous one. If I have succeeded in arousing any interest or enthusiasm for a very attractive craft, I have realised the full intention of my paper.

Mr. L. A. Shuffey said he was not prepared to add to Mr. Warren's paper, but he thought plaster-work had gone beyond the examples which were shown. He had great pleasure in proposing a vote of thanks to Mr. Warren.

Mr. Miller considered that fibrous plaster had its virtues and its disadvantages. There were many who believed it to be a recent invention, but French authors had shown that it was used in the fourteenth century. For ceiling work fibrous plaster is very useful for renovating old ceilings, in theatrical decorations it was especially applicable, the work being so rapid and drying so quickly.

Mr. H. W. Pratt seconded the vote of thanks. He was prejudiced against the ornamental centre-pieces. Now that the electric light was so widely used he thought more consideration should be paid to the innovation, as the ceilings were shown up more than by gas light. There was a temptation to overdo the ornamentation, and great care should be taken to preserve measure.

The Chairman remarked that those who took part in their annual excursion saw a great deal of plaster work in Kent.

On putting the vote of thanks it was carried with acclamation.

The Chairman also said Mr. J. H. Fellowes-Pryne had been nominated by the committee to fill the vacancy caused by Mr. Begg's resignation as vice-president, and that at the next meeting a successor on the committee would be nominated to Mr. Pryne.

At the meeting on February 5 Mr. A. S. Flower will read a paper entitled "An Unwritten Chapter of Architectural History."

## EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of the Edinburgh Architectural Association was held on the 20th inst., Mr. G. S. Aitken in the chair, when Mr. Alexander Drew, C.E., delivered the first of a series of lectures on "The Practical Designing of Iron and Steel Roofing." At the outset the lecturer pointed out the difference in treatment which was necessary in substituting iron or steel for timber in roof framework, and noted generally the lines on which this treatment should proceed. The necessity of considerable practical training and experience was emphasised, and it was claimed that only those possessing such special training were competent to design thoroughly practical and economical structures. It was admitted, however, that in the case of the smaller and more ordinary types of framework frequently met with in everyday practice, sufficient knowledge might be acquired by study to prevent the architect from falling into serious error, and insure the result being at least practical and safe, if not the best and most economical. A vote of thanks was accorded the lecturer on the motion of Mr. D. Hunter Crawford.

## DEVON AND EXETER ARCHITECTURAL SOCIETY.

AT a meeting of the Devon and Exeter Architectural Society, held on the 21st, a lecture was delivered by Mr. Edmund Sedding on "Local Gothic Architecture." Mr. C. King presided, and those present included Messrs. E. W. Lister, J. Dwelley, B. Priestly Shires, J. H. Vincent, G. W. Hancock, W. J. Corder and E. May Leest, hon. district secretary.

Mr. Sedding said as the town of Plymouth was so favourably situated in its geographical position, it was incumbent on those who spent their lives in the midst of such scenic beauty that they should design well. It was the mass of its domestic buildings that formed the architectural status of any town. The public buildings might form a centre of interest, but if the smaller erections were mean and badly designed the status of that town would be ranked accordingly. In the choice between Classic or Gothic there was no doubt that the latter style was the national one, and was suitable to climate and our religion, and from a constructional point of view the arched form and the gable roof were more in harmony with nature and the uses to which our buildings were designed, and with the materials with which

they had to deal. Ornamentation is the most important part of architecture. On it the intellects and moral power should be concentrated. Whenever the Greeks ornamented the tops of their buildings, Englishmen should, like the Goths, ornament the bottoms, namely, the porches and windows. All ornamentation should be natural, as from the earliest times, but from our limited capacities and materials the English were forced to conventionalise. Ornamentation must be proportionate to the distance it will be seen from the eye. The lecturer, illustrating his meaning, said the leaves in a carved capital in Winchester Cathedral, at a height of 55 feet from the ground, were about 9 inches square, but in others at a short distance from the eye there were some six or eight leaves in a similar space. It was unfortunate that there was so little stimulant in their large population for the artistic craftsmen to keep in touch with old work, or even with the best modern work. But in order to design even little things—for if they could not do little things they certainly should not attempt large ones—the artist must study old work. Without help and inspiration his artistic capacities must grow weaker, as eyes would that have been long bandaged. The lecturer advised the Society to take regular excursions to visit old buildings, and try and improve the architectural prospect of Plymouth, which was not looking very bright at the present, so that it might not be said of them hereafter that it would have been better for art if they had never existed.

A vote of thanks closed the meeting.

## TESSERÆ.

### Mediæval Use of Stone.

FOR a long period the most refined taste in elegant architecture was extensively practised throughout this country upon scientific principles which, if ever equalled, have most assuredly never been surpassed, yet the quality of the stone employed seems rarely to have been considered further than for the facility with which it might be wrought by workmen. Relics of long-departed grandeur, either of the ecclesiastical or baronial order, abound in most parts of the kingdom. Nearly all these beautiful works of our ancestors are constructed with stone from the immediate neighbourhood of such buildings, apparently without any regard to colour, strata, or durability; and hence we frequently find stones of very different tints indiscriminately placed together in the same elevation, some extremely perfect, others in a very mouldering condition. Whitby Abbey is built of sandstone varying in colour from white to a dark umber brown, carelessly mingled, and presenting a motley appearance. In all cases the brown stone is more decomposed than the white. Bristol Cathedral is built of red sandstone and yellow limestone strangely intermingled. The sandstone appears to be invariably more decomposed than the limestone. King's College Chapel, at Cambridge, is built partly of white magnesian limestone from Huddlestone in Yorkshire, and a brown shelly oolite from Weldon in Northamptonshire, evidently without distinction or study to suit the architectural arrangement. The magnesian limestone is throughout much more dilapidated than the shelly oolite. It is easy to conceive the difficulties that would arise in obtaining a large quantity of so ponderous a substance as stone from the distance of only a few miles; and in situations remote from the sea, or from navigable rivers, at a period when few good roads were available, and canals were neither known nor thought of, the transporting a supply of stone for an extensive edifice would necessarily be attended with vast labour, and in many cases would appear to be an insurmountable difficulty.

### Old St. Paul's after the Great Fire.

The first thing arranged after the deplorable fire was to fit some part of the church thus ruined for a choir, wherein the dean and prebends might have divine service until the repair of the whole, or a new structure could be accomplished. It was, therefore, resolved that part of the body of it, towards the west end, might, with the least change, be made useful for that purpose; whereupon workmen were set upon it, and scaffolds raised for search of the walls, and cutting the remainder of the unmelted lead from the high roof and other parts of the church. In which employment, as also in digging up the melted lead, clearing the rubbish, taking down the remainder of the vaulted roof and walls, with the greatest part of the tower steeple, digging up the floors, sorting the stone, and carrying it to several places, repairing the convocation-house, and building new offices for the work, no less than two years (viz. the rest of the year 1666, the whole of the year 1667, and part of the year 1668) were spent. Towards the latter end of which two years they fell to casing some of those great and massy pillars which stood betwixt the middle aisle and the side aisles, beginning with those below the little north door towards the west; but before the third pillar was perfectly cased (so weak and unsound had the excessive heat of the fire left it), with the

remaining pillars and walls, which were all miserably scaled with the flames and shattered, that upon further search into them they were found to be altogether incapable of any substantial repair. It was, therefore, fully concluded that, in order to a new fabric, the foundations of the old cathedral thus made ruinous should be totally cleared, and preparation of materials, and all things needful made ready conducing to a new fabric, which work continued until April 1674.

### Phidias and his Disciples.

Agoracritus, who was sincerely devoted to the master, and Alcámenes, who was more independent, and even disputed with his instructor, applied their art principally to the images of the gods. Beauty in full bloom, combined with a mild and tranquil dignity in the features, characterised the statues of the female deities which they produced in emulation of each other—the Aphrodite in the garden, by Alcámenes, and the corresponding statue by Agoracritus, of Parian marble, which, having lost the prize, was, with the addition of the proper attributes, consecrated as Nemesis, at Rhamnus. There still exist, as works of this first of all schools of art, the architectonic sculptures with which it adorned the temples of Athens, doubtless under the immediate superintendence and direction of Phidias. First, there are preserved portions of the eighteen sculptured metopes, together with the frieze of the end of the cella in the Temple of Theseus, the style of which evidently belongs to the Phidian school; secondly, a considerable number of the metopes of the Parthenon, all ornamented in alto rilievo, as well as a great part of the frieze of the cella, besides some colossal figures and a mass of fragments from the pediments of that temple, on which latter the master himself seems chiefly to have employed his hand. In all these works there appears, on the whole, the same style of art, only that artists who belonged to the elder school, which still continued to exist, and whose workmanship is less round and flourishing, seem to have been sometimes occupied on the metopes, and that in the frieze the uniform filling up of the space which the architectonic decoration required, as well as the law of symmetry and eurythmy, in many points imposed conditions on the striving after nature and truth. Leaving this out of view, we everywhere find a truth in the imitation of nature which, without suppressing anything essential (such as the veins swollen from exertion), without ever allowing itself to be severed from nature, attained the highest nobleness and the purest beauty; a fire and a vivacity of gesture when the subject demands it, and an ease and comfort of repose where, as in the gods especially, it appeared fitting, the greatest truth and lightness in the treatment of the drapery where regularity and a certain stiffness is not requisite, a luminous projection of the leading idea and an abundance of motives in subordinate groups evincing much ingenuity of invention, and, lastly, a natural dignity and grace united with a noble simplicity and unaffectedness, without any effort to allure the senses, or any aiming at dazzling effect and display of the artist's own skill, which characterised the best age not merely of art but of Grecian life generally.

### The Houses of Parliament.

It is in the greatest of his works that we trace the effect of difficulties in bringing out Sir Charles Barry's latent genius and the native depth of his resources. Never probably had architect to labour under trammels so narrow and so galling. What have been most unsparingly fixed upon as the worst faults of the new palace at Westminster resolve themselves, on an impartial review, into little more than the iron conditions under which the architect had to labour from the first. Neither the choice of site nor level was in any way his. The lofty and noble elevation he would have gladly given was out of the question. It would have left the Abbey and the Hall buried in a hole. The space at his command—a narrow strip wedged in between the river margin on the east, the Hall, the old law courts and Parliament Street on the west—almost dictated the long unbroken line of frontage, the monotony of which has naturally met with so much disfavour. The choice of styles was limited to the Gothic and the Elizabethan; and, the latter being set aside as the hybrid of a fanciful and transient taste, there was nothing for it but to reconcile somehow the exigencies of such a site with the laws of a style which depends for its effect upon variety, irregularity and picturesque freedom. Not an inch of space could well be spared. Instead of the architect being free to embody in a vast independent design his ideas of what befitted the seat of a nation's Legislature, there was not much for him to do but to clothe in Gothic detail the utilitarian structure which had to roof over a given acreage. No wonder that the general result was the shell of a gigantic factory breaking out into a fretwork of Mediæval ornament. Towards the open vault of the sky alone did there appear the slightest semblance of an outlet for the imagination to expand. But even there the spirit of Mr. Joseph Hume frowned down upon the upward aspirations of the architect. Still, it is in the manifold and various lines which lead the eye heavenwards away

from the river level, in bold contrast of tower with spire, and in the picturesque grouping of the whole against the sky that the real power of the design is seen. The architect, it is known, had carefully studied and calculated the effect of his work at a distance. And few even of those who, on a nearer and microscopic view speak of it as a "mouldering toy," will refuse it a place among the most successful of public undertakings in modern times.

### Assyrian and Indian Art.

The general affinity between Indian and Assyrian art may be in part due to the common Turanian substratum, and common Aryan inspiration of Indian and Assyrian civilisation. When the Aryans made their way through Afghanistan and Cashmere into the Punjab, they found the plains of the Upper Indus already occupied by a Turanian race, which they indeed easily conquered, but which, as the caste regulations of the Code of Manu prove, was far superior to themselves in industrial civilisation. These aborigines already worked in metal and stone, and wove woollen, cotton and linen stuffs, knew how to dye them, and to embellish their buildings with paintings; the descriptions of Megasthenes prove that, even at its highest development, Hindu civilisation was more Turanian than Aryan, and the pre-Aryan Turanian civilisation of India must have been similar to the pre-Semitic Turanian civilisation of Babylonia, Chaldaea and Assyria, and probably preceded it. All that is monstrous in the decorative forms of Indian and Assyrian art, all that is obscene in Indian symbolism, is probably derived from common Turanian sources, anterior to direct commercial intercourse between India and Assyria. But when we find highly artificial and complicated Indian decorative designs identical in form and detail with Assyrian, we feel sure that the one must have been copied from the other, and indeed there can be no doubt that the Indian ornamental designs applied to and derived directly from sculpture, which are identical with Assyrian, were copied from the monuments of Assyria; Egyptian, of course, from Egypt. We cannot trust alone to the allusions, references, or even descriptions of the Bible, Homer, and the Ramayana and Mahabharata to identify the art manufactures of India with those of Assyria, Phœnicia and Egypt; by themselves they indicate generic likeness only, and their specific identity can be demonstrated only by a comparison of the actual remains of ancient art, and of the carved and painted representations on contemporary monuments. But when this identity has been proved from the monuments and other remains, the Bible, Homer, the Ramayana and Mahabharata and Pliny are invaluable, in that they enable us to complete our information on the sure and certain foundation so laid; and to the picture thus composed of the early civilisation of the world we are justified in giving colour and motion from the strictly traditional, still living, civilisation of India.

### GENERAL.

**The Venice Municipality** will grant three prizes of 1,500 frs., 1,000 frs. and 500 frs. respectively for the best critical essays on the Second International Fine Arts Exhibition, to be held in Venice from April 22 to October 31.

**M. Albert Ballu**, architect, has given a lecture in Paris describing the recent discoveries at Timgad in Algeria, in the course of the explorations which he is directing. The triumphal arch of Trajan, the forum, the capitol, the theatre which could contain over 3,000 spectators, and other remains were represented.

**A Monument of Pasteur** (in addition to the monumental chapel wherein his remains are deposited) is to be erected in a public place of Paris. A commission has been constituted to select the artists to whom the work is to be entrusted.

**An Exhibition** is about to be held in Paris of paintings and sculpture which are the works of actors and actresses. Madame Sarah Bernhardt is president, and the vice president is M. Bouvet of the Opéra-Comique.

**A Meeting** of the Yorkshire branch of the Sanitary Inspectors' Association, held at Bradford on Saturday last under the presidency of Mr. T. Pridgin Teale, discussed the sewage question and also the supervision of drains.

**At the last Ordinary Meeting** of the Royal Institute of British Architects, Mr. Harold Smith and Mr. R. C. James, architects, of Bristol, were elected Associates, having passed the final examinations last June. Both gentlemen are Associates of the Bristol Society of Architects.

**The Fifth Ordinary Meeting** of the Liverpool Architectural Society will be held at the Law Library, Union Court, on Monday, February 1, at 6 P.M. prompt, when a paper will be read by Mr. F. I. Thomas, entitled, "Art out of Doors," illustrated by sixty limelight views.

# The Architect.

## THE WEEK.

THE works committee of the London School Board do not appear to be satisfied with the cost of the operations of the measuring surveyor, economical as they are. At present measurements appear to be taken systematically during the progress of the works. It is now contemplated to have the variations on the contract measured up and adjusted within six weeks after the completion of the school. But the work is to be done by the quantity surveyor who took out the original quantities. The price to be paid is to be specially arranged, and a report is to be prepared showing the comparative cost of the measuring-up by outside quantity surveyors and by the Board's measuring surveyor. The quantity surveyors are to furnish the School Board with details and abstracts of their measurements, as well as of the actual cost of additions and omissions. The architect of the Board is to be answerable for the measurement of foundations, drainage, &c., which has been hitherto done by the measuring surveyor. The monthly valuations are to continue to be made by the latter. The experiment is to be tried on six selected cases at first.

ONE of the reasons for the proposed change may, however, have been suggested by a recent arbitration case. Messrs. KIRK & RANDALL were the contractors for the Elizabeth Street School, North Woolwich. A dispute arose between the Board's measuring surveyor and the contractors concerning the measurement and allowance for pumping in connection with the foundations. According to the surveyor's account, the contract provided for excavating and carting away to a depth of 22 feet. The excavation was only carried down to an average depth of 16 feet 3 inches. The contractor claimed to be paid at the same rate for his excavation to the less depth as he had in his contract for the greater depth, while the surveyor contended he should be paid at a less rate. The contract also provided for pumping and keeping the trenches clear of water to a depth of 22 feet, for which the contractor put down the sum of 153*l*. As the excavations were not carried down to the contract depth and less pumping was required, the surveyor maintained that the Board were entitled to the value of the less pumping. The two items in dispute were submitted by the contractors to the architect of the Board, who adopted the surveyor's theory. The contractors again appealed to the architect, who upheld his decision. The contractors then applied to the President of the Royal Institute of British Architects to appoint an arbitrator. This was agreed to by the Board, but only the latter question, viz. the pumping to a less depth, was submitted to arbitration by the contractors. The amount of the contractors' claim was 70*l*., the School Board's offer was 35*l*. The case was referred to Mr. E. A. GRUNING. The arbitrator's award was 68*l*. 14*s*. 10*d*. The arbitrator's fees amount to 14*l*. 19*s*., and the witnesses' fees are 12*l*. 12*s*. Payment has been made in accordance with the terms of the award.

THE first conversazione of the Society of Designers was held on last Tuesday evening by the invitation of Mr. and Mrs. PHILIP H. NEWMAN, at their studio, 21 Endsleigh Gardens. Among the notable features of a very enjoyable evening may be mentioned the exhibition on the screen of some of Mr. NEWMAN's architectural and artistic views in Normandy, Brittany and Italy, which were rendered the more interesting by a running and lucid commentary by Mr. PHENÉ SPIERS, F.S.A. Some very remarkable and artistic photographs of London by night, taken by Mr. MARTIN, were then shown by Mr. F. H. EVANS. We hear with much pleasure that Sir E. J. POYNTER, P.R.A., has consented to become an honorary member of the young and promising society; a previous engagement unfortunately prevented his appearance at the conversazione. A society of designers is needed for many reasons, and the encouragement received already from old as well as young artists is evidence that the time selected for its formation was opportune.

At the annual meeting in Leeds of the Yorkshire Archæological Society it was reported that the council, in conjunction with the Thoresby Society, had entered into an agreement with the Yorkshire College to rent the rooms of the old Medical School for a period of five years, with the option of purchase at the end of that period. The books belonging to the Society had been removed from Huddersfield. The number of members is 607, as against 615 last year, and only fifty-three are in arrear with their subscriptions as against eighty-five at the date of last annual meeting. Colonel BROOKE, who was elected president for the ensuing year, in his address referred to the work of the Society at Mount Grace Priory, which was one of the most interesting places connected with the monastic history of the country, and which, as a practically unique specimen in England of what a Carthusian monastery was, possessed an interest which perhaps hardly attached to any other place within the country. They were deeply indebted to the owners of the property for allowing the excavations to be made, and to Mr. HOPKINS for the great research which he had shown in elucidating the different matters that had been discovered.

It is not a gratifying spectacle to find architects, engineers and other technical witnesses, giving evidence in the law courts with a confidence resembling that shown by the counsel in their speeches, although it is notorious that neither witnesses nor advocates have selected the side they uphold. But in Canada, where the line between right and wrong might be supposed to be more strongly marked owing to the simplicity of the conditions of daily life, there is at least equal latitude. The subject was introduced in the presidential address of Mr. H. B. GORDON at the annual convention of the Ontario Association of Architects. According to him "the public distinctly discounts all expert evidence, and many go to the length of stating that they can hire professional experts to give any kind of evidence they like." Mr. GORDON ascribed the laxness to the method of questioning adopted by counsel and the bias derived from the manner of stating the case. His remedy for the evil is the adoption of the French system of having architectural and other experts appointed and paid by the courts to make disinterested investigations and reports. Mr. GORDON therefore suggested the co-operation of a committee selected by the Convention with another from the Society of Civil Engineers in order to discover whether such a body could be constituted.

KILMALLOCK, in the county Limerick, is often called the "Irish Baalbec," but an applied designation is no safeguard against vandalism. The town contains some remains of old buildings, and they are not too numerous to allow of the removal of any of them unless it is intended to make Kilmallock as commonplace as many other Irish towns. The latest proposition is to remove the remains of the castle. The building never was a remarkable example of architecture, but it is a memorial of one of the struggles to dominate Munster, and it has enough historic interest to ensure its preservation. The subject was brought before the last meeting of the Council of the Royal Society of Antiquaries of Ireland, when the following resolution was adopted:—"That the Council of the Royal Society of Antiquaries of Ireland has heard with regret that a presentment has been passed by the presentment sessions for the liberties of Kilmallock for the purpose of taking down the King's Castle at Kilmallock. The Council is surprised at the contemplated act of vandalism, inasmuch as the preservation and protection of ancient and historic monuments are recognised as a matter of great public interest, and trust that now public attention has been directed to the subject the presentment will not be proceeded with. The Council would further suggest that steps be immediately taken to place this interesting monument in charge of the Board of Works for protection under the 'Ancient Monuments Protection Act.'" "Presentment" is a word of bad augury for Irish antiquities, but it is to be hoped some respect for antiquity will be shown in this case by the authorities, who will be asked to approve of the vandalism decreed at the sessions.

## FORD MADOX BROWN.

THE English school of painting is distinguished from others by its variety. There could hardly be stronger evidence of that peculiarity than the exhibitions which are open at the Royal Academy and the Grafton Gallery. BROWN and LEIGHTON sprang from the same class of English life, for they were the sons of medical doctors; both studied in foreign schools, both avoided the representation of everyday life, both aspired to be decorators of buildings, both derived inspiration from books. But while there was so much in common with the painters, it would be difficult to assemble two collections of works which appear more unlike. Hardly one principle of art appears to have been received with equal respect by LEIGHTON and BROWN, and it might easily be imagined that each wished to display as marked a difference as he could from the style of the other. LEIGHTON always endeavoured to create beautiful forms, and he sought subjects in which they could be introduced. It must have been an extraordinary commission which would oblige him to represent an Homeric scene with *THESSITES* as one of the characters. What a difference appears between his *SIMOETHA* and the ferocious sorceress of the poet, who screams out menaces against *HECATE* if the love potions should fail to have the desired effect, and threatens to deny the goddess she has hitherto served. Death in the *Hercules Wrestling* is no hideous monster. At one time LEIGHTON, in his *Plague at Florence*, asserted his right to treat forms that were not beautiful, but the attempt was evidently considered by him to be a sort of escapade and was never repeated. His dislike of ugliness was, we suppose, one of the causes which kept him from becoming a portraitist unless in exceptional cases.

It would be wrong to say that MADOX BROWN was indifferent to beauty, for that would be tantamount to asserting he was not an artist, but undoubtedly he was always ready to sacrifice it to whatever he supposed was truth. He appeared to believe that whatever could be expressed by a writer was feasible in painting, and he may have often regretted the days when printed books did not exist. Would any painter but himself have the courage to make the absence of a tooth in a girl's gum the subject of a picture, and to defend his experiment on such philosophical grounds as the following:—"How any thinking person can in his mind confound together a law in nature that we have all undergone, in itself full of promise and symbolic of much, with such an accident as a broken tooth in a grown person, is to me inexplicable"? MADOX BROWN, it will be observed, does not in his remonstrance confer on beauty the omnipotence in art, and apparently does not remember that many things which exemplify laws of nature and symbolism may not be pleasing to look upon. Nor is it a sufficient excuse for exciting disagreeable notions to say a picture is Hogarthian. The *Stages of Cruelty*, which, like *Toothless*, is in the Grafton Gallery, is thus described:—"The child tortures, the dog, while her grown-up sister tortures her lover; 'love-lies-bleeding' is the instrument of torture in the one case." Without the explanation it might be supposed the child was innocently playing with the dog and the dog was enjoying himself, while the elder sister was no less innocently discussing future domestic arrangements with her lover. MADOX BROWN wished, however, to excuse himself for painting so simple a scene, and therefore, in his title at least, attempts a feat in generalising which he could not adequately express on canvas. So kindly a man was unjust to himself when he attempted to play the cynic.

Not only LEIGHTON, but the majority of painters, ancient and modern, endeavour, whenever they introduce many figures in a picture, to dispose of them in such a way that, while they all conduce to one end, there will be degrees of importance manifest among them. Hence the old rules of composition about placing the principal figures in positions where their importance will be manifest. It has happened that many stiff and spiritless pictures were manufactured from too subservient attention to such rules. It is, however, preferable to have an arrangement which will suggest the relative value of figures than one which suggests no more than a crowd which is under no control. The picture called *Work*, by MADOX BROWN, which belongs to the Manchester Corporation, and by many people is considered to be the artist's best work, is one example of the latter

class. The artist found that five, closely-printed pages from his pen were required to explain its meaning. Primarily it is a representation of a few navvies digging a trench for pipes at Hampstead. But HOMER's "Shield of Achilles" was hardly more of a reflection of the universe. In the ancient work the different scenes were kept apart. In the picture all are heaped together. CARLYLE is seen expounding in angry mood some theory to the Rev. F. D. MAURICE. Nobody listens to them, for wisdom is neglected. A member of Parliament having 15,000*l.* a year and a pack of hounds, who is riding, finds he cannot jump over the trench and the crowds. His daughter says to him, "We must go back, papa, round the other way." Pride has thus to succumb to necessity and municipal needs. A policeman observes a fruit-seller resting her oranges on a post and knocks them over the road. The administration of justice in England is in that symbolised. "Sandwich men", with election petitions announce that a maker of sausages is seeking later to enter Parliament—an indication of another English weakness. The man with a beer-tray is not merely a representative of an English need, but of "town pluck and energy contrasted with country thews and sinews." His black eye proves him to be a hero, for he must have received it "in an encounter with some huge ruffian whom he has conquered in fight and hurled out through the swing doors of the palace of gin prone on the pavement." The Flamstead Institute in the background is a satire on English science, for there Professor SNOOX is to deliver that lecture on the "Habits of the Domestic Cat," which has excited the contempt of the cats on the roof. A ragged man who sells wild flowers typifies those who were never taught to work, and is contrasted with a group of rich folk who have no need to work, and who are accompanied by a porter who bears "the pastry-cook's tray, the symbol of superfluity." There is one lady who distributes tracts and who it appears would be the better by the study of tracts containing navvies' ideas, and another lady whose business is to dress and look beautiful for our benefit. Motherless children, "a stoic from the Emerald Isle," an old sailor, young peasants in search of work, and various other representative men, women and children are to be discovered in this microcosmic picture.

The work is evidence of MADOX BROWN's belief in his mission. He could not suppose he was endowed with so much power for so humble an office as to paint figures which would give pleasure to all who looked on them. His notion of art was more exalted; it was to be a teacher of ethics and other sublimities, and accordingly he spared no toil in order to make his canvases as impressive as sermons or tracts. MADOX BROWN must often have felt he was a sort of Precursor, for if his voice could not be heard in the wilderness of London he was at least able to suggest to all who had eyes to see which was the narrow and which the broad way. The painter was inspired by the true Puritan spirit, and if he had lived two centuries earlier he would have gained the favour of CROMWELL, and be allowed to practise his art without restriction. His admiration of the Protector is suggested by the *Cromwell on his Farm*, in which the member for Huntingdon is supposed to be raised to a state of trance by the sight of a heap of weeds which two of his labourers are burning, and *Cromwell, Protector of the Vaudois*, where he is shown dictating the despatch to the most serene and potent Prince LOUIS, King of France, in favour of the Protestants of Piedmont.

MADOX BROWN was as conscientious in execution as in choice of a subject. The purchasers of his pictures would be amazed if they knew how many hours were occupied with the smallest of his works. In some of his early pictures, such as *Parisina's Sleep* and the heads after FRANK HALS and REMBRANDT, he painted boldly; but afterwards he adopted a method which was more gratifying to his over-sensitive conscience than advantageous to his art. He employed the finest pencils, and with them he laboured on flesh and costume as if he were a line engraver. The stuff of which Eastern garments are sometimes made was not unfitly represented by such a multitude of very narrow stripes, and it must be allowed that the flesh tints are often successful, although the outer surface, being made up of lines, might be the work of a machine, but the method was fatal to breadth of effect. The extent of the labour he imposed on himself is indicated by his description

of how he painted the small picture, *The Last of England*:—"To insure the peculiar look of *light all round* which objects have on a dull day at sea, it was painted for the most part in the open air on dull days, and the flesh was painted on cold days. Absolutely without regard to the art of any period or country I have tried to render this scene as it would appear. The minuteness of detail which would be visible under such conditions of broad daylight I have thought necessary to imitate, as bringing the pathos of the subject more home to the beholder." It did not strike MADOX BROWN that a painter can be preoccupied with "minuteness of detail" until he sacrifices more essential qualities to it. His painstaking is further seen in his costumes and details. The pictures in the Manchester Town Hall, of which there are reduced copies in the Grafton Gallery, show almost an excess of archæology. Without an explanation, what ordinary visitor to the hall would understand one part of the *Romans building Manchester*, of which the painter says:—"The general's wife, with her little boy, has stepped out of her cathedra, or litter, to take the air on the half-finished ramparts. She wears a fur cloak hooded for the cold, and on her hands are muffles. Her naturally black hair is represented as dyed yellow, her eyebrows remaining black, to indicate the luxury of Roman living, even in a camp. Her little son, who is attired in soldier's uniform and 'caliga' (boots) is mischievously aiming a kick at one of his mother's Nubian slave chair-bearers. The interior of the camp with the Roman four-square tents is to be seen behind the group."

His anxiety to be exact is further exemplified in the scenes from "King Lear." The period of the tragedy is as uncertain as that described by OSSIAN. The late E. W. GODWIN, who gave much attention to the subject, maintained that "the Early Celtic period, or a time at least from 100 B.C. to 400 B.C. is best fitted for the story. MADOX BROWN endeavoured to surmount the difficulty of defining a date for scenes which are "British nominally, Mediæval by external customs and habits, and again savage and remote by the moral side." The costumes might therefore be Roman, British or Mediæval, "but I have rather chosen," he adds, "to be in harmony with the mental characteristics of SHAKESPEARE'S work, and have therefore adopted the costume prevalent in Europe about the sixth century, when paganism was still rife and deeds were at their darkest." He apologises for introducing a fragment of the Bayeux tapestry in one of the scenes because it is an anachronism, his excuse being that it represented a hawking-scene and suggested a contrast with the exhausted LEAR. MADOX BROWN'S cartoon of *Ehud and Eglon, King of Moab*, which was prepared for a woodcut in a cheap bible, was no less a subject of earnest study. He derived the costume from Assyrian and Egyptian remains. EGLON as a Moabite he concluded would be dressed as an Assyrian, EHUD being an Israelite as an Egyptian, because his people had come from that country. And he opposed the French theory, according to which the Semitic races have not changed their character or costume from the earliest ages, a theory which he points out came suspiciously into vogue in France at the time of the conquest of Algiers.

MADOX BROWN'S pictures are, therefore, of the nature of puzzles to all who are not prepared to spend days in front of them and make efforts to decipher their meaning. It was wrong to refuse admission to any of them in the Royal Academy, but visitors to the exhibitions are not disposed for serious studies and expect to be able to "do" the galleries at a gallop. The whole meaning of a picture must be seized at a glance, and for works which retard the customary progress few would be grateful to the Academicians. MADOX BROWN lived in the hope that he was to find earnest gazers, who, taking their pleasures sadly, would be willing to devote time to the study of his pictures. There are few works in the Grafton Gallery which do not supply men and women of that sort with materials for thinking. His was one of the agglomerating spirits that cannot be contented with old fashions in literature and art, and endeavour to impart an encyclopædical character to trifles. MADOX BROWN could not introduce a couple of figures in a view of London from Hampstead without suggesting that as only in England and America a pair of the kind would be allowed out, therefore we are "true

inheritors from the Norsemen" of Iceland, whose ladies would take horse and ride for three months about the island without so much as a presumptuous question on their return from the much tolerating husbands of the period."

So ample a collection of MADOX BROWN'S works as is found in the Grafton Gallery was not heretofore seen, and probably may never be again seen. It deserves to be visited. Varied as are English artists, it is rarely that a man so peculiarly endowed as MADOX BROWN is found among them. To accomplish similar work not only exceptional ability is needed, but also a spirit of self-sacrifice which will encourage the endurance of privations rather than comply with the whims of fashion. He once entered the lists against his contemporaries, when he produced a cartoon of *The Spirit of Justice*, and another of *Harold*, in the competition for the adornment of the Houses of Parliament in 1845. But subsequently he realised he was not destined to please the crowd, and he followed his own inclinations with only a pardonable jealousy of those who, with no greater ability, easily won fame and fortune. The directors of the Grafton Gallery may claim to be the first body of men who have acted in the belief that so much labour and self-denial did not end in failure.

MADOX BROWN tried to express his thoughts in many different ways, and it may be he was not always equally clear. We can see some of the efforts of his student's days when he believed in DELACROIX and WAPPERS. Then we have the brilliant attempt to make a popular but decorative work, the sketch of *Chaucer at the Court of Edward III.*, which is Gothic by its arrangement as a triptych, and also enables the introduction of SHAKESPEARE, SPENCER and MILTON, POPE, BURNS and BYRON as descendants of the early poet. The failure to gain a space to decorate in BARRY'S building was followed by another effort to illustrate a theme in which his archæological tendencies would be shown, the scenes from "King Lear." Many another trial was made without attracting the attention of the buyers of pictures. The majority of his works were doomed to remain on his hands and to be touched up or altered as time went on. *Oure Ladye of Good Children*, which is Italian in spirit, was executed in black chalk in 1847, and the colour was added in 1861. *Wickliffe reading his Translation of the Bible* was painted in 1848 and retouched in 1861. *Byron and Mary Chaworth* occupied him at intervals during twenty years, and never got beyond a portrait study. The painter did not confine himself to works in oil. He drew cartoons for stained-glass, painted panels for furniture (as in the remarkable cabinet designed by Mr. J. P. SEDDON), and was ready to utilise his skill as an artist in any worthy form. He painted several portraits, and in the case of SHAKESPEARE collated various portraits in order to "supply the want of a credible likeness of our national poet, as a historian recasts some tale told long since by old chroniclers in many fragments." Yet all this striving was not cheered by much success. If MADOX BROWN did not feel he was bound to be true to himself, regardless of long years of neglect, he must have succumbed at an early period of his career. It is too late to make compensation, but at least we can render him the tribute of studying and discussing the works which were produced under conditions that were enough to daunt the bravest man.

## BUILDING LEASES UNDER THE SETTLED LAND ACTS.

BY A BARRISTER.

ALL persons who are not under any legal disability may make building contracts, and may grant building leases for such terms, and subject to such conditions and restrictions as are not inconsistent with the nature and quantity of the estates which they possess. There are some persons, however, who may only grant building leases subject to certain statutory restrictions and rules of law.

In carrying out a building scheme, the builder has sometimes occasion to mortgage the property. A tenant under a lease from the builder made prior to the mortgage cannot be turned out of possession (otherwise than by virtue of non-performance of covenants) by the mortgagee,

who is only the assignee of the reversion, with no other rights than those exercisable by the mortgagor. But the mortgagor, upon giving notice of his mortgage, is entitled as well to rent which has fallen due since the mortgage and remains unpaid, as to rent accruing due after notice. The Conveyancing and Law of Property Act, 1881, provides that a mortgagor of land while in possession, as against every incumbrancer, and a mortgagee while in possession, as against all prior incumbrancers, if any, and as against the mortgagor, shall have, by virtue of that Act, power to make from time to time a building lease of the mortgaged land, for any term not exceeding ninety-nine years. Every such building lease is to be made in consideration of the lessee, or some person by whose direction the lease is granted, having erected or agreeing to erect within not more than five years from the date of the lease, buildings, new or additional, or having improved or repaired buildings within that time, or having executed or agreeing to execute within that time on the land leased an improvement for or in connection with building purposes. In any such building lease, a peppercorn rent, or a nominal or other rent less than the rent ultimately payable may be made payable for the first five years, or any less part of the term. This section of the Act of 1881 (sec. 18) applies only if, and as far as, a contrary intention is not expressed by the mortgagor and mortgagee in the mortgage deed, or otherwise in writing, and has effect subject to the terms of the mortgage deed, or of any such writing, and to the provisions therein contained. All such building leases must be made in accordance with the conditions provided by the Act. If any restriction is to be placed on the power of the mortgagor to lease under the 18th section, it should at most extend to prevent him from granting leases without the consent in writing of the mortgagee.

By the provisions of the Settled Land Act, 1882, wide powers are given to a tenant for life, and with the exception of section 60, as to an infant, the management is taken entirely out of the hands of the trustees and placed in those of the tenant for life.

The general regulations respecting leases under this Act are as follows:—

1. Every lease is to be by deed, and to take effect in possession not later than twelve months after its date. But by the Settled Land Act, 1890, however, a lease for a term not exceeding three years may be by writing only and need not be by deed.

2. Every lease shall reserve the best rent that can reasonably be obtained, regard being had to any fine taken and to any money laid out or to be laid out for the benefit of the settled land, and generally to the circumstances of the case.

3. Every lease shall contain a covenant by the lessee for payment of the rent, and a condition of re-entry on the rent not being paid within a time therein specified not exceeding thirty days.

4. A counterpart of every lease shall be executed by the lessee and delivered to the tenant for life, of which execution and delivery the execution of the lease by the tenant for life shall be sufficient evidence.

5. A statement contained in a lease or in an endorsement thereon, signed by the tenant for life, respecting any matter of fact or of calculation under this Act in relation to the lease shall, in favour of the lessee and of those claiming under him, be sufficient evidence of the matter stated.

Every building lease must be made partly in consideration of the lessee or some person by whose direction the lease is granted, or some other person, having erected, or agreeing to erect buildings, new or additional, or having improved or repaired, or agreeing to improve or repair, buildings, or having executed or agreeing to execute on the land leased an improvement authorised by the Act, for or in connection with building purposes. A peppercorn rent or a nominal or other rent may be made payable for the first five years, or any less part of the term. Where the land is contracted to be leased in lots, the entire amount of rent to be ultimately payable may be apportioned among the lots in any manner, save that (1) The annual rent reserved by any lease is not to be less than 10s.; and (2) the total amount of the rents reserved on all leases for

the time being granted is not to be less than the total amount of the rents which, in order that the leases may be in conformity with this Act, ought to be reserved in respect of the whole land for the time being leased; and (3) the rent reserved by any lease is not to exceed one-fifth part of the full annual value of the land comprised in that lease with the buildings thereon when completed. These provisions remove the liability of each lot to bear the risk of breaches of the covenants attaching to other lots, and there will now be no difficulty in laying out an estate by means of building leases, and the several leases will be rendered more valuable.

Where it is shown to the Court with respect to the district in which any settled land is situate, either (i.) That it is the custom for land therein to be leased or granted for building purposes for a longer term or on other conditions than the term or conditions specified in that behalf in this Act or in perpetuity; or (ii.) that it is difficult to make leases or grants for building purposes of land therein, except for a longer term or on other conditions than the term and conditions in that behalf in this Act, or except in perpetuity, the Court may, if it thinks fit, authorise generally the tenant for life to make from time to time leases or grants of or affecting the settled land in that district, for any term or in perpetuity, at fee farm or other rents, secured by condition of re-entry or otherwise.

The chief building improvements authorised by the Settled Land Act, 1882, are the making or execution on, or in connection with and for the benefit of settled land, of any of the following works, and any operation incident to the execution of any of those works viz. (1) Drainage, including the straightening, widening or deepening of drains, streams and water-courses; (2) farm roads, private roads, roads or streets in villages or towns; (3) cottages for labourers, farm servants and artisans employed on the settled land or not; (4) farmhouses, offices and outbuildings and other buildings for farm purposes; (5) reservoirs, tanks, watercourses, pipes, wells, ponds, sluices, &c., and other works and machinery for supply and distribution of water for agricultural, manufacturing, or other purposes, or for domestic or other consumption; (6) streets, roads, paths, squares, gardens, or other open spaces for the use gratuitously, or on payment, of the public or of individuals, or for dedication to the public, the same being necessary or proper in connection with the conversion of land into building land; (7) sewers, drains, watercourses, fencing, paving, brickmaking, &c., and other works necessary or proper in connection with any of the objects aforesaid; (8) reconstruction, enlargement, or improvement of any of those works. In proposing a scheme for the execution of improvements, the initiative rests with the tenant for life. The contract for the execution of the improvements is made by the tenant for life. The trustees, acting in conformity with the regulations of the Act, are duly authorised and discharged. The tenant for life must submit the scheme for the approval of the Court, where the capital money to be expended in improvements is in Court; and after it has been approved the Court may make such order or give such directions as it thinks fit. In support of the application, there must be evidence of a report or certificate of the Land Commissioners, or of a competent engineer or practical surveyor to be approved by the Court. Three courses are open where the money is in the hands of trustees:—(1) They may apply to the Land Commissioners for their report or certificate that the work has been properly executed, and that a given amount is properly payable in respect of such work; (2) they may nominate an engineer or surveyor, procure the approval of his nomination either by the Commissioners or by the Court, and then act on his certificate or report; (3) they may apply to the Court for its direction and authority. When the improvements have been executed the tenant for life is subject to the direction of the Land Commissioners, who may make certificates as to maintenance and repairs, &c.

By the Settled Land Act, 1889, any building lease, and any agreement for granting building leases under the Settled Land Act, 1882, may contain an option, to be exercised at any time within an agreed number of years not exceeding ten, for the lessee to purchase the land leased at a price fixed at the time of the making of the lease or

agreement for the lease, such price to be the best which, having regard to the rent reserved, can reasonably be obtained, and to be either a fixed sum of money or such a sum of money as shall be equal to a stated number of years' purchase of the highest rent reserved by the lease or agreement. The price when received shall for all purposes be capital money arising under the Settled Land Act, 1882.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE usual fortnightly meeting of the Institute of Architects was held on Monday evening last, Mr. Alexander Graham, vice-president, in the chair.

The minutes of the last meeting were accepted as read.

The Chairman announced that the Council proposed to recommend that, subject to Her Majesty's gracious sanction, the Royal Gold Medal for the current year be presented to Mynheer P. J. H. Cuypers, of Amsterdam, for his works as an architect. Attention was drawn to the photos exhibited on the table representative of some of Mynheer Cuypers's buildings. His practice extended for over fifty years, and his works are to be found in all parts of Holland.

Arrangements were made for a party of thirty to visit Peterborough Cathedral to-morrow. The Council, however, passed the following resolution at the meeting of January 18:—"That the Council, having fully considered the matter of the restoration of the west front of Peterborough Cathedral, are of opinion that it would be inexpedient for the Institute to take any public action therein."

### The Sculptors' Architecture of the Renaissance.

Mr. Alfred Gilbert, R.A., said his remarks were meant to convey only suggestions. The subject of his lecture would appear to promise a critical view, but it seemed to him that this should be rather entertained by discussion.

Could those great men of the Renaissance hear all that might be said at that meeting they would be filled with wonder and delight at the pains they had inspired in us to reduce to theory the origin of their aims. There might be yet some concern at the thought that their most cherished gifts to us had been made out, explained and proclaimed to the world. In the days when those great men lived art was young in her rebirth. It was not an age of assertion but of endeavour, yet not tentative, but as decided as the handwriting on the wall. Therefore it held us, enchanted us, and allured us to inquiry. Surely we recognised in certain works the handicraft of certain individuals, the distinct work of a class of individuals who, though cunning with their tools, were yet not too friendly with the tee-square and set-square of modern days. That the results of their labours under such conditions should prove so splendid as to create in us a desire to study their methods was refreshing, not to say restful in these days of hurry.

Sculptor-architects, architect-sculptors: what was the difference? And yet there was a difference. Add the magic word Renaissance and the query was answered. The sculptor-architect of that period still survived, but the architect-sculptor—well, his existence was not really matter for their inquiry. He probably did exist, despite the fact that his efforts form less of a phenomenon than those of his brother craftsman. How came this so-called sculptor-architect into existence? At this period, despite a desire to create a national architecture, there seemed to have been little attempt on the part of architects to realise anything beyond a free revival or imitation of classic models. Examples were not lacking. The sculptors had fewer examples in their art, and indeed, the best they had were Greek or Roman productions. Sources of inspiration were open to all in the study of nature in all her suggestiveness. At that time the architects were hard at work as students of antiquity, whilst the sculptors were yearning, burning, in fact, to create and give to future generations a true impress of their own lives and time. Is it to be wondered at that the sculptor should long for license and liberty and a greater field for his invention, and that he should venture on the accompaniment of his own architecture? Thus greatly enlightened, he was led by his ambition to attempt the creation of the very forms he had been called upon to decorate, to govern instead of being governed. This, to his mind, constituted the real origin of the most remarkable phase of the history of the Renaissance since its inception, spreading as it did throughout Europe, and inspiring such works as were to be found in all the great centres of architecture. Since the influence of it was so great, he ventured to think that if more attention could be paid to the study of this subject much good would accrue and there would be some hope for the next generation. Art is not imitation but creation, and it recognises no specialties. This was realised by the men of the Renaissance, and it is not surprising that the striving to excel should become a passion, and that the ambition to build

palaces to adorn should have taken the place of the former contentment to ornament palaces already built—in fact, that the sculptor should aspire to place his work above the standard of decoration to the master adaptor, and furthermore to work on lines of his own. Thus far he had endeavoured to explain the existence of the phenomenal sculptor-architect, in order that they might more readily follow in the remarks as to his work. He was in no way prepared to hold for it the highest place as directed simply in the erection of edifices. It was rather in the treatment of ornaments that combine with purely architectural forms that he felt inclined to favour the sculptor in his dual capacity. He had been used to design and execute the ornament of buildings in which he had had no hand, and with which doubtless he often entertained no sympathy. He could realise that his ornament meant to his employer so much decoration, while to him it was the expression of an idea. Another qualification must not be overlooked, for it was very marked in the productions of the Renaissance, the period immediately following. It was the training they usually received in the art of the goldsmith. To this, no doubt, must be attributed the extreme freedom and that delicacy of execution, to say nothing of the appreciation of colour and light and shade which characterised their work. With such knowledge and practice of their craft, who can wonder at the result? He wished to emphasise a remark he had made earlier, and that was with regard to the desirability of the study by young architects and sculptors alike of the particular phase of the art of the Renaissance which was under consideration. Such a study could not fail to impress upon them that it was a duty every architect owes to himself, to his art and to his generation, that he should endeavour to place himself beyond a mere imitator, but rather he should go to the root of the flowers and learn to graft on the stem flowers as beautiful as the originals. It is the spirit of the age, not the letter, with which he should commune. He should worship it, and by bending himself to the application of its great influences endeavour to pass on to posterity a legacy further enriched by the print of his own time and individual adornment. Art is a very old republic, and to it had been given the elixir of life—that secret which has been denied to man. It is as young to-day as it was centuries ago. Its existence was at once retrospective and progressive. Its every movement forward is the reflection of past ages. Its every act was a mere reflection. Its future was written in the mystic word tradition—a word which, with its mighty significance, would ever remain to assist art in its onward movement. It was in the spirit and traditions of art's great principles that we must be governed. We can hope to hand on the important legacy we inherited from men who were far more than mere specialists.

The Chairman hoped the very charming lecture, which had only one defect, that it was far too short—they had quality, not quantity—would lead to a lengthy discussion.

Mr. Alma-Tadema, R.A., considered the remarks most interesting and full of theories of the highest aim which had made him dream of the beauties of the Renaissance and the revival of the antique, without disturbing their general admiration of the beautiful things in the light of which they were daily feasting and from which they daily profited in their art. He said he felt very proud in proposing a vote of thanks to Mr. Gilbert.

Mr. J. M. Brydon thought they had arrived at some progress when such a subject as the Renaissance was discussed by the Institute. It was only a few years ago when Renaissance work was considered a thing to be scouted by purists. But they ought to have looked on it with lenient eyes as something that came after Gothic. There were one or two names which stood out as sculptor-architects, such as Michel Angelo and Sansovino. The former was not the greatest of the Renaissance men, but he looked upon architecture from the decorative point of view. The characteristic of his work was decorative. Referring to the staircase of the Laurentian Library, Mr. Brydon thought the steps were most sumptuous, although they were not quite as Michel Angelo left them. Another one of the things he did was to save the façade of the Farnese Palace at Rome. When Michel Angelo was called in after Sangallo's death, he designed the magnificent cornice which saved the building from being commonplace, and brought the whole structure into harmony. It was constructive as well as decorative work, and he clothed it with beauty. It was to be hoped they were getting back to the day when sculptors and architects would not feel a building was great unless they worked together. He desired to join heartily in the vote of thanks, and had pleasure in seconding it.

Mr. Beresford Pite said some of them regarded Mr. Gilbert in a peculiar light with regard to this subject, and the very person to put them right in their views. The architect suffered from a complaint with which the sculptor was not afflicted. The architect was fettered by facts, lines, orders, plans and by constructive circumstances. He could not get free of his traditions. The sculptor suffered from a loss of these afflictions. He had to create an ideal out of nothing. As archi-

jects could they not take up with zeal the sculptors' tools and work with them? As a record of beautiful building, which could not be attributed to any one school, he thought the Science School at Kensington, by Alfred Stevens, was most interesting.

Mr. H. L. Florence was struck by the great analogy of the architecture and sculpture of the Renaissance. In the early days the lines of the sculpture were purely architectural, but in later times there was a period which deteriorated. Bernini was a great artist in a florid way, but he was the commencement of a period which led to degeneration.

The Chairman considered the great fault of the work of modern times was that one knew exactly where the architect left off and where the sculptor came in. The London University building in Burlington Gardens was a fair example of such a structure which had been carried out as originally designed.

Mr. Gilbert, in reply, thought it would have been better had a second thought been entertained with regard to the construction of the London University. The very essence and training of a sculptor was more with the sense of imbuing than with the idea of constructing. The structure of the building was contained in very little. It was the sculptor's task to master construction; whereas the architect had, so to speak, a log-book to fall back upon. The sculptor had no book, where it was worked out for him; he had only one principle—plumb. The sculptor could begin at the top and work down; but the architect must start from the bottom and work up.

It was announced that the next meeting would be held on February 15, when Mr. H. E. Milner would read a paper on "The Garden in relation to the House."

### CONTINENTAL PAINTING.

AN address was delivered on Saturday last at Stirling by the Earl of Moray at the opening of the exhibition of the Stirling Fine Art Institute. His lordship said he was not a distinguished connoisseur of paintings as was the late Sir William Stirling-Maxwell, who opened their first exhibition, and who was well known as a man of art and genius. He felt he was somewhat out of his element in such a gathering, in such a building, with so many of the citizens of Stirling about and around, and that brilliant display of pictures hanging on the walls; but he would just say a word or two, and hope it would not damp or discourage them in any further exhibition or effort of the kind it might be their intention to carry out. As they were aware, their own country was not the home of painting—they could hardly consider it indigenous—and he would say a word or two about the paintings existing in previous ages, and in other countries than Great Britain. The art of painting stretched far back into the Middle Ages, and even before what they generally called the Middle Ages there was a school of painting in the ancient cities of Greece, and sculpture was also carried out there to a great extent, as well as in Rome and the east of Europe; and it was the good fortune of those who inhabited the countries washed by the Mediterranean Sea to be placed where, from the physical circumstances of those countries, painting had its rise and origin. While on his way to Stirling that afternoon he thought of the contrast between that wintry day in the end of January and those perpetually bright days which the inhabitants of those countries—Italy and Greece—experienced, where the people lived in constant sunshine, and lived all their days, as it were, in the open air. Everything was open, easy and delightful for the encouragement and carrying out of painting, and he thought what a contrast they had here. Yet they saw that even in this country, in their own beloved Scotland, painting had grown and was growing. It was taking a greater hold upon the thoughts and education of the people, and that was in a considerable degree due to the excellent facilities that now existed for travelling from this to other countries, and seeing the works of the great masters. Many a family now went abroad for two or three weeks at this time, who would not have gone thirty or forty years ago. After getting the new year over, and settling up their accounts, they went away to the south of France—to Cannes, or perhaps Genoa or Florence, where there had been distinguished schools of painters, whose works remained to testify to the results they attained, and the position they occupied in their own country. Owing to the improved facilities for travel, the people of our own day and generation have been brought into closer contact with those works of art. They could go out there and make purchases, or bring back sketches or reproductions in the shape of photographs of those pictures and scenes they visited, and show to their friends the works of the Italian, the Dutch or the Flemish schools. Some people had a taste for one kind of pictures and some for another. One could go over to Holland and see some of the galleries of The Hague and Amsterdam and the Dutch and Flemish schools, where they found such works as those of Rembrandt and Franz Hals and men of their time and type. The pictures of that age

were very striking and were always included in the galleries of large cities. The growth of painting had gone steadily on, and all the paintings they saw round these walls were the works of modern artists. This country, they could not but admit, was well adapted for the education, upbringing and perfecting of the works of those who painted in oils and water-colours such beautiful and interesting specimens of scenery as were within the reach of Stirling. He had the pleasure of a look round the galleries before the proceedings began, and he could not but congratulate them on the splendid exhibition he had now the pleasure of declaring open. He hoped the result would be encouraging to the Association, and that they would have many such exhibitions in the future.

### GERMAN GOTHIC ARCHITECTURE.

A LECTURE was delivered by Professor Meissner, Ph.D., at the Belfast Art Society, upon "German Gothic Architecture of the Fourteenth Century." German architecture of the fourteenth century owed, he said, some of its character to the rivalry which existed amongst builders of churches with regard to the towers. The position of the architect and the peculiar circumstances of his calling differed from those of the painter, the sculptor, or the musician, for the latter were able to proceed at once with the work which had been conceived in their minds without incurring anything beyond nominal preliminary expenditure, whereas the architect required an almost unlimited supply of money before commencing operations. He was also handicapped by other circumstances—for instance, the place where the building was to be put, the surroundings, &c. The almost general use of brick in connection with German architecture was explained by the fact that the whole of the lowlands of the country produced no stone, consequently the other material was brought into requisition. It had also been found much more easy to construct the arch with brick than with stone. They might go throughout the length and breadth of Northern Germany and find nothing but brick churches, and they would not find a single church with a wooden roof; while, on the other hand, in many districts in England they found where stone was plentiful Gothic churches were built with wooden roofs. The Professor went on to allude to the use of brick in the North of Ireland, mentioning that a great deal might be done with a very slight outlay to make the buildings more ornamental and artistically beautiful. The lecturer next described the great cathedral at Cologne, which he said had always been looked upon as the St. Peter's of Germany. The original plans of the cathedral were lost, and after the building of the old cathedral in 1248 the present cathedral was begun and was only finished in 1880, so that 532 years were spent in the erection of this edifice. Between 1820 and 1825 a great enthusiasm spread throughout Germany in the direction of having the cathedral completed, and for that purpose collections were made throughout the country. Not only were these collections supported by Christians but were also liberally contributed to by the Jews. Having detailed the interesting story of the discovery of the plans and other details in connection with the carrying out of this immense undertaking, he stated that the original idea had been that the design was the product of one brain; in other words, that it had proceeded from one genius, as Minerva sprang from the head of Jupiter. But recent investigations had shown that three, if not four, architects had to do with the plans which had been followed in the building of the cathedral, which (as he had already suggested) was the great national temple of Germany.

Mr. William Gray expressed his agreement with the suggestion made by Professor Meissner as to the desirability of their relieving the monotony, if not the positive ugliness, of the brick buildings in Belfast. He hoped the result of that suggestion which he had thrown out would be that they would see an improvement effected in this direction in connection with local buildings.

### THE BOADICEA GROUP.

IN December last the London County Council received an offer from Mr. W. J. Bull, one of the members, to defray a portion of the expense of casting a model of a group of Boadicea by the late Mr. Thornycroft and erecting it in London conditional upon the Council contributing not more than 1,000*l.* The Council, having no power to incur expenditure for such a purpose, passed a resolution instructing the parliamentary committee to take the necessary steps for a clause to be inserted in one of the Council's Bills, empowering the Council to purchase or contribute towards the cost of purchasing, or incur expense in connection with the provision and erection of works of art in London. The general purposes committee now report that a further letter has been received from Mr. Bull to the effect that the Boadicea fund committee are anxious to have the statue erected this year, and that Mr. J. I. Thornycroft, the son of the

sculptor, who has offered to present the group to the Council will give an order at once for the casting of the model and pay the money as and when required, he relying upon the Council to repay him if and when it obtains Parliamentary powers, or upon further subscriptions being secured, or finally standing to any eventual loss if the Council does not contribute. The committee, while thinking this a generous offer on the part of Mr. Thornycroft, consider that, as in the ordinary course the necessary power for the Council could not be obtained for eighteen months, it would be inexpedient for the Council to accept at the present time any liability whatever in the matter. They accordingly recommend the Council to pass a resolution asking Mr. Bull to convey to Mr. Thornycroft the thanks of the Council for his liberal offer in connection with the Boadicea statuary group, but at the same time to inform him that the Council was not in the position to contribute towards the cost of casting the model of the group or to bind itself to do so later should Parliamentary power be given for the purpose, and that, while the Council would proceed to promote the Bill, it must be understood that any steps which Mr. Thornycroft might take in the matter were entirely on his own responsibility.

### THE LISKEARD TOWER COMPETITION.

A MEETING of the church tower committee was held in the vestry of the parish church, Liskeard, on January 29, when reports on the competition plans of the tower and a supplementary report as to the condition of the tower were presented by Mr. Edmund Sedding, of Plymouth. That gentleman stated that of twenty-five sets submitted he had selected three for final consideration, and had come to the conclusion that the set submitted by Moorstone (there were two sets with the same motto) be adopted. His decision referred to the design which incorporated the interesting old features of the present tower, and also showed a south vestry (No. 20). The design with the motto Trecarrel he had accorded second place (No. 19). Of the total number of designs submitted he considered that several were worthy of merit.

In Arte et Manu, No. 4.—Design good, but too modern for an adjunct to an old church.

A. C. H., No. 8.—Exhibits some knowledge of Cornish work, but out of keeping with Liskeard Church.

A. K. B., No. 9.—Shows evident appreciation of old work.

Ready, aye, Ready, No. 12.—Would have been placed higher, but the design is marred by the large middle window.

Design in beauty, build in truth, No. 14.—Has somewhat grasped the Cornish character, but his heavy pinnacles are out of keeping altogether.

Design in beauty, build in truth, No. 15.—Clever design, but too conventional as an adjunct to an old Cornish church.

Moorstone, No. 16.—Able design, with Somersetshire feeling.

Resurgam, No. 17.—Shows careful conservative feeling, but the tower is too squat; it resembles the old Essex work.

Trecarrel, No. 19.—A very pleasing design, which, but for the costly enrichment and the narthex in front of the west doors, might have won first place.

Moorstone, No. 20.—Placed first (under conditions).

Mr. Sedding recommended the adoption of a compromise between Moorstone's main design and his alternative scheme; that the height should not exceed 80 feet; that all the old features of the present tower be reused, of course including the old tower arch—in short, that a scheme of rebuilding be aimed at rather than a demolition of the existing structure. There were many parts of the old fabric that might well be utilised for the new building that it would be unwise to discard, if only for the archaeological interest that they afforded, for it would be a lasting discredit to the town were they suffered to be destroyed. He referred to much of the old stonework that might be utilised for outside facing, with some weatherings and other moulded work, placing all the old at the lower part of the tower. This would help the committee in the cost and materially add to the interest of the new structure. The successful competitor should be restricted to these conditions, or an interesting old landmark would entirely vanish.

The first premium was obtained by Mr. John Sansom, of Liskeard (Moorstone); and the second by Mr. H. P. Burke-Downing, of Great College Street, Westminster.

On January 29 Mr. Sedding informed the committee that he had carefully examined the existing structure. The gaping cracks through which a hand might be thrust, although so apparent on the inside, were far less discernible on the outside, owing no doubt to their having been externally repaired in past times. The tower was rent in various directions by these cracks, apparently in consequence of defective foundations. The fabric dated from the twelfth century, but had been altered from time to time. The interesting arch was, in his opinion, of two dates, the responds being the original Norman, their leaning lines being a corroboration of that opinion, whereas the arch

was depressed and pointed. This he attributed to some half-century later. Probably this arch was rebuilt, it may be owing to the same mischief as that with which the committee now had to deal. They should, however, notice that the later workmen reintroduced the same old material, redressed, of course, to suit the altered shape of the arch. The twelfth-century windows were now in danger of having their outer facing completely detached from the inner, there being apparently no bond to keep the two facings together. The seventeenth-century mask of granite, with the west door, extended to about one-third of the height, and only half-way, more or less, along the sides of the tower. The battlements were of this date. The height of the tower was 60 feet. There could be no doubt whatever that the present structure was in a precarious condition, and should be promptly prevented from further dislocation, which would cause the fabric to collapse. It was, he understood, the desire of the committee to heighten the tower some 20 feet, as suggested by the successful competitor. This could not be done with safety without strengthening the substructure, which was now unable to support itself. Any methods, far short of rebuilding, would be but temporary, for the tower needed a foundation. Under the circumstances he should not recommend underpinning, for it would be attended with considerable danger. The only alternative—and, in the end, the most conservative method—would be (as Mr. Pearson is doing now at Peterborough) to rebuild, carefully preserving and marking the old materials, so that the present tower might be re-erected as far as it could be done, and new walling stone being in harmony with the old. The seventeenth-century granite facing to be used in the lowest part, with the old plinths. He was quite sure the committee could have no better man than their chosen architect to carry out this most important work, which, if accomplished on the foregoing lines, would be one of the most interesting pieces of conservative craftsmanship executed in this county.

### THE ARTISTS' CORPS.

ON Monday last the regimental prizes of the 20th Middlesex ("Artists") Rifle Volunteers were distributed at the headquarters of the corps in Duke's Road, Euston Road. Among the large number of officers present were Col. Edis, V.D., F.S.A., the commanding officer, Lieut.-Col. Bruce, Majors Horsley, Davidson, Duffield, White and Lamb (the late adjutant), and Capt. Annesley (the present adjutant), Col. Somers Lewis (4th Middlesex), Col. Balfour (London Scottish), Major Neil, of New South Wales, Col. L. Pott (17th Middlesex), Col. Grey (2nd South Middlesex), and Col. Barrington Campbell (Scots Guards), commanding the South London Brigade. Major Davidson presented the annual report, which showed that the regiment had increased in numbers from 741 in 1895 to 818 in 1896. Col. Edis expressed his regret that the Commander-in-Chief, who was to have distributed the prizes, was unable to be present. Lord Wolseley had sent him the following letter:—"War Office, London, S.W.: February 1, 1897. Dear Col. Edis,—It is a real disappointment to me that I am prevented from being the guest of the Artists' Corps this evening. Long confinement to the house has reduced my strength, but I am daily picking up now and hope to be about as usual very shortly. Pray remember me very kindly to all my friends in your battalion, and believe me to be, sincerely yours, WOLSELEY." Mrs. Barrington Campbell handed the prizes to the successful competitors. The Brigadier, in the course of a few remarks, said that, in his opinion, there was no regiment more efficient than the Artists. He hoped the volunteers would soon be provided with better firing ranges.

### NORTHERN ARCHITECTURAL ASSOCIATION

THE seventh annual social gathering and exhibition of sketches of the Students' Sketching Club in connection with the Northern Architectural Association took place on the 26th ult. at the Grand Assembly Rooms, Barras Bridge, Newcastle. Mr. Jos. Oswald occupied the chair, and there was a large attendance. The Chairman during the evening presented the prizes to the successful students in the competitions held during the summer. Mr. S. M. Mould was first for the measured drawings and Mr. B. Procter second, whilst for sketches Mr. H. Raine was first and Mr. S. M. Mould second. An election of members, associates and students resulted in unanimous voting for Mr. H. G. Badenoch and Mr. J. Bruce as members, Mr. S. M. Mould, Mr. R. P. S. Twizell and Mr. G. Brumell as associates, and Mr. C. W. Milburn and Mr. T. C. Weatherall as students. This concluded the business of the meeting, and then the musical programme, which was of a more ambitious character than heretofore, was proceeded with. For the next competitions Mr. Glover has offered two additional prizes for sketches or drawings.

## NOTES AND COMMENTS.

A RETURN has been prepared by the Science and Art Department, but not yet published, which shows how local authorities are devoting the residue obtained under the Act of 1890 as well as the sums derived from local rates to education. It appears that thirty-eight out of the forty-nine county councils in England (excepting the county of Monmouth) are applying the whole of the residue to technical education, and eleven a part of it; and that of the sixty-one councils of the English county boroughs, fifty-four are devoting the whole and seven a part to the same purpose. The councils of thirteen county boroughs, sixty-seven boroughs and 109 urban districts in England are making grants out of the rates under the Technical Instruction Acts. In several cases local authorities are also devoting funds with the same object out of the rate levied under the Public Libraries' Acts. The thirteen county councils and the councils of the three county boroughs in Wales and Monmouth are applying the whole of the residue to intermediate and technical education. Further, the councils of eleven counties and county boroughs and twelve boroughs and urban districts in Wales and Monmouth are making grants out of the rates, and one local authority is devoting part of the public libraries' rate to technical education. The total amount expended on technical education during the year 1894-95 in England and Wales was 697,273*l.* 3*s.*, and the estimated total expenditure during the year 1895-96 was 754,253*l.* 15*s.* 11*d.* In addition, the following sums were raised (by twenty-five local authorities in each year) by loan on the security of the local rate, mainly for the erection of technical and science and art schools, viz. in 1894-95, 119,258*l.* 15*s.* 2*d.*, and in 1895-96, 152,000*l.* 19*s.* 1*d.* The estimated total amount to be devoted annually to intermediate and technical education in Wales and Monmouth is 42,861*l.* The total amount expended on technical education during the year 1894-95 in Scotland was 36,366*l.* 14*s.* 6*d.*, and the estimated total expenditure during 1895-96 was 35,035*l.* 17*s.* 10*d.* In Ireland no part of the residue under the Act of 1870 is allowed to be applied to technical education, and the grants which are doled out by the Science and Art Department are an inadequate compensation. In consequence the expenditure in 1894-95 was only 4,169*l.* 7*s.* 10*d.*, and the estimated expenditure for 1895-96 was 4,218*l.* 3*s.* 10*d.*, or less than an eighth of the amount available in Scotland.

CATALOGUES are not always prized by the uninitiated. For that reason it is right that attention should be drawn to the peculiar value of one by Sir A. W. FRANKS, describing "A Collection of Continental Porcelain," lent by him to the Bethnal Green Museum. The author's knowledge is comparable to his generosity, for Sir A. W. FRANKS appears to have mastered all varieties of connoisseurship and to be able to obtain possession of any sort of treasure he may desire, but he either gives away or lends his most prized specimens. The "Continental porcelain" now described is not his earliest collection and does not entirely consist of the finest specimens, but it is, as he says, "documentary," and is, therefore, of more interest to students and collectors than one more costly. It contains examples of German, Dutch, Danish, Swedish, Russian, Belgian, Swiss, French, Italian, Spanish, Portuguese and Turkish porcelain. Sir A. W. FRANKS gives twenty pages of inventors' marks and fifteen pages of engravings of them. So genial an author could not confine himself to the preparation of lists. It is interesting to learn that a little bust of the Emperor VITELLIVS, produced at Meissen, is declared by some experts to be a portrait of the great potter, J. F. BÖTGER, the creator of porcelain in Saxony. A specimen of Sèvres, although without the official mark, presents a portrait of C. J. Fox, with laudatory verses in English, thus showing the esteem in which the Whig leader was held in France. A Meissen plaque has a copy of JOHN FLAXMAN'S "Apotheosis of Homer." VOLPATO'S name is memorable for unsurpassed engravings in line, but it appears that in 1790 he set up a porcelain factory in Rome. The one specimen possessed by Sir A. W. FRANKS—a pastille burner of white biscuit—once belonged to M. DIGBY WYATT. Among the suggestions for the guidance of collectors is one relating to Meissen porcelain. Pieces made in the factory are decorated outside it by "chambrelans," or chamber-masters.

When the porcelain is sold in the white state a cut is made across the crossed swords, which form the mark of the factory, and if there are considerable defects in the piece two or three cuts are made; where such cuts occur it is certain the decoration was not painted in the royal factory. Considering the limits, it would be difficult to find a safer guide than the catalogue.

THE War Office contemplate the expenditure of large sums on building. The Military Works Bill shows that a further sum of 150,000*l.* is to be devoted to works at the Royal Barracks and Military Hospital, Dublin; besides 165,000*l.* for new cavalry barracks to replace the Island Bridge Barracks in that city; 18,000*l.* is put down for the provision of a military hospital at Edinburgh; 66,000*l.* for the completion of the infantry barracks at Parkhurst; 143,000*l.* for the provision of a central military hospital, Army Service Corps Barracks and married soldiers' quarters on the site of Millbank Prison, London; 66,000*l.* for the reconstruction of the existing barracks for the Royal Horse Artillery and the Royal Artillery at Newbridge; 88,000*l.* for the provision of infantry barracks at Pembroke; 39,000*l.* to complete the reconstruction of the citadel for artillery at Plymouth; 72,000*l.* for the replacement of Winchester barracks, destroyed by fire in 1895; 66,000*l.* for the conversion of the female prison at Woking into barracks for the Royal Artillery; and 20,000*l.* for the replacement of wooden huts at sundry stations. In addition, 150,000*l.* will be assigned to the continuation of replacement of huts in permanent material and provision for lighting the military buildings at Aldershot; 220,000*l.* for similar work at the Curragh, 165,000*l.* for the same purpose at Colchester, and 115,000*l.* at Shorncliffe. Of the 247,000*l.* to be expended on foreign stations for accommodation of increased garrisons and improving barrack accommodation at fortresses, 67,000*l.* is to be spent at Bermuda, 64,000*l.* at Gibraltar, 13,000 at Halifax and 103,000*l.* at Malta. Of the 846,000*l.* intended for the accommodation of increased garrisons and improving barracks accommodation at Imperial coaling stations, 160,000*l.* is for the Cape of Good Hope, 11,000*l.* for Ceylon, 133,000*l.* for Hong Kong, 29,000*l.* for Jamaica, 169,000*l.* for Mauritius, 260,000*l.* for St. Lucia, 25,000*l.* for St. Helena and 59,000*l.* for Sierra Leone. The 5,458,000*l.* proposed by the Bill is to be distributed as follows:—Defence works, 1,120,000*l.*; barracks, including completion of large camps, 2,989,000*l.*; ranges, including accommodation for manœuvring and mobilisation, 1,149,000*l.*; staff and contingencies, 200,000*l.*

WOOD-CARVING is again coming into fashion. The support given to it by county councils and other dispensers of public funds is easily to be understood. The art is one which can retain the humbler classes in their homes, and temperance and allied virtues will, in consequence, be promoted. For humble amateurs who cannot be considered as endowed with much talent for sculpture, Gothic models are more easily imitated than Renaissance, because more aid from geometry is obtainable in determining the outlines. The large plates which are found in "Details of Gothic Wood-carving," by Mr. FRANKLYN A. CRALLAN, late instructor in wood-carving in the Derby Municipal College (published by Mr. BATSFORD), are admirably adapted to serve as models for students of the class we have mentioned, and who have not opportunity to study work in the solid. The examples are selected from fourteenth and fifteenth-century work, and they are represented by shaded chalk drawings with strong outlines of details. All are drawn to scale and are so definite, there is nothing to puzzle a beginner. There is still a sufficient demand for Gothic furniture to reward a student who can reproduce geometrical patterns, and a copy of Mr. CRALLAN'S examples would be likely to become a profitable investment for an industrious workman.

## ELY CATHEDRAL.—II.

*Transition Period.*

MEANWHILE, however, a great change was coming over the prevalent architecture. We see it foreshadowed by the greater richness of this western transept (in its lower storeys); we see it carried on in the highly refined Norman work of the beautiful ruined infirmary, but these are still Romanesque and round arched. By the time, however, that Bishop Ridel undertook the completion of "the new work towards the west," the change had proceeded much further and the Pointed arch, with many of its accompanying details, had been introduced.

Bishop Ridel held the see from 1169 to 1189, a space of time comprehending nearly the whole period of this great architectural transition in England. In France the movement had commenced earlier, as we see from Abbot Suger's work, both at the east and west ends of his church at St. Denis, and from the contemporary work in the west front at Chartres—all dating from about the middle of the century. In England we find it foreshadowed from about the same time at St. Cross and in many other works, but the change was rendered more definite by the appointment of William of Sens, in 1175, as the architect for the rebuilding of the eastern part of Canterbury Cathedral after the great fire there. This work, continued by his disciple William the Englishman, was finished in 1185, and the work of the English architect, which was not influenced by the remains of older work, carried on the style to a perfected form in its earlier phase. After this, though we find the use of the round arch, with reminiscences of Norman ornament long lingering in English work, the style may be said to have been essentially changed.

The new style evinces, more I think than that of any other period, a determined resolution to refine every detail, to bring workmanship to perfection and to advance architecture in every way. The upper stage, or possibly the two upper stages, of this western transept, with the whole of the western tower (except, of course, the octagon stage) are of this period, and may be viewed as a Transitional work, carried on probably at the same time with that at Canterbury, but under English rather than French influence; it is a work of great vigour and beauty, the pride of Ely, so far as its earlier architecture is concerned.

Whether the western transept was completed on its northern side has been questioned. My own conviction is that it was so. In the first, I do not see why the architects, &c., who had conceived so noble an idea should, while carrying it on during two generations, have been content to leave one of its wings, so essential to its beauty, unbuilt; in the second place, I do not believe that anyone would have had the temerity to carry up so vast a tower, buttressed well on three sides, but unbuttressed on the fourth; thirdly, I do not think that Ridel would have been recorded to have "finished the new work towards the west" had he left so essential a feature untouched; and finally, the portions of the north transept attached to the tower and corresponding in design with those on the south, seem to suggest that the whole was carried up together. The details of a different character, which we see combined with these, are so late in date as not to affect the question.

I conceive that the great western tower, when first finished, was covered by a form of timber and leaded spire, which subsequently became frequent in the neighbouring marshlands, a vast octagonal pyramid, surrounded by four of smaller size rising from their turrets at its angles.

Such a spire still remains at St. Mary's, Sutton; such must clearly have terminated the beautiful detached tower at West Walton; such I think existed at St. Margaret's at Lynn, and probably at several of the neighbouring churches, and all these, as I imagine, followed the great type first established at Ely, either by Bishop Ridel, or in the next century by Bishop Northwold. The front, with its tower thus terminated, with leaded spires also on the four terminal turrets of the transept, and with the high roofs on the transept and the western porch, must have presented a *tout ensemble* of the most imposing and majestic character.

Bishop Ridel is also recorded to have done much in adorning the interior by painting. There can be little doubt that the painted decorations of one bay of the south aisle which yet remain and are of exquisite beauty, though unhappily fast fading away, were a part of his work. Such may also be the case with those in one or more of the chapels of the great north transept, and with others whose traces are still visible in many parts of the Norman work.

*Early English Period.*

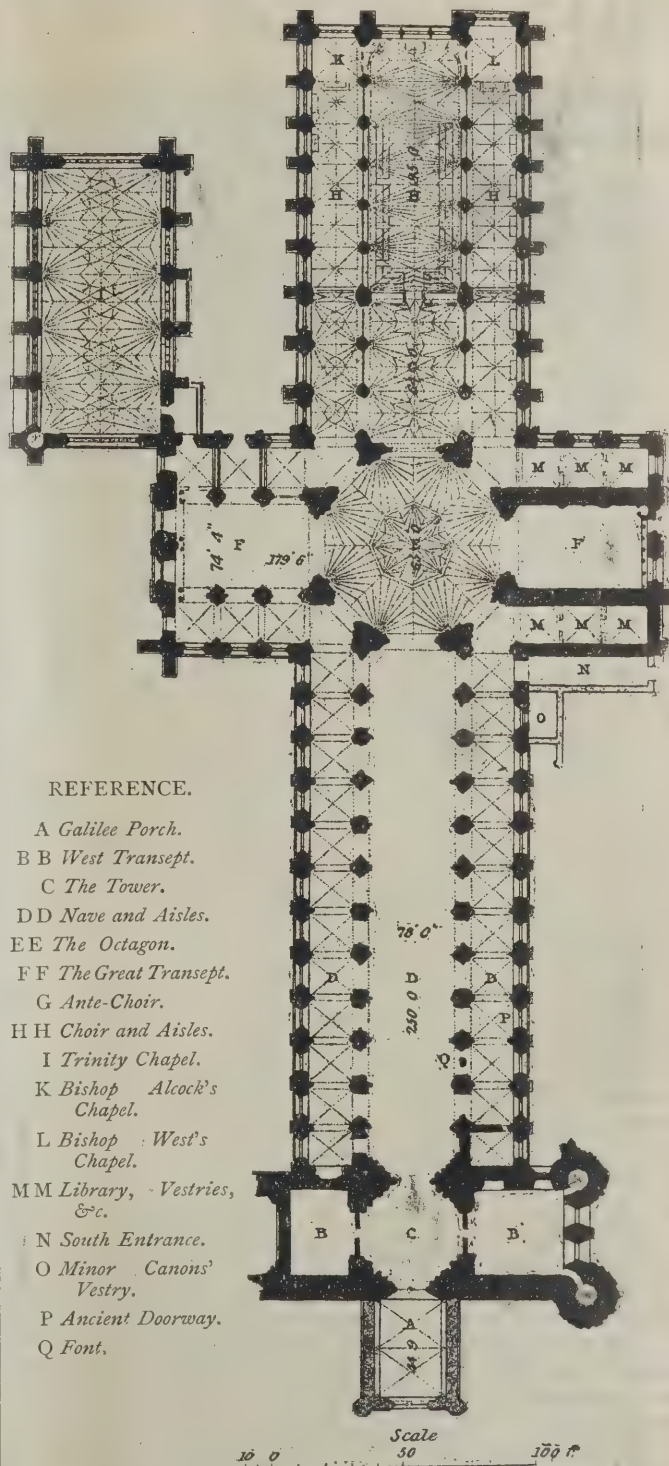

After Ridel the see was held for some eight years by Bishop Longchamp, who did nothing to the cathedral.

He was succeeded in 1197-98 by Bishop Eustace, of whom it is recorded that "he built from the foundation the New Galilee of the church at Ely, towards the west, at his own cost."

Now this has given rise to much difference of opinion.

Some think that by the "Galilee towards the west" is meant the western porch, while others, holding that so fine a work is inconsistent with so early a date, suppose the Galilee to have been the northern half (now lost) of the western transept.

The term "Galilee" might probably be applicable to either. It was (as I believe) a part of the church in which dead bodies might remain while awaiting interment, to which processions were accustomed to make their return and in which women might meet such of the monks as were their near relations. It was the equivalent of the narthex of the ancient church—a sort of court of the externs—a "Galilee of the Gentiles," and the form of consent for a woman to see her relative who was a monk is said to have been "Behold, he goeth before you into

Galilee." The Galilee at Durham was more than a porch; it was an extensive chapel, probably because of the unusual strictness in St. Cuthbert's Abbey with reference to women while at Lincoln it seems to have been an open porch to the west of the great transept. At Ely it might either be a porch or a chapel.

My own impression has always been that it was the west porch which still exists. I will first mention that in one of the ancient records the west tower is described as being towards the Galilee, "*versus Galileam*," an expression which would seem to point to the Galilee as being an advance of the tower. To the argument that the work is too refined and advanced for the period (a formidable argument, I admit), I would reply

that from the death of Ridel, who had been working in Pointed architecture, to the death of Bishop Eustace, there was an interval of twenty-six years, sufficient in those days of most earnest pressing onward to account for a very great advance, and it is possible that Eustace (if he built the porch) may have done so towards the close of his life, or even have left it to be completed after his death. Let us inquire what was the character of the works of this critical period.

I will first instance the works of St. Hugh at Lincoln, which I think Professor Willis agreed embraced the parts lying between the great transept and the presbytery, including both the eastern transept and, as therein found, a part of the east side of the greater transept. This work, though of early character, is fully-developed Early English. Its abaci are

generally round, and though its arch mouldings retain a form which had been suggested by a square abacus, they are of a character peculiarly refined and studious in their profile; indeed, I may say of the whole that it is more refined and more carefully studied than the much later work of the nave, attributed, I believe, to Bishop Grosseteste. Now, the whole of this work is supposed to date previously to the year 1200. Again, Professor Willis has, I think, attributed the eastern chapels at Winchester to Bishop de Lacy, who died in 1204. These no one would distinguish from other developed Early English works.

Lastly, we have the fullest documentary evidence given us by Matthew Paris of the dates of the western portals and adjoining parts at St. Albans.

*Photographed by S. B. Belas & Co.*

ELY CATHEDRAL, VIEW OF CHOIR.

These were built by Abb6t John de Cella, between 1195 and 1215. He records minutely the abbot's earnest but abortive attempts to raise funds, his failure to raise the work above a certain height, his relinquishing it in despair several years before his death in 1215, its resumption by his more business-like successor, William of Trumpington, his cutting down the details to a plainer scale, omitting or curtailing the use of marble, &c. And all this we can trace out to this day in the design as it exists. The work to a certain height is richer than above; the use of Purbeck marble is curtailed; columns having bases and annular bands for eight shafts have capitals only for four, the remaining bands being broken off as useless. The proof is perfect, showing the more ornate work to have terminated some years before 1215; yet the character of the work is fully developed, having no trace of Transitional feeling, and is in every way better and more refined than the later work of Trumpington. The work in the west porch at Ely is, of course, later in its mouldings than that at Lincoln, having fifteen more years to deal with. It is, I think, a little later than that at St.

Albans, but it still has a few more years to play with, De Cella having given up his work in despair, while Eustace may have continued his till his death; but the character of the capitals at Ely and St. Albans is identical, while the portals at both are among the most exquisite Early English works which we possess.

Having offered these arguments I leave the question open. The fact that Northwold's much later work is (if anything) less refined I submit to be only parallel to the similar differences between that of Grostete and St. Hugh at Lincoln, and between that of Trumpington and De Cella at St. Albans; indeed, I would appeal to those who have given most study to the subject whether they have not often found greater and more studious refinement in even clearly Transitional work than in fully-developed Early English.

We now come to the great work of the thirteenth century—Bishop Hugh de Northwold's magnificent extension of the eastern arm of the church, one of the noblest pieces of architecture of that glorious architectural period.

Photographed by S. B. Bolas & Co

ELY CATHEDRAL, NAVE FROM OCTAGON.

This great work was commenced in 1234 and finished in 1252.

The Norman apse, or its substitute, at the east end was taken down and six bays with a magnificent eastern façade added. The work cost what in our money would be equal to 100,000*l*. I will not dwell in detail upon this work as it is before your eyes, and no controversial question arises respecting it; I will mention, however, that its design was in some degree influenced by that of the Norman presbytery, of which it formed a continuation. Hence its triforium storey is unusually lofty and had an external wall with beautiful windows of its own. A like fatality has happened externally to both the Norman and the Early English triforium; their walls have been so transformed that their original design would be unintelligible had not a single portion of each been happily left untouched, viz. the two bays of the Norman wall east of the north transept and two bays of the Early English wall on the south side of the presbytery. From these a restoration on paper of nearly the whole cathedral, so far as relates to its bays, whether Norman or Early English, could be laid down.

The new work was magnificent in all its details, profuse in the use of Purbeck marble, and noble in every portion of its design.

I do not recollect any other important work of the thirteenth century in the cathedral, excepting the windows of the eastern chapels of the south transept, which are beautiful specimens of the style of the later part of the century, contemporary as it would appear with what remains of the refectory.

I now proceed to the two great and famous productions of the fourteenth century, the two special objects of pride which our cathedral boasts, the lady chapel and the central octagon, with the three adjoining bays eastward.

These works are to Ely what the rebuilding of the choir was to Canterbury. Each work forms the great central fact in the history of its church; each work is of the highest and of undisputed merit, and forms the most marked feature in the building; of each the architect and his history is known, and of each the history and progress of the work are carefully recorded. The erection, too, of the great octagon, like that of the eastern arm of Canterbury, was the result of a great and notable catastrophe.

In 1321 the foundation-stone was laid of the vast and magnificent lady chapel. Its position, running parallel with the choir and corner to corner with the north transept, was peculiar, and was probably suggested by that already erected in a somewhat though not precisely similar position at Peterborough. Both were parallel to the choir, and both had entrances from the choir aisle, but as the chapel at Peterborough darkened three of the chapels, the Ely lady chapel was placed further north, so as to leave the windows of the transept chapels unobstructed. The size was enormous, being externally more than 100 feet by 50. The first stone was laid by Alan de Walsingham, then the sub-prior, who no doubt had designed the building, and perhaps, if he cared for artistic fame, may have rested satisfied to trust for it to this noble work, little thinking that the following year would place at his command so much more notable a foundation for future celebrity.

The cathedral had now had two periods of glorious completeness.

When Bishop Ridel had completed his western tower and façade, it became a perfected Norman structure of the first order, not to be surpassed in grandeur and beauty by any of its compeers. When Eustace (perhaps) had added his gem of art to the western entrance, and Northwold his majestic presbytery at the east, the structure, though less unique in character, had become more replete with architectural beauty, but this completeness was destined to be rudely broken into by the misfortune now to be recorded, although it did but make way for new glories.

## THE ARTISTIC TREATMENT OF HERALDRY.\*

IN laying before you this evening a few suggestions on the artistic treatment of heraldry I assume that most of those present have some idea what heraldry is, and are sufficiently acquainted with the rudiments of the science to justify my passing over such matters as may be readily learnt from text-books like Boutell's smaller work on "English Heraldry."

The subject of the artistic treatment of heraldry is not one that can be dealt with satisfactorily in a short paper, even with the aid of illustrations. It is rather one to be studied from good examples of the many applications of it in which our forefathers took such delight, as in tombs and in painted glass, or in conjunction with architecture or coloured decoration generally. The best examples of all are to be found on seals, but these, unfortunately, are not so available for study as the more easily accessible authorities I have just named.

Heraldry, as we know it, was first reduced to a science in this country about the beginning of the thirteenth century, and we fortunately possess a long and splendid series of examples of its use, even from the first, from which much valuable instruction may be derived.

The question has perhaps often suggested itself to some of you, why do the ancient applications of heraldry always look well, while the modern attempts to use it are invariably dull, lifeless and uninteresting? The answer is much the same as the explanation of the difference in appearance between the old west front of the cathedral church of Peterborough and the new north front of Westminster Abbey. The one was the handiwork of masons who were themselves artists, while the other is the mechanical interpretation of an architect's drawings by mere human machines who work by rule. Ancient heraldic art was the product of men who thoroughly understood it and revelled in it. Modern heraldry is a lifeless thing, dependent on needless rules and restrictions, and derived from a succession of text-books and manuals that might profitably be collected and burnt in one huge bonfire.

I propose on the present occasion to deal with English heraldry only. Not that no other is worthy of consideration, but because there is not time except for the one, and that so fully illustrates the general principles of artistic heraldry followed in other countries that it is unnecessary to go further afield.

We will begin with a consideration of shields, and their treatment. The shape of a shield is in itself entirely arbitrary and devoid of meaning, and varied from time to time simply from change of fashion, like the form of an arch or the design of a window. These changes must not, however, be overlooked, for the shape of a shield varies according to its date, and it would be absurd to use one of the ornate forms of the fifteenth or sixteenth century on which to paint, say, a thirteenth type, or to fill an early form of shield with charges that tell of a much later date. There will, however, be found from the thirteenth century downwards one simple form of shield—that known as the heater shape, from its likeness to the base of a flat-iron, which, on account of its capability of displaying any one of the countless possible combinations of heraldic charges, has continued always in use. This may safely be adopted in general practice, and the elastic way in which its curves may be slightly altered when required specially commends it.

From the form of the shield we may pass to the consideration of its surface or field, and the way in which this should be treated.

In the simpler shapes the field when painted is invariably shown flat, but if carved a slight convexity, or even concavity, is often met with, the artistic advantages of which I need not dwell upon. Some of the ornate late forms, such as shields with incurved or engrailed edges, are often worked when carved into a series of ridges and furrows, and occasionally with good effect, but there is a tendency to carry this to excess, and so to injure the appearance of the charges. If the shield is well covered by the bearings on it, it is better to use a simple form than one with a ridged surface.

A reference to a number of good ancient examples of heraldic shields will disclose the care that has been taken to cover or fill up the field, as far as possible, with whatever is placed upon it. A lion or an eagle, for instance, will have the limbs and extremities spread out so as to fill every available corner, and the same will be found in every group or combination containing objects capable of arrangement or extension. Even with most unpromising combinations, or a group of charges that cannot be extended or altered in any way, or with a single ordinary, like a bend, pale, or chevron, the Mediaeval artist was still equal to the occasion, and by judicious adjustment of proportions or some equally common-sense method, contrived to make his shield look well. Another important point will also be noticed in all ancient heraldry, that in shields containing a number of like objects, such as the three lions of the royal arms, no two are exactly alike, but each differs slightly from another in pose or in size according to its place in the shield. So, too, lines and curves are hardly ever quite true, but are drawn by hand and not with pen or compasses.

Herein lies one of the great differences between the ancient and the modern treatment of heraldry. The modern artist draws his lines and curves with mechanical precision, his charges are exact copies one of another; the fact that they do not fill up the field is quite unimportant, and the final result is in every way unsatisfactory and hopelessly bad. Until such first principles as those I have shown to be what the old men followed be adopted and practised, no good result can be looked for.

Another feature of the old heraldry which it is well to bear in mind is the sparing use of that method of combining the arms of two or more persons or families in the same shield, which is known as "quartering." One of the oldest examples of this occurs on the tomb of Queen Eleanor, the consort of Edward I., in Westminster Abbey, where her paternal arms of Castile and Leon are so arranged. So long as the shield

\* A paper read before the Applied Art Section, Society of Arts, by Mr. W. H. St. John Hope, M.A., on Tuesday, January 26, 1897.

contained four quarters only, of which the first and fourth and the second and third were respectively alike; the effect was often good, as in the case just noticed, and in the beautiful royal arms of Edward III. But where, as became common in the fifteenth century, these quarters were multiplied or subdivided, the artistic effect of the old simple shields was destroyed. As the principle was further abused, especially in the Elizabethan and Stuart periods, the whole became more and more confused in appearance, until the field rather resembled a piece of Turkey carpet than a combination of various arms, each more or less beautiful in itself.

Another cause of the bad effect of much modern heraldry is to be found in the rules laid down in some of the text-books and manuals as to the relative widths of the ordinaries and sub-ordinaries. The old heralds certainly did not fetter themselves with such restrictions. A bend, or a chevron or a cross, whether alone or charged, was drawn of the best proportion to look well. If placed between other charges it was drawn narrower, if itself uncharged, and thus took its proper relative position with respect to the size and arrangement of the charges. So, too, with a bordure; if uncharged, or merely compons, it was drawn very narrow; and, even if charged, it was not allowed a much greater width. It thus never unduly intruded itself upon the other charges of the shield, and yet continued an artistic addition in itself.

In many ancient heraldic shields, especially in painted glass and to a lesser extent in carved work, the uncharged surfaces of the field or ordinary are sometimes relieved by covering them with the purely ornamental decoration known as "diapering." This beautiful treatment has happily been largely revived of late years by the glass-painters, who use it very successfully, probably from the ease with which in their case it can be applied. Carvers, like their Mediæval predecessors, use it very sparingly; this is perhaps as it should be. Diapering requires to be done with great skill in sculpture to look well, and a careful study of old examples is advisable, in order to thoroughly understand the principles of its application. Some of the finest diapered shields we have occur on the splendid monument of Lady Eleanor Perry in Beverley Minster. A few good instances are also to be met with on seals. It is, of course, to be borne in mind that diapering is merely a relieving of the surface, and it must not be emphasised by a difference of colour, or treated with such prominence as to render it liable to be mistaken for a charge or charges.

On the question of what tint or colours ought to be preferred in heraldic decoration I do not think I need take up your time, as some excellent suggestions will be found in Mr. Boutell's manual before referred to.

I should, however, before passing on to other matters, like to enter an earnest protest against what I may call the "dot-and-dash" system of expressing gold and the several colours. This disfiguring method of showing the tinctures was not invented until the end of the sixteenth century, and it is absolutely destructive of the artistic effect of any shield. Yet carvers and sculptors delight in its use, and examples abound in our streets and on our public buildings. If these good craftsmen would satisfy their craving for relieving plain surfaces by filling up the shield as far as possible with its charges, or by the skilful and judicious use of diaper-work, the poor shields would look better and the artist's capabilities be enlarged. Finally, before leaving the shield, let me say a word as to the treatment of the label. This, as some of you may know, is a narrow band, with three or five long pendent strips or "points" placed upon and across the upper part of a shield. It is now used to distinguish the arms of an eldest son from those of his father. Anciently the label was very narrow, sometimes even a mere line or cord, and the pendent points were narrow strips of the same, or nearly the same, width throughout, even when charged, as they occasionally were. In modern heraldry the label is often drawn unduly wide, and the points have become short and ugly wedge-shaped pieces hanging from it. The result is that, instead of being an unobtrusive addition to the shield, the label, which is usually white, becomes the most conspicuous part of it, and destructive of all artistic effect.

I must now say a few words concerning crests, the meaning and use of which seem to have been almost entirely forgotten. A crest was originally, as its name reminds us, a tuft or plume on the head of a bird. Such a tuft or plume in very early times was fixed as an ornament in the top of a helmet, of which it thus formed the crest. Other devices, such as could be conveniently so worn, were soon used for the same purpose, and by a perfectly natural process became associated with particular individuals. In later days, when the helmet enveloped the whole head, the crest played a useful part in revealing the wearer's identity, though his face was hidden. As the crest was thus so closely associated with the helm it was never by the individual heraldic artist represented separated from it except perhaps in some late examples of standards. So, too, the crest was always something that could be actually worn, objects that were naturally too large or heavy being represented by models made in boiled leather (*cuir-bouilli*), wood or

other light material. Such impossible crests as the pictorial scenes and other absurdities granted by the heralds in this and the last century, and even back into Elizabethan times, would not even have been thought of at an earlier period while heraldry was a living art.

The helm, of which the crest formed part, was, it is hardly necessary to say, such an one as was included in the war harness of the time. In heraldry it was almost invariably shown in profile, the present custom of different types facing different ways to denote various grades of rank being a comparatively recent one. In actual use the helm was often covered behind by a scarf of some kind to temper the heat of the sun, like a modern puggaree. Heraldically this is represented by what is called the mantling. At first this was a simple affair, disposed puggaree fashion, as on the tomb of Edward, Prince of Wales, at Canterbury, but it was by degrees enlarged until it extended on either side beyond the helm, and was disposed in graceful twists and folds with dagged edges which are supposed to represent the cuts it was liable to receive in war. The usual colour for the mantling was red, and it was lined with ermine fur, but there is ample precedent for a difference of treatment, as may be seen in that wonderful storehouse of ancient heraldry, the stall-plates of the Knights of the Garter in St. George's Chapel, Windsor, where mantlings of various colours and powdered with badges or formed of feathers occur. Of wreaths, coronets and the caps of maintenance usually associated with helms and crests, I need not say much. The history of their origin and use really belongs to the grammar of heraldry. Good examples, as models, should however be looked for, and of these there is, fortunately, no lack, as, for instance, the stall-plates at Windsor, or the beautiful plates of monumental effigies published by Stothard and the Brothers Hollis.

From what I have said as to the invariable ancient close association of helm and crest, it follows that the modern fashion of representing the crest by itself, without the helm, is entirely wrong. It at once renders the crest meaningless; in appearance it forthwith becomes insignificant, and any attempt to treat it artistically is usually a failure. Let crests be shown as crests, with practicable helms beneath them, and with the mantling treated with all the freedom that it is capable of.

Crests, unfortunately, do not stand alone as regards their misuse, for modern artists are equally at sea as to the proper treatment of supporters. These charming adjuncts to heraldic compositions no doubt originated in the animals or monsters often introduced on early circular seals to fill up the space between the shield and the surrounding margin.

A very slight exercise of the engraver's inventive powers represented these beasts as holding the shield itself, and thus they became the supporters of it. Once invented, they were very popular, and many grand examples occur on seals and monuments. In those Mediæval instances where the shield is surmounted by, and more or less subordinate to the helm, crest and mantling, the supporters invariably uphold the helm as being the heavier and uppermost object, the shield being assumed to depend from it. But whatever the thing supported, whether a shield alone or the helm and crest and shield combined, it ought not to be forgotten that the duty of supporters is to uphold and support. Nowadays, however, especially in representations of the royal arms, the so-called "supporters" often do not support anything, but are degraded into a pair of cowering beasts at the base of the shield, like the lion and unicorn over the door of the new National Portrait Gallery. The depth of heraldic degradation could hardly be illustrated better than by this very recent representation of royal arms. In marked contrast to them are the boldly sculptured arms of George I. (1726) over the portico of St. Martin's Church hard by.

During the fifteenth and sixteenth centuries a pretty fashion prevailed of utilising heraldic creatures generally as supporters or bearers of banners, which were often charged with arms or devices. Some of you may be familiar with the grand examples at the corners of the tomb in Westminster Abbey of Lewis Robsart, Lord Bourchier, who died in 1431. In this case large quartered banners of arms, the poles of which are ingeniously worked into the buttresses, are held by lions and falcons alternately. Some beautiful examples also occur on seals. In architecture these banner-bearing creatures were often used with happy effect as terminals to buttresses or pinnacles and in other suitable places. The buttresses of St. George's Chapel, Windsor, for instance, were once surmounted by stone figures of the "King's feasts," as they were called, holding long rods with gilt vanes, the effect of which as they turned with the wind in the sun must have been very pretty. Similar figures also formerly stood on stone bases at the angles of the trim little walks in the privy garden at Hampton Court.

The use of banners for the display of armorial bearings might with advantage be more widely adopted. Everyone is familiar with the banner of the royal arms, which is so wrongly called the royal standard, and with our splendid national naval banner, better known as the Union Jack. Many of you, too,

may have noticed the banner with the arms of the City of London, which floats above the Mansion House when the Lord Mayor is in residence. Let a banner once be regarded in the light of a rectangular shield, and its fitness for armorial bearings directly becomes apparent. Mediæval banners of arms were usually placed upright, that is, with the long side next the staff, and in this form they have an excellent decorative effect. At a later date they became square, and then longer than they were high, so reversing the old state of things. In practice it will be found that though this latest form is convenient when the banner is used as a flag, so it is not always easy to arrange the arms on it that they will look well. In the royal banner, for example, although the lions of England may be sufficiently elongated and attenuated to fill up the quarters allotted to them, it is very difficult to properly display the lion rampant of Scotland in a space which is more suitable for a lion passant. Had the banner been of the old form, or even square, no difficulties whatever would have arisen. Whatever be their shape, banners, like shields, ought as a rule to be completely covered with the heraldry, like the banners of the Knights of the Garter of Windsor. Examples, however, are not wanting even in the fifteenth century of banners charged with regular heraldic achievements, sometimes on striped or parti-coloured fields. Banners were generally bordered with a narrow fringe, either of gold or of the principal colour and metal of the arms displayed upon it.

Of the curious long and tapering banners called "standards," which were so popular in the fifteenth and sixteenth centuries, and of the badges for the display of which they were chiefly used, a very interesting chapter might be written. The whole history of badges is of itself one of great interest, and the facility with which badges lend themselves to artistic heraldic decoration renders them of peculiar value. A badge is, properly speaking, any figure or device that is assumed as the distinctive mark or cognisance of an individual or family; and it should be borne alone, without any shield, torse, or other accessory. A badge, however, may be, and often was, accompanied by a motto. The wearing of a man's badge by his dependents still survives in the "crest" on the buttons of liveried servants, and were the torse or wreath on which it is placed omitted, the "crest" would at once become a badge. Seeing that a crest was pre-eminently the personal device of its wearer, it needs but little consideration to show that what was once an ensign of honour ought not to be degraded to a mark of servitude.

Badges were anciently used as ornaments, or ornamental devices, in every conceivable way and on almost every conceivable object, and now that crests are no longer actually worn, the revival and use of badges is a subject worthy of consideration.

A point that is often overlooked in modern heraldry is the proper way of drawing the various creatures that are used in arms, crests, badges and supporters. Since heraldry is but a survival of what was once a living thing, it is clear that, if our work is to look well, we ought to draw our animals in a more or less conventional manner. Some creatures, such as dogs, elephants, falcons, &c., may be drawn almost directly from nature; but others, especially lions, if so represented, would be manifestly unfit to consort with the dragons, the gryphons, the double-headed eagles and other queer creations of the early heralds. The conventional treatment should not, however, be carried to excess, nor should natural forms be too closely copied. Here, as in other matters connected with heraldry, a comparative study of good ancient examples will soon show what are the best types to follow.

The treatment of mottoes may not, at first sight, seem to have much connection with my subject, but actually it is one of some importance. There is a good deal to be said for the theory that mottoes are derived from war-cries of early times, and hence their frequent association with the crest worn on a man's headpiece. In such a connection the motto should pictorially be represented on a scroll disposed about the crest, as may be seen on divers seals and other authorities. The association of a motto with a shield was not common anciently, and when it is so found it is generally placed on a scroll, like the well-known examples on the Black Prince's tomb at Canterbury. In later times, when shields began to be encircled by the Garter of the famous Order, mottoes were often arranged round the shield in a similar way.

There was, however, always this very important and noteworthy distinction, that the buckled band now so universally adopted was anciently never used for any other than the motto of the Order of the Garter. Other mottoes were written on a band which was fastened in a different way, or merely disposed, Garter-fashion, round the shield. Two examples in illustration of this practice readily suggest themselves, one is on the west porch of the cathedral church of Norwich, where the royal arms of Henry VI. are encircled by the Garter, while the motto of the builder, Bishop William Alnwick (1426-36), is placed on a scroll surrounding his shield of arms; the other case, which is exactly parallel, occurs in the well-known brass of Robert Hallam,

Bishop of Salisbury, who died and was buried at Constance, where his brass is, in 1416. The distinction was carefully borne in mind when the insignia of our Orders of Knighthood, other than that of the Garter, were designed, and in every case their mottoes are shown on plain and not buckled bands. In the Albert medal the encircling motto has been most improperly placed on a buckled band like the Garter.

The lettering of a motto must of course depend upon the circumstances of its use. Nothing looks so well as the so-called "Old English," or small black letter, especially if the height of the words is as nearly as possible that of the width of the band or scroll and the capitals are kept down to about the size of the other letters. The form known as Lombardic is often preferable for capitals to those of the black-letter alphabet. When capitals alone are used fanciful types should be avoided, a good Roman form, such as is found in Tudor inscriptions, being far better. If the motto is a short one it can be conveniently extended if necessary by a judicious use of ornamental stops, such as roses or other flowers. The ends of scrolls with mottoes have a more satisfactory appearance when represented curled up and partly pulled out spirally, than if forked and waved, as may be so often seen nowadays. The scrolls themselves also look better if they are not bordered or edged in any way, but if this is necessary, as sometimes in the case of enamelled work, the border should be of the smallest possible width.

I have so far only referred to the ordinary applications of heraldry, and to the way in which, in my humble opinion, a more artistic treatment might be adopted with advantage. I have also spoken of the difficulty of dealing with the subject satisfactorily within the compass of a brief paper, and to the necessity of studying good examples of heraldic art.

Before showing you a number of such examples on the screen, I would like to call your attention to one of the many interesting facts that a comparative study of ancient heraldry will soon disclose, and that is the way in which our forefathers, as it were, played with heraldry. They were not content with confining it to its original use as an aid to recognition in the field or in the lists, but on their seals, their weapons, their garments and vestments, their jewels, their plate and furniture, their carpets, hangings and cushions, in the windows and on the walls of their houses, in their churches and on their tombs every kind of heraldic decoration was used with the utmost profusion. With many of these forms of application most of you are familiar from the examples we are still so fortunate to possess, but for some we must go further afield. Where, for instance, can we see the like of the great bed of black satin embroidered with gold roses and the white lions of the House of March, with escutcheons of Mortimer and Ulster, that was bequeathed by Edmund Mortimer, Earl of March, in 1380, or such jewellery as the brooch of Stafford Knots, left to his daughter in 1385, by Hugh, Earl of Stafford? Who could now, like Richard, Earl of Arundel, in 1392, bequeath such articles as a blue bed with the arms of himself and his late wife; the hangings of his hall, of blue tapestry with the arms of his three sons-in-law; and a pair of silver basons with his arms emblazoned at the bottom? We read, too, of such legacies as that of Eleanor de Bohun, the wife of Thomas of Woodstock, of a psalter with clasps of gold enamelled with white swans—the badge of her house—and with the arms of her lord and father, and ornamented with gold mullets, such as were borne in her paternal arms. Again, Edward the Black Prince—among other bequests to the cathedral church of Canterbury—left a chalice of gold with his arms on the foot, two basons with his arms, a great gilt and enamelled chalice with the arms of WARENNE, and his "hall-ing" of black tapestry powdered with his ostrich feather badge, with a red border with swans with ladies' heads. He also left, for the use of his chantry priests, a mass book and a porthos, which he had caused to be illuminated in divers places with his arms and "our badges of ostrich feathers."

These are but a few specimens taken quite at random, such as may be gleaned from any collection of wills or inventories; but they are enough to show, with the many examples of heraldic decoration in our churches, our museums and elsewhere, that our forefathers knew better than merely to paint their arms on the panels of their carriages, or engrave a helmetless crest on their spoons and forks, or emboss the same feeble device on the buttons of their men-servants. This bald and paltry treatment of a really beautiful art, which is generally all that it receives nowadays, ought surely to be amended.

That heraldry is becoming more and more popular daily there can be no doubt whatever, and with its increasing popularity there must come a greater appreciation of its many beautiful forms of application. If there should be concurrently with such a revival a corresponding improvement in the artistic treatment of heraldry, we may yet again see folk so alive to its merits as to wear heraldic ornaments and embroider their bed quilts with arms and mottoes, and have their badges woven into their carpets and hangings. People are proud of their

ancestral homes, their old furniture, their pictures and plate; why should they not show their pride in their armorial bearings by displaying them in every legitimate and artistic manner?

### GLASGOW INSTITUTE OF ARCHITECTS.

THE usual quarterly general meeting of this Institute was held in the rooms, 187 Pitt Street, on the 28th ult., Mr. John James Burnet, A.R.S.A., president, in the chair. It was reported that among other recent additions to the Institute library was the fine work by Taylor and Cresy on the "Antiquities of Ancient Rome," presented by Mr. David Thomson, for which a vote of thanks was accorded him. The President referred to the fact that two of the members, Messrs. Honeyman and Leiper, formerly associates of the Royal Scottish Academy, had now been elevated to full membership, and it was unanimously agreed that the hearty congratulations of the Institute should be sent to them. The secretary reported that the prize drawings of the Royal Institute of British Architects would be on exhibition in the rooms of this Institute during the two weeks commencing April 12 next. It was agreed to hold an informal dinner in the rooms on March 3.

### GLASGOW ARCHITECTURAL ASSOCIATION.

AT the meeting held on the 25th ult., under the chairmanship of the president, Mr. William Tait Conner, A.R.I.B.A., Professor Mills, D.Sc., F.R.S., delivered a lecture on "The Application of Photography to Architectural Measurement." The lecturer proceeded to show that by means of photography correct architectural measurements could be obtained, heights could be accurately ascertained, and by simple methods the plan of a building, or part of a building, could be laid down from a photograph. The lecturer explained in detail as to the various apparatus required to produce these results. A number of photographs taken by the lecturer were then thrown on to the screen. On these the professor showed that, given one or two measurements, any particular size could easily be ascertained by scale. At the conclusion a hearty vote of thanks was accorded to the lecturer.

### ST. PAUL'S ECCLESIOLOGICAL SOCIETY.

THIS Society, of which Dean Gregory is president, held its eighteenth annual meeting on Saturday in the Chapter-house of the Cathedral. The Society is the outcome of a suggestion, made in 1878, that many City men would be glad of opportunities of visiting buildings of architectural and antiquarian interest, under the guidance of experts. Canon Lewis Gilbertson, who presided at the meeting, said their transactions took a very high place among the learned societies up and down the country, and he hoped the members would do all in their power to extend the usefulness of the St. Paul's Society.

### THE NEW YORK ARCHITECTURAL LEAGUE.

THE twelfth annual exhibition of the Architectural League of New York will be held in the building of the American Fine Arts Society, 215 West Fifty-seventh Street, next month. Exhibits will be received, closing Wednesday, February 10, at 6 P.M.; the press view will be on Thursday, February 18, from 10 A.M. to 4 P.M.; the annual dinner the same evening, the League reception Friday evening, February 19, and the public exhibition from Saturday, February 20, to Saturday, March 13, inclusive. Hours, 10 A.M. to 6 P.M., 8 P.M. to 10 P.M. Sundays, 1 P.M. to 6 P.M. and 8 P.M. to 10 P.M. There will be public lectures on Wednesdays, February 24, March 3 and 10; members and guests' smokers on Saturdays, February 27, March 6 and 13. The pay days are all Tuesdays and Thursdays, when the admission is 50 cents. All other days free. The exhibition will consist of architectural drawings in plan, elevation, section, perspective and detail; drawings of decorative works; cartoons for stained-glass; models of executed or proposed work; completed work, such as carvings in stone, wood, bronze, wrought-iron, mosaic, glass, textile fabrics and furniture; sketches and paintings of architectural or decorative subjects. Photographs will be admitted only when they serve to elucidate an accepted exhibit.

The subject of the tenth annual competition for the gold and silver medals of the Architectural League will be a court enclosure and entrance. This structure is designed to furnish a covered passage, 10 to 15 feet wide, connecting the projecting wings of a public building constructed around three sides of a court open to the street, and to form at the same time a screen or enclosure between court and street, with an imposing

central entrance. The distance between the wings is 83 feet and the height of the ground storey 18 feet. Each sheet must be distinguished by a motto or cypher. A sealed envelope bearing the same motto or cypher must contain the name, full address, place and date of birth of the author, and must be mailed to the committee on competitions and awards, Messrs. Bruce Price, chairman, W. T. Owen and A. D. F. Hamlin.

### TESSERÆ.

#### Rome under Goths and Vandals.

THE same causes which diminished the population of Rome did not necessarily affect the public monuments. It is generally acknowledged that the Gothic and Vandalic conquerors, with the exception of Totila, "affected to spare" them; or, what is more likely, found no use for the materials of stone and marble. Belisarius, in his letter to Totila, could still call Rome the greatest and most splendid city in the universe, observing that it had not arrived at such a pitch of grandeur and beauty by the power of any one man; but a succession of kings, a long series of generations, a crowd of enterprising men and an abundance of wealth and resources from every part of the world, had alone raised it to the splendour in which it then was. In another place Procopius remarks upon the zeal which the Romans had ever shown about the ornaments of their city, "and although," says he, "it has now been a long time ruled by barbarians, the edifices are still preserved, and, as far as could be expected, very many of the architectural ornaments also." After the vengeance of Totila was gratified this was no longer true; for there can be no doubt he destroyed many of the temples and other edifices; and although he afterwards showed some anxiety about repairing the mischief he had done, still his age may be considered as the first great epoch of the city's ruin: for the rest being but the work of time, it was sufficient to bring the stately buildings down to the ground. Nearly half a century after the dominion of the Goths ceased, St. Gregory thus writes:—"We behold in what condition Rome hath survived: oppressed in various ways by the greatest calamities; by the loss of her citizens, the ravages of her enemies, the constant falling of her ruins." And again:—"But why do we say these things of men when we see the very buildings falling asunder by increasing decay?" Such, then, is the picture of the "eternal city" at the end of the sixth century, in which we see the edifices neglected and gradually falling into ruins, but not wantonly destroyed; and it is evident that Rome in her public monuments, except the plunder of the precious metals, escaped out of the hands of Goths and Vandals with all the features of her pristine glory, which were reserved only for time to tarnish, until a new period of wanton destruction arrived.

#### Expressiveness of Gothic.

It is a mistake to lay too much stress upon the forms of Gothic architecture, as though it was from them and not from the man who uses them that their expression comes. Hence the dissatisfaction with so much of modern Gothic work. The forms are correct enough, but you want the old master's soul behind them. The fact is that Mediæval art gets its romantic charm from the spirit that animated its designers. So far as mere variety of form and play of fancy are concerned, Wren's spire at St. Mary-le-Bow far transcends Salisbury's spire; but the conscious art of the former, studied harmony of its proportions, the subtleties of its fancy, are not favourable to romantic effects. It lacks the simple aspiration and naïve utterance of the other. The expressiveness of Gothic art is usually ascribed to the variety and contrast of its effects, and to the intricate harmony of its constructive lines, such as is to be found at Abbeville, Rouen, York, or Gloucester. But to stop here were to leave the tale untold. There is a noble severity about the early phase of English Gothic, both in regard to proportion and scale, that is highly stimulating to the imagination. Think of the interiors of Durham and Peterborough, with the strange colossal scale of their features and ornamentation, that hint of the sense of physical power and indomitable will of their builders. The majesty of their pregnant lines carries us back to the grand buildings of old Rome that are like vast mountains haunted with mighty shadows. That there is more picturesqueness of plan and construction in the later work like York or Gloucester, more harmony of related parts, more play of sequent motive than in the tentative earlier phases was to be expected, for art "widens with the process of the suns," and just before the Gothic forms were forsaken the art comes to a head in that "glorious work of fine intelligence" at King's College, Cambridge, so eloquently described by Wordsworth, with its lofty pillars, its "branching roof self-poised and scooped into ten thousand cells, where light and shade repose, where music dwells lingering, and wandering on as loath to die." Yes, Wordsworth finds architecture to be something more than bird-and-beaver craftsmanship, and his spirit is

stirred by its magic, though of figure sculpture it has none. What affects him is its piquant variety of light and shade, and colour and play of motive, and borrowed charm of personality that makes the logic of passion and imagination in a fine building, and speaks of divinely inspired cunning. What is more, he realises that not sculpture but organ music will interpret the meaning, fill with expression and make to vibrate every nook and corner of the amplest and loftiest edifices. Milton found it out before him.

### Heraldry of Oxford Colleges.

Magdalen bears the arms of William of Waynflete—one of the great prelates of the Middle Ages, the patrons of learning, the promoters of all reforms and the civilisers of England—who alternately presided over Eton and Winchester Schools, and afterwards, becoming Bishop of Winchester and Lord Chancellor of England, founded Magdalen College in Henry VI.'s troubled reign. His paternal coat was lozenges, sable and ermine, and three lilies proper on a chief sable, the lilies being the noble Lincolnshire gentleman's remembrance of Eton School, which bore the same distinction. Very priestly and solemn is their prelate's shield, with its sable field and silver lozenges, and silver lilies tipped and stalked *or*. No blood ever defiled it, and very precious ink dyed it of that sober colour. Merton's shield is three chevrons—gules and azure on a field *or*—and was the arms of Walter de Merton's patron, Gilbert de Clare, Earl of Gloucester, with a difference of blazon; for in those days, when men so often put out strong helping hands to each other, it was not unusual to borrow arms. Walter de Merton was another of the broad brows—priest and statesman, architect and scholar—who buttressed up the troublous ages. Walter was Bishop of Rochester and Lord High Chancellor of England under Henry III. and Edward I. He founded Merton as a refuge for the secular clergy, and to protect them against the puffed-up regulars. His shield must have been the very pole-star of a tournament, with its glittering gold field and its bars of ultramarine and vermilion. Oriol College is said to have been erected in pursuance of a promise made by Edward II. to the Blessed Virgin, when flying hot and scared from the red sodden field of Bannockburn. The college bears still the arms which he bore on his cloven shield—gules, three tabards passant, *or*; the difference being a bordure engrailed argent. The crimson shield, with its silver border and elongated golden leopards, is the shield Bruce must have frowned on when he broke his good mace on De Bohun's worthless head.

### Cathedral Illustrations.

DEAR SIR,—It would be nothing short of ingratitude on my part (as a groveller amongst our grand cathedrals and a collector of all sorts of pictures of them for many years) not to thank you for the magnificent photogravures you are now publishing. I and some others are perfectly delighted with them. I had started remounting my collection, but you have stopped me short; it will be incomplete without your set, although I have Mr. Herbert Railton's opinion that "it is the finest he ever saw." Would it be too much to ask you in what order the remainder of them will be published?

But I must add a serious protest. Do, for mercy sake, print all of them on the thick paper, and not back to back; and if possible keep the most interesting letterpress in one or two pages, so that it can be preserved as well, as I am of opinion that it will be still more interesting. I hope you will not be offended with me for these few remarks. With best wishes for the greater success of *The Architect*, to which I have been greatly indebted for many years—in fact, for its commencement.—Yours truly,

HENRY EWD. JOHNSON.

34 Fairfield South, Kingston-on-Thames:

February 3.

[We are much obliged to Mr. Johnson for his good opinion, but if he will purchase a second copy weekly he will find he can mount all the views and their ample descriptions, while the expense will be less than is generally paid for a small photograph.]

### GENERAL.

**Bow Church** in Bow Road is not to be removed by the London County Council, as the scheme for the widening of the road has been abandoned.

**The Secretary of the Treasury** announced on Monday that it is not the intention of the Government to ask Parliament

to provide funds for completing the frontage of the South Kensington Museum.

**The Zochille Collection of Armour**, which was sold by Messrs. Christie, Manson & Woods, realised 11,257*l.* for the 862 lots.

**A Meeting** of subscribers to the purchase of the Churchyard Bottom Wood, convened by Mr. C. F. Cory Wright, the chairman of the Hornsey Urban District Council, was held at the District Council offices, Highgate, last week, when local subscriptions to the amount of 2,051*l.* were announced. A general committee and also an executive committee were formed. The price to be paid for the wood, which comprises about 50 acres, is 25,000*l.*, and of this sum the Hornsey Council have undertaken to provide 10,000*l.*

**The Wesleyan Chapel Committee**, in their annual report, state that they have sanctioned during the year 393 cases in all—new chapels, ministers' houses, schoolrooms, alterations, enlargements and improvements—at an estimated outlay of 262,208*l.* The entire debt remaining is 70,852*l.* The net amount actually contributed in Great Britain as reported this year is 230,928*l.* The total of ascertained outlay and expenditure on new erections and in reduction of debt is 310,461*l.*

**The Lords of the Admiralty** have charge of the following historic buildings:—Greenwich Hospital, Greenwich Hospital School, Royal Observatory, Greenwich, and Upnor Castle.

**The Executive Committee** of the Archbishop Benson Memorial have decided to recommend to the general committee, at a meeting to be held shortly, that a sum not exceeding 2,500*l.* be set apart for the Canterbury monument, and that the balance of the fund should be devoted to some definite portion of Truro Cathedral.

**The Next Ordinary General Meeting** of the Surveyors' Institution will be held on Monday, February 8, 1897, when a paper will be read by Mr. J. W. Willis Bund (Associate) entitled "Allotments and Small Holdings." The chair will be taken at eight o'clock.

**A Sessional Meeting** of the Sanitary Institute will be held at the Parkes Museum, on Wednesday, February 10, when a discussion will be opened by Mr. F. J. Waldo, M.A., M.D., D.P.H., barrister-at-law, medical officer of health, St. George the Martyr, Southwark, and Inner and Middle Temple, on "Sanitary Supervision of Shelters for the Homeless." The chair will be taken at 8 P.M. by Mr. Robert Farquharson, M.D., F.R.C.P., LL.D., M.P.

**The Society of Architects** will have their annual dinner at the Hôtel Cecil on the 23rd inst.

**The Annual Exhibition of Paintings** in Antwerp will be opened this year on March 12.

**Jules Simon's Monument** is to be designed by M. Scellier de Gisors, the architect having charge of the Luxembourg. The sculpture will be M. Fremiet's work.

**M. Auguste Riden**, the French sculptor, has presented to the Musée of Geneva his *Podte* and *Femme accroupie*.

**M. Frantz Jourdain**, architect, has arranged to deliver a course of lectures on the history of architecture for ladies at a school in Paris.

**M. Paul Sédille** has published a small volume of his poems, which is dedicated to his friend, M. Sully Prudhomme, the Academician. The title is "Rayons d'Automne."

**The Site** of the Hanover Chapel, Regent Street, was let on a building lease of eighty years on Tuesday, at a yearly rent of 2,120*l.* As the frontage is 75 feet and the area 6,666 square feet, the rental value is 6*s.* 4*d.* per square foot, and this ground-rent, capitalised at thirty years' purchase, comes out at 415,000*l.*, or approximating to half a million per acre.

**Mr. George McCulloch** will on Tuesday next read a paper before the Applied Art Section of the Society of Arts on "Lithography as a Mode of Artistic Expression."

**The Next Ordinary Meeting** of the Institution of Civil Engineers will take place on Tuesday, February 9, at 8 P.M., when a paper will be read, with a view to discussion, on "Cold Storage at the London and India Docks," by Mr. H. F. Donaldson, M.Inst.C.E.

**Sir Henry Doulton**, on his re-election as president of the Pottery and Glass Trades Benevolent Institution, has given a donation of fifty guineas for the initiation of a special fund in commemoration of "the Diamond Jubilee."

**Two Lectures** on "Why Buildings are Interesting" will be delivered by Mr. F. Herbert Mansford to the South Place Ethical Society on Mondays, 8th and 15th prox. The chair will be occupied by Mr. Alfred Preston, past master of the Carpenters' Company.

**The Foundation-stones** of a new Salvation Army barracks were laid last week at Harrogate on a site at the corner of Chapel Street and Beulah Street. The estimated cost of the building is 7,150*l.*

# The Architect.

## THE WEEK.

MR. WHISTLER should be grateful when he learns that the purchase of his portrait of THOMAS CARLYLE for the Glasgow Corporation gallery is considered by ex-Deacon Convener TULLIS to be "the most creditable purchase that was ever made for any public gallery." Perhaps Mr. WHISTLER will now consider he ought to have received a higher price for the work, but to be placed above RAPHAEL, MURILLO, TITIAN, VELASQUEZ and other painters of costly works is surely equal to the receipt of a large sum of money. On the occasion when the opinion was pronounced—that is, the banquet of the Royal Glasgow Institute of Fine Arts—Mr. McWHIRTER, R.A., was the chief orator. In referring to the changes in the Royal Academy, he said that "if the old institution should go a little slow at times, a sure remedy was to look out for another Scotchman; it had been tried before with success." What does Mr. McWHIRTER mean? Scotsmen have power in the Academy, but only one of their countrymen has reached the President's chair. REYNOLDS, WYATT, LAWRENCE, EASTLAKE, LEIGHTON and MILLAIS were English; WEST was an American, SHEE was an Irishman. The Scottish representative was Sir FRANCIS GRANT, and it could not be said of him that he was a go-ahead president, or introduced more expedition into the proceedings.

It would appear as if MEISSONIER was likely to be the favourite of the auction-rooms in Paris for some time to come. At a sale a few days ago one of his small works was sold for 94,100 francs, and another for 72,000 francs. But the Barbizon school still has admirers who can pay good prices. A picture by DAUBIGNY brought 78,000 francs, one by ROUSSEAU 77,500 francs, and five by COROT found purchasers at 26,800, 17,800, 30,000, 32,000 and 35,000 francs respectively. Three drawings by J. F. MILLET were sold for 16,200, 20,200 and 27,000 francs. One of DAUMIER'S pictures realised only 1,850 francs and another 5,200 francs, but the artist was never sufficiently appreciated. The prices may appear low if compared with those which are given in the King Street rooms, but they are much more generous than was anticipated.

OWNERS of gardens which are surrounded by old brick walls would do well to take warning from a fatal accident which occurred a few days ago in Birmingham. A watchmaker was passing along Varna Road when a wall suddenly collapsed and fell on him. He died immediately afterwards. The owner of the house said it was in his possession for a year. The premises were examined by a builder, who said the wall was sound and plumb. Mr. PEMBERTON, the building surveyor of the Corporation, said the wall was 9 inches thick, 8 feet high and 42 yards in length. Twenty-four yards of the wall had fallen. He thought a wall of that length should have had buttresses every 8 feet apart. He did not think the wall was properly "bonded," and the bricks were not properly backed with mortar. He was told the property was built in 1851. There would be nothing to show that the wall was unsafe. The foundations were most satisfactory. The jury returned a verdict of "Accidental death," but suggested that the rest of the wall should be examined, and buttresses added if necessary. It is remarkable that a larger number of fatal accidents do not occur from defective boundary walls. Too often they are not strengthened throughout a long length by any addition to the thickness, and as foundations are shallow and liable to settlements, walls are often rent in more than one place. All that is done to remedy the defects is to introduce a little mortar or cement, and sometimes the remedy leaves the wall in a worse condition.

ALTHOUGH large sums have been expended in remedying defects in the early Board schools of London, it must not be supposed that there will be no further outlay on the buildings. A case has occurred in Battersea which is ominous. The local managers of the Tennyson Street

school (which was erected in 1876) have found that the corridor is of inadequate width—being only 3 feet—and may become a source of danger if great care is not exercised in dismissing the children. The staircases would also be destructive in case of fire. The works committee, who have investigated the subject, agree with the managers. The improvements do not appear to be extraordinary, but to carry them out will cost not less than 7,000*l*. The school had to be enlarged three years after it was opened, but as no additional provision was made for staircases or corridors the danger arising out of the original plan was increased.

THERE is an old institution in Dublin known as MARSH'S Library, which adjoins one of the cathedrals. It belonged to an Irish archbishop, and contains the greater part of Bishop STILLINGFLEET'S library. Altogether there are between 30,000 and 40,000 books. The Rev. G. T. STOKES, D.D., has been examining the books, and he has discovered an indulgence granted by Cardinal WOLSEY and Cardinal CAMPIEGGIA to all who would contribute alms towards the completion of Hereford Cathedral. It was found pasted in between the binding of one of the books. It was similar to the indulgence granted in connection with the rebuilding of St. Peter's, Rome, and which caused LUTHER'S protest against Papal authority. The Hereford document was issued at least fifteen years before there was the slightest rumour of religious differences in England, and, as such, is a curious and unique possession. There are missals, breviaries, prayer-books, of which copies are not to be found in the British Museum. Although the contents mainly relate to historical subjects, the library is rich in historical works. It is well known that THOMAS MOORE the poet spent a long time in MARSH'S library when he was gathering materials for his "History of Ireland." The library is, however, at present a comfortable retreat for the officers. During the past year only two visitors dared to enter it. When it was less deserted thefts of rare books were so common that an order was made that every reader on leaving was to be searched. The order is still in force and is still exhibited on the walls with the date 1779 attached.

WE cannot say we approve of the verdict of the coroner's jury, which was that the foreman and ganger feloniously caused the death of the twelve labourers who fell from the Coldrenick viaduct, on the Cornwall Railway, owing to the breaking of the platform on which they were employed. The viaduct is of great height, but rather primitive in form, and it was found necessary to increase its strength. The bays were alike in character, and the directions were to complete the transformation of one at a time. The rail-bearers were to be supported during the operations of introducing new steel beams by means of a chain, which had to be tightened by wedges. The chain was supposed to be capable to sustain a weight of three tons. Now every one who has had much experience with chains is aware that one weak link makes them useless, and however sailors may value them, a landsman who is not connected with machine work always has misgivings about the strength of a chain. Unless it was distinctly stated to a foreman or ganger that his life and the lives of the men working with him depended on the tenacity of a chain, we doubt if any ordinary ganger or foreman would be competent to realise the fact. It is a novel means of security, and is always liable to be undervalued. That information was not given. The chain, it is said, was not used, and the accident followed. The ganger has said that "he never had definite orders concerning the use of chains; he used his discretion." The jury recommended that printed instructions should be issued as to the use of chains, but as there were no such instructions and no special discourse delivered, it is hard to cast the responsibility on men for not doing a work which seemed to them to be superfluous. The party of workmen were left to act as they thought best, for it is admitted that less personal attention of the engineers was given as the repairs to the viaduct advanced. The men acted ignorantly and twelve of them paid the penalty, but it is unjust to cast the responsibility for their deaths on the survivors.

## SCULPTORS AND ARCHITECTURE.

ARCHITECTURE has more affinity with sculpture than with any of the other arts which are subservient to it. Whether the building is of marble or of oak, it can be adorned by the sculptor's hand without the introduction of foreign materials. A wall need not be any weaker for containing figures in relief or formed of incised lines, and a column will sustain a weight, although the whole of the shaft appears surrounded with bands of amorini, or is encircled with garlands of flowers. Painting cannot be accomplished without the employment of something that is foreign, and can hardly be said to increase the strength of the material it covers. Fresco is allied to commonplace stucco, and resembles a covering to conceal defects. Paint can offer some little resistance to atmospheric influences, but, speaking generally, its purpose is ornamental.

When the relation between masonry and sculpture was perceived, it was natural that theorists should suppose that the origin of sculpture is not to be traced to idols or representative images of kings and queens, but to the early attempts by which stone walls were supposed to be improved by graving images on them. We may even assume that in a remote age there was no definite division between the stone-worker and the stone-decorator. But as division of labour seems to be a need among men whenever they attempt to co-operate, the carvers of stone would gradually become separated from the men who laid stones in courses, without much squaring. As construction advanced it would be found there was not much analogy between building and sculpture. A power which we now call scientific was required by whoever attempted to make a house that would withstand wind and weather, while it was not essential to the sculptor. Many of the great masterpieces of antiquity reveal a deficiency of that knowledge of gravity which would have enabled their creators to produce figures that resembled natural forms, in standing upright without extraneous support. When we see the trunk of a big tree upholding a horse or a centaur, or attached to the limbs of a god, we may overlook it in the same way as we do the modern devices to cure smoky chimneys in streets; but both are remedies to make up for a want of acquaintance with simple scientific principles. However primitive people might be, they were never likely, out of devotion to the sculptor's art, to allow any of those artists to meddle with the construction or arrangement of their buildings. Tombs in which they imitated buildings alone were tolerated. There is no legend to suggest the contrary, and to suppose that men at any period sacrificed their convenience to art would be like saying they were deprived of shrewdness and self-love.

When, therefore, it is declared that PHIDIAS was the architect of the Parthenon, a conclusion is drawn which is not warranted by anything known about the practice of the Greeks at an earlier time. They were a conservative people, but there was no ancient custom which would warrant a sculptor's assumption of a dual office. We should remember also that PERICLES was surrounded by enemies who were ready to twist all his efforts to adorn Athens into treason against the State. The Parthenon was a Hellenic rather than an Athenian memorial, and it was supposed the great works were intended to aggrandise PERICLES himself. The expenditure was scrutinised the more closely because no control was exercised over the funds by the citizens. To assign to PHIDIAS the least direction of the builder's work would be to give endless opportunities for charges of extravagance. Keen eyes were always jealously watching the operations. The works at the Parthenon were also a sort of battlefield between the representatives of two varieties of art, the ancient and the modern, and it may also have been between the representatives of Athenian and other schools. Incompetence of any kind in building operations would soon be discussed beyond the Acropolis, and news of it would be welcome to the opponents of PERICLES and PHIDIAS. Circumspection was needed by the two friends, and although they were guarded in their ways they were not victorious. The Parthenon was fatal to them. Then, again, those people cannot know much about architectural practice or how a Greek temple was constructed who suppose that PHIDIAS was able to direct the masons as well as the sculptors. Some years ago the late W. W. STORY, after

an investigation of the subject, was able to demonstrate that as PHIDIAS was not a BRIAREUS, he could with his two hands never have accomplished more than a small part of the sculpture. Was he likely to abandon his own art in order to meddle with architectural designing or superintendence?

The most that can be made of the connection of PHIDIAS with the Parthenon was embodied by M. BEULÉ, the French archæologist, in a couple of dramatic essays which, from their form, allowed of the exercise of imagination. He represents the artist as the inspiring spirit of the works, but one that depended on suggestions rather than on commands for his influence. In one scene PHIDIAS asks ICTINUS, who is described as "architecte du Parthenon," whether he is satisfied with the marble, and counsels him to be regardless of expense so long as blocks are obtained without flaw or stain. ICTINUS inquires whether they are to continue the forming of all the lines as curves, for although he was contemplating a treatise on the subject, yet like all who attempted a novelty in those days he feared to excite the criticism and it might be the raillery of the Athenians. The reply of PHIDIAS was that the lines would rather excite admiration, for they would exemplify a new species of beauty. Much as he admired the old architecture, PHIDIAS said it appeared to his eyes as dry and cold. In nature there were no straight lines; the trees that rose towards heaven had rounded surfaces and the mountains themselves were curved. The straight line was without reality; it was a fiction traced by geometricians and applied by architects in buildings. It was the task of an artist like ICTINUS to draw from nature the secret of her curves, and thus to produce exquisite beauties. But will the crowd comprehend these beauties? interposes ICTINUS. If they cannot comprehend them, answers PHIDIAS, they will at least feel them. And he goes on to say that the majority of spectators will be incapable to perceive the subtleties, because they will be too little emphasised, but they would feel the effect just as they did with a beautiful human body. The temple had its own constitution, laws and proportions; it was the duty of ICTINUS to impart the life. ICTINUS then exclaims that PHIDIAS strengthened his courage, and was like a fire which could not be approached without deriving new joy and force from it. In so popular a form did M. BEULÉ express his conclusions; but there could be no question of the scholarship which inspired what he wrote. It was open to him to make of PHIDIAS an universal genius, for by doing so more dramatic effect would be produced; but M. BEULÉ did not exceed the limits which long years of study had laid down. To him ICTINUS was the architect of the Parthenon, a man of genius who was subjected to the doubts and fears which accompany novel experiments, and who would have returned to the system which precedent had sanctioned if he had not the authority of PHIDIAS to support him. Any one who studies such records as time has spared, and who tests them by that probability which is the guide of life, can come to no other conclusion. M. BEULÉ does not even suggest that the Greek architects adapted their arrangements to allow of more display of the sculptors' talents. He makes PHIDIAS declare that the sculptors and painters should consider themselves happy because they are allowed to follow the architects, and to trace the histories of gods and men on the temples.

It cannot, therefore, be said that if people in the Renaissance periods occasionally allowed sculptors to design buildings, they were following the example of the Athenians in the Periclean age. No such authority was ever adduced. It may to an age like ours seem incomprehensible that costly buildings should be confided to men whose credentials were derived from the production of altar plate and tombs, tabernacles, &c. But on inquiry it will be found the custom was only a consequence of the defects of the intellectual condition of the time.

In the first place, it should be remembered that science, and especially constructive science, was confined to very few people. The Mediæval masons guarded their geometry as if it were something which could not be confided to ears of flesh and blood, unless the owner had gone through a sort of initiation which was probably accompanied by religious services. The architects of the Renaissance affected no less mystery, and in truth all learned professions posed alike as the possessors of secrets which ordinary men

were incapable to grasp. The international competition for constructing the dome of Santa Maria del Fiore, in Florence, suggests how little practical knowledge was to be found among men who were in those days accepted as experts. One competitor proposed to cover the cathedral with a sort of colossal umbrella, with a stout central column to serve as the stick. Another would fill the interior of the church with a mound of clay with a domical top, and use it as centreing, quatrini being mixed with the clay to tempt people to remove the stuff without expense. A third plan was to set up many columns from which arches would be turned to support the centreing. BRUNELLESCHI, the sculptor, who had spent about fifteen years in studying Roman vaulting and ancient methods of construction, had satisfied himself, by means of a model which he constructed in secret, that he could surmount the difficulty. But he did not bring the model forward. He preferred to display his eloquence about all he was competent to achieve, and was several times thrust out by the servants of the Syndics as a lunatic. VASARI, when writing about a century and half afterwards, does not condemn such extraordinary tactics. He approved of BRUNELLESCHI's concealment of the model, because in the sixteenth century it was so common for everyone in Florence to profess to know as much about building as the most experienced masters. The astute FILIPPO was acquainted with the ways of his fellow-citizens, and we suppose concluded that a man who would cause some astounding fiasco was worth some encouragement, for he would give occasion to jokes, and in all ages they merit appreciation. The absurd way of demonstrating his ability adopted by BRUNELLESCHI, in anticipating COLUMBUS's experiment with an egg, suggests that humour was at least as much prized as statics in Florence.

The assumption of knowledge was not confined to the Florentines. It was a weakness in many another city of Italy. The people saw a model of a church by a sculptor which resembled a tabernacle or a reliquary by him, and they concluded that if one structure was able to stand, the other was likely to be no less stable. Altars and tombs would also appear to be architectural constructions, and as they were less likely to fall out of repair than the churches containing them, the people who looked on them would be likely to conclude that the sculptors were skilful builders. In all ages, if a design appears on paper there are sure to be men who are willing to take the risk to realise it, and in Italy during the Renaissance there were builders in abundance who were competent to construct from a more grandiose design than PAUL VERONESE has introduced as a background in his *Marriage of Cana*, and without the aid of one working drawing or diagram of a joint in timber, unless of their own preparation.

It must, however, be acknowledged that, in spite of the belief in the versatility of painters and sculptors which prevailed during the Renaissance period, very few building works were directed by artists of either class. A Duke of FERRARA might order the great TITIAN to make a copy of a balustrade or to superintend the baking of majolica, but he was too shrewd a man to risk his money on the painter's experiments in architecture. It is too commonly and erroneously supposed the sculptors enjoyed a monopoly of architectural commissions. That MICHEL ANGELO was entrusted with the building of St. Peter's at Rome after BRAMANTE, PERUZZI and SAN GALLO passed away was owing to the circumstance that he was instructed to execute the monument of JULIUS II., and, as he wished to have a worthy building to contain it, he was allowed to have his own way, just as CELLINI, after making a jewelled ornament, might be asked to prepare a casket also. According to PANVINUS, the Pope "had men of all classes against him, and especially the cardinals," when the destruction of the old basilica of St. Peter was proposed; but JULIUS would not brook opposition. His ambition was to be more memorable in death than any MAUSOLUS. It was an age of topsy-turvydom, and there was some fitness in at one time seeing an old sculptor masquerading as an architect, and at another a young painter, such as RAPHAEL, in the same disguise, first getting the big commission, and then seeking for an instructor in architectural practice.

Afterwards the example set by MICHEL ANGELO, in what FERGUSON calls his "unconstructive absurdities" and

"dreadful vulgarities," was imitated by inferior men, and they occasionally contrived to convince great folks of their ability. In the history of art there is hardly a more ridiculous spectacle than that presented by the visit of BERNINI to the court of LOUIS XIV. The sculptor was invited to Paris in order to create a palace which was to surpass all that existed. His architectural experience was not, however, promising. His staircases in the piers of St. Peter's caused irreparable injuries to the dome. A tower he constructed in order to complete the façade of the building had to be demolished as soon as it was completed. But all his errors were supposed to be compensated by his fantastic figures. BERNINI was treated like a prince from the time he crossed the French boundary. Every city he passed through offered him gifts; representatives of the king were sent to greet him. But he was quickly found to be a fraud; not one of his suggestions was practicable, and although LOUIS XIV. kept up the comedy as became so fine a gentleman, there was no regret when BERNINI departed without giving any return for the enormous outlay on him.

Is it any wonder that since those days the French are not disposed to patronise sculptor-architects, or that it is now the custom when there is a competition for a memorial which is to consist of a pedestal as well as a statue to unite an architect with a sculptor? Without such a partnership the sculptor has no chance of success, for the French are not yet enough advanced to be ashamed of construction in which respect for principles is shown. Everybody knows that French sculptors are compelled to receive instruction in architecture, but although they may have that little knowledge which is often so dangerous, they cannot become owners of that wondrous "log-book" which, according to poor Mr. GILBERT, contains all the mysteries of construction worked out for the sole advantage of architects, and hence no doubt the fear of allowing a sculptor to set up any work of masonry in a French street. Neither sculptor nor architect suffers by the partnership, and it cannot be said the memorials produced by them exhibit any deterioration from the time when the sculptor, like his Renaissance predecessors, attempted to employ architectural forms which he did not understand, but dare not abandon.

## ELECTRICAL INSTALLATIONS.

BY F. J. WARDEN-STEVENS, A.M.I.E.E.

IN the previous articles\* motive-power was only briefly commented upon, and as this part of the plant for a private installation is of great importance, it may be advisable to go more fully into the matter.

### Boilers.

There are two chief classes of boilers—(1) fire-tube; (2) water-tube.

*The Fire-tube Class.*—The fire-tube boiler is one in which the water surrounds the flue or tube through which the hot gases pass. In this class are the Cornish, Lancashire and locomotive types. The Cornish and Lancashire boilers are identical, with the exception that the Lancashire boiler has two flues, and the Cornish only one.

Lancashire boilers are not very suitable for private plants, where, especially in the summer, they are only required one or two nights a week, the load being taken for the rest of the time by the accumulators. A Lancashire boiler has to be banked when not required, as the pressure, and consequently the temperature, must not be allowed to vary rapidly, as strains are caused due to unequal expansion or contraction. The coal and attention required while standing under pressure thus become of considerable importance.

A combination of the fire and water-tube boiler is the Galloway. With this boiler there are the internal flues, but in addition there are cross-water tubes in the flues which greatly increase the quantity of water that can be evaporated in a boiler of given size. The objections to this boiler when used for irregular work are the same as with the Lancashire.

The locomotive or multitubular boiler in its various

\* See *Architect*, vol. LVI.

forms is the most suitable of this class for irregular work, although the firebox, which is usually made of copper, is not placed so favourably with regard to evaporation as it is in the Lancashire boiler. The hot gases pass through a large number of parallel tubes, which, as it were, correspond to the two flues in the Lancashire. There is, therefore, a very large heating surface, and this boiler is not damaged easily by rapid steaming, and the fire need not be banked when standing idle. These qualities are all very favourable for a private plant. The only objection to these boilers is that the firebox is so constructed as to render the operation of removing clinkers very difficult without allowing the pressure to fall seriously.

*The Water-tube Class.*—To this class belong all those in which the tubes contain the water and round which the flames or hot gases pass, this being the reverse of the fire-tube type. There have been many kinds of these boilers introduced, but the difficulties have been chiefly the question of the circulation and that of unsuitable water, and the difficulty of cleaning out deposits of carbonates, &c. The best known water-tube boiler is the BABCOCK & WILCOX, although there are now several kinds which are very satisfactory when worked under suitable conditions as to water, &c., but they all require a considerable amount of attention while working. Some types can be steamed up from cold in half an hour, but for a private plant one should be chosen which has a large water and steam-space, as it is not necessary that it should be steamed up in such a short time as is possible with some water-tube boilers.

The water-tube boiler is, generally speaking, much safer than the fire-tube, as the tubes are smaller and stronger and there is no need for an outside shell, as is the case with the latter. The difficulties of working are not so great as with Lancashire boilers when under inexperienced hands, as they cannot be easily damaged.

The water available should be tested by an engineer to find the proportions of carbonates, &c., which are in the water, and if high, a Lancashire or Cornish boiler should be used.

#### *Steam Turbines.*

The steam turbine is coming into use for private plants where economy of space is of importance, and it is to be recommended on the ground of compactness, freedom from vibration and cheapness. They need no foundations, and are used when placed (not bolted) on rubber blocks.

There are two types of turbo-generators, as they are sometimes called—the reaction and the impulse. The reaction turbine has been developed by the Hon. C. A. PARSONS, of Newcastle, and works exactly in the same way as a reaction water turbine. They are made both parallel and radial flow, the steam expands in a series of small turbines and economy is attained with a comparatively slow speed. It is, in fact, similar to a multiple expansion water turbine; the speed of a 50 horse-power turbine is about 8,000 revolutions per minute, and the dynamo is direct coupled.

The disadvantage is that the blades on the revolving wheel sometimes come off and the steam passes only through the wheel. If the clearance allowed is too great the turbine works uneconomically, and if the clearance is too small the revolving and fixed blades are apt to scrape, and one or other is torn off. The governing is perfect, and the whole machine is very ingenious and of high-class workmanship.

The impulse turbine is a development of the first steam-engine, HIERO's wheel, and again is similar to the impulse water turbine, and very similar to the Pelton wheel. A small wheel revolves at a high rate of speed, it has channels cut on its periphery, and steam nozzles are arranged to play on to these. There is only one wheel, and the steam is under atmospheric pressure when it leaves the nozzle. The whole of the energy of the steam is kinetic (or the energy of motion), and a great part of this is given up to the revolving wheel. The economy of this turbine is about the same as that of a reaction turbine. This turbine has been developed by DE-LAVAL, of Stockholm. It runs at a speed of about 25,000 revolutions per minute, and, as this speed is considered too high for electrical machinery, a very efficient helical gear is used, which appears to work noiselessly at this tremendous speed. The steady, smooth

running is attributed to the flexible steel shaft on which the wheel runs, and to perfect workmanship.

#### *Gas-engines.*

The horizontal type of gas-engine has been most frequently adopted, but vertical high-speed gas-engines directly coupled to their dynamos are now being used to some extent, and the unsteadiness in the light is so far removed in at least one type of engine that, it is claimed, accumulators may be dispensed with. The advantages of a high-speed gas-engine are compactness, possibility of direct coupling, greater economy of gas owing to more frequent impulses, and consequently more steadiness of light. The faster a piston moves immediately after the explosion the greater the economy of the engine. There is also less need for a water-jacket in consequence of the more frequent impulses, as there is a greater proportion of energy utilised as work, and less heat is transmitted to the cylinder walls. In a vertical engine the cylinders have not the tendency to wear oval, as is the case in a horizontal engine.

#### *Water Turbines.*

Where the fall is low it is of importance to have a turbine which will run at as high a speed as possible. This often allows of a direct belt or rope drive without the intervention of countershafting. The turbine for a given power is smaller, and in consequence less costly, and the size of wheel-pit, &c., can be less. The most suitable class of turbine for such a case is the inward and downward flow type which has a vertical shaft.

The belt will not leave the turbine pulley or the dynamo pulley if the following condition of running is complied with, *i.e.* that the belt shall feed on to each pulley at a right angle to its axis. By this means the expense of bevel gearing, countershafting and clutches is avoided, while there is much less loss in friction.

### THE GIZEH MUSEUM.

A CORRESPONDENT of the *Leeds Mercury*, writing from Cairo on January 23, says:—

Four hundred and fifty-six years before the birth of Christ Herodotus wrote of Egypt:—"I shall now speak at greater length of Egypt, as it contains more wonders than any other land, and is pre-eminent above all the countries in the world for works that one can hardly describe." That is true to-day. At every step we encounter venerable monuments which have survived the destructive influences of thousands of years better than the vandalism of the invaders and conquerors whose religion has been at variance with that of the ancient Egyptians. In spite, then, of time and of other influences tending to destruction, there are works still remaining which have existed for forty or fifty centuries in comparison with which the works of all other nations are modern. The skill displayed in their execution is still more marvellous, and would indicate that they were the outcome of antecedent ages, all memorials of which are now buried in the obscurity of the most remote antiquity. I do not propose to write at length upon these world-famed monuments, but of a collection of antiquities gathered together in one building within the lifetime of many still living. I should like to attempt something of a description.

As I may have to speak of the disservice of France and Frenchmen to this country in a later letter, I wish here to pay my tribute of thanks to two Frenchmen, namely, M.M. A. Mariette and M. G. Maspero, who must have all the credit of the founding of a museum which is, without doubt, the largest and richest collection of antiquities in the world. These two men gave their lives to the formation of this most valuable collection. Mariette and Maspero sought and found hidden treasures, and Maspero organised a system of encouraging others to go and do likewise, with this proviso, that the half, at least, should remain for the enrichment of the museum now in the Gizeh Palace. Further, it was within the knowledge of the Department of Antiquities, of which Maspero was the head, that valuable relics of bygone ages were finding their way to London, Paris, Berlin and Vienna. They determined to stop this, and were also wishful to know whence such treasures were obtained. To the authorities, inspired by the chief, it was all important that this should be ascertained, for they knew they belonged to the Nineteenth Dynasty—the time of Rameses II. and of Seti I., his father, and of Rameses I., his grandfather. Even scarabæi, bearing the cartouche of the greatest of all the Pharaohs, Rameses II., were displayed by the innocent but lucky purchasers. This being so, argued Maspero, the mummies of those royal personages must have been discovered by

someone. By whom? A detective force, spies in fact, was organised to help in the solution of this interesting question. At Port Said, an Arab was negotiating for the sale of the "Book of the Dead," from one of the mummy cases of a Pharaoh of the Nineteenth Dynasty—that is fifteen centuries before Christ. He was arrested, the bastinado was applied almost daily for three months, when the Arab informed the authorities that it was quite true what he had all along declared, that he did not know where the papyrus was obtained, but his brother knew. This famous brother was Abd-er-Rasoul, who supplied guides and donkeys to tourists visiting the ruins of Thebes. He was arrested and imprisoned, and finally "bakshish" brought out the confession that he would show the authorities the tombs from which, as it proved, his family and that of his ancestors had abstracted the plunder on which they had been living for five or six generations.

Let me tell the story of the finding of Pharaoh as it was told to me by Brugsch Bey some ten years ago:—"One of the brothers accompanied me to the tombs at Deir-el-Bahri, and pointed out an opening in the ground, a square shaft, filled up with loose stones, evidently placed there by the owners of the secret. We procured a staff of labourers and cleared the shaft, some 40 feet deep. From the bottom of the shaft I proceeded along a subterranean passage directly into the heart of the mountain. This passage terminated in a mortuary chamber about 13 by 23 feet, and not quite 6 feet in height. I soon satisfied myself that we were on the eve of an event even in the annals of discoveries in Egypt. Pieces of broken mummy cases and fragments of linen bandages strewed the floor. Against the walls were statuettes, libation jars of bronze and also of terra-cotta, canopic vases of precious Lycopollitan alabaster, and in a tumbled heap lay the funeral canopy of Queen Isi-em-Kheb. There were some beautiful mummy cases, entire, fashioned in human form, with folded hands and solemn faces with ever wakeful eyes, each emblazoned with the name and titles of its occupant. My first reading, by the flickering candles, was that of Queen Hathoc Houttani, wife of Pinc-tein I. My sensations in that moment it is impossible to describe. Then came Seti I., the father of Rameses the Great, and finally Rameses the Great himself—the undoubted Pharaoh of the Oppression. This was too much for my nerves, and I literally fainted."

Can you imagine it? A man of the nineteenth century, learned in the mythical, symbolical and mysterious characters of thirty centuries before Christ, brought face to face with the greatest of the great kings of Pharaonic Egypt, was more than bewildered. When Brugsch Bey came round from his faint he told me he was impressed with the idea that he had been dreaming, and requested his men to retrace with him their steps and return to the light of day. The brother-in-law of Brugsch Bey was at the surface when the party came out, and he assured me the face of his brother was white, as he thought with fear. The whole find was finally removed to the museum in Cairo, where they now lie in state for the tourist and the student to gaze upon. Bewildering to both the sight must for ever be.

I mentioned the funeral canopy of Queen Isi-em-Kheb. It is a magnificent and unique specimen of appliqué embroidery in cut leather, made some 3,000 years ago, the rich colours quite fresh and rich in their blendings and contrasts. This lady, when buried, was provided with a sumptuous repast, consisting of gazelle haunches, trussed geese, calves' heads, dried grapes, dates, nuts and the like, all being mummified and bandaged, the whole packed in a rush hamper which would not disgrace the best-equipped drag that ever went on to the course at Epsom, and sealed with her husband's unbroken seal. Her toilet was not forgotten, for with her were found her ointment bottles, a set of alabaster cups, some goblets of exquisite variegated glass, above all her mirror in oval disc of copper—once polished to such perfection as to reflect the face almost as well as the modern mirrors—all for her use and adornment beyond the grave, or at that supreme hour of bodily resurrection when, clothed in regal pomp, fed and anointed, she should go forth from the dark sepulchre into the glorious light of everlasting day.

It is almost past belief that within a palace mostly constructed of lath and plaster, containing nearly 500 rooms, and built by the grandfather of the present Khedive, Ismail Pasha, for his women, there should be gathered together the mortal remains of kings and queens and priests, rulers of this land thirty and forty centuries ago, with statuary of far older date, affording ample proof of the capacity of Egyptian sculptors to execute really artistic work. The golden ornaments of the Princess Hathor, found by Mr. De Morgan in March, 1894, in the north pyramid at Dahshur, are a proof of the high pitch attained by the Egyptian goldsmiths two thousand years B.C. They form one of the chief attractions of the Gizeh Museum; and the find, being of very recent date, gives one hopes of further discoveries in the near future under the guidance of the present energetic director of the Museum of National Antiquities.

In 1893 the tomb of Mera was discovered and opened out. It yielded very little for the museum, but the tomb itself is at Sakkarā, quite near to the famous Tomb of Ti and the equally famous Tomb of the Bulls. It consists of thirty-one chambers and passages, all adorned with highly interesting and diversified reliefs, some of which show representations not found elsewhere. There is now no difficulty in entering either the Tomb of Ti or that of Mera, as inclined roads have been made to the underground chambers with a proper door, with lock and key, and every care is taken of the interesting representations of the past times and occupations of the ancient Egyptians. The hieroglyphical scenes which cover the walls of all the chambers are in delicate bas-relief, the outlines being sharp and distinct, while the projecting parts are at the same time subdued and harmonious.

It is conjectured that every Egyptian of the Ancient, Middle and Modern Empire, of moderate means, and particularly the great and wealthy, began during his lifetime to plan the construction of a tomb worthy of his position. When the architect had lined the interior with faced lime, stone, or granite, the artist commenced to draw upon the walls the various groups of men and animals. Hunting, shooting and fishing scenes, boat-building and pastoral life are the most prominent in the tombs I have seen. The owner of the tomb would spend days in it, in a chair of state, watching and directing the progress of the work. After his death his remains would be deposited in some suitable sarcophagus, and the tomb, even in its unfinished state, would be closed, and thus it is that the most perfect sculptures are to be seen in close proximity to the designs, only in red chalk. It is from such tombs that the collection at Gizeh has been made. The statues of the owners have been removed to safe keeping under the watchful eyes of the authorities, although the intention of the pious founder was to lie in the position and amid the surroundings arranged with such care during his lifetime, until the day when the soul would again inhabit its frail body and put on immortality.

I am glad to find that it is the intention of the Government to build a museum of stone and iron fitting the importance of the collection. A fire at Gizeh, such is the flimsy character of the material used in the construction of the present building, would speedily destroy it, and thus its treasures, which have defied the hand of time, would become a mass of worthless burnt stone, whereas, if preserved, it is a collection of the most ancient and interesting character in the known world, and well worth a journey to Egypt even if that was all the traveller could see.

## BILLS OF QUANTITIES IN AMERICA.

IF a national system of estimating on bills of quantities or some equivalent be recognised by leading architects and contractors, says Mr. G. A. Wright in the *American Architect*, this matter will adjust itself. If architects point out the necessity for quantities and contractors decline to estimate without them there will be no difficulty, but we cannot expect this at the outset, although, if once adopted, it will eventually come to this. One point for the owner's advantage is that they pay for no more material than their buildings require, and in cases of changes or variations in contracts they can easily know definitely beforehand what the cost of such changes will be.

The architect would have in his possession the builder's original bill of quantities, priced in detail, each item, this document having been sealed up and handed to him by the contractor when signing the contract, the practice being that it should only be opened in the presence of the contractor and immediately sealed again.

The quantity surveyor having prepared what is known as a "variation" bill of quantities, the items would be valued at the original contract prices, and the cost of such contemplated changes would immediately become known.

A certain class of contractors are ever ready in these days to have changes made—originate them if they can—knowing that, as a rule, an owner would prefer to pay a good price rather than go to law when the bill for "extras" comes in. Such men make more money out of the changes, perhaps, than out of the original contract, but by the quantity system the owner is protected and his changes are paid for at "competition" prices, the same as the balance of the contract, and this is an advantage to the owner and a saving of some trouble to the architect. And here is another point—Is it fair to the architect that he should have to measure and value variations in contracts, and have his time taken up in settling disputes with contractors? This work might well be relegated to surveyors whose special business it is, and who would give it special attention; and experience has taught me that it would be to an owner's and to an architect's advantage to have their extras and omissions accounts settled in this way.

But, to return, if quantities be furnished, I believe lower bids would be received from the competent and honest contractor;

the incompetent and irresponsible ones would immediately recognise from the very wording of the quantities that they would have to "toe the line" or not bid at all. What the "quantities" say would control the character of the work done. Good work would be easier to obtain because everything would be plainly stated in black and white and by sketches where necessary, and can it be denied that this would benefit the owner and make the architect's work run more smoothly?

Again, the estimate is more accurate, and so there is less inducement for a contractor to withdraw a bid or to scamp his work.

All such points as I illustrate are benefits to the owner. I think the owners would see the advantages if put before them fairly. I once heard it remarked by perhaps the cleverest quantity surveyor in his time (H. P. Foster, of the Adelphi, London), that a correct estimate is first cousin to a correct design, and I believe he was right, for when an owner wants an estimate he wants a correct one (assuming he is honest), and the design and its cost are closely related, if both are correct.

Now a correct estimate without correct quantities is an absolute impossibility. Contractors cannot reasonably be expected to make such quantities; they may get something on paper, but such work would oftentimes fall very short of accuracy. As it is now, owners are usually none the wiser; but that does not justify a continuance of the practice.

It is unreasonable to expect accurate quantities of all trades from a contractor unless he has had training essential to such work, and so the owner, if only for his own personal interests, should come out and say plainly, "I want so much work done, what will it cost?"

The combination of trades called the building business is entirely different from any other business. There is no other business like it, or that calls for such a diversity of craftsmen as it does, and its complexity where "estimating" is concerned is not to be found elsewhere, so far as I know; and so when an owner says, "What will my building cost?" without giving particulars of how much he wants put into it, he is asking a great deal, although it is quite possible that this never occurs to him. But he should be told, and moreover should bear some of the responsibility by stating, as I say, how much of each material he wants used, without throwing all the onus upon the contractor, for this is no more the contractor's duty than it is the architect's.

An owner may decline to build on receiving bids upon any pretence; he may in his heart never have intended to build at all unless he saw a chance of getting two dollars of a builder's money for one of his own, and yet he now gets his estimate for nothing. This does really seem absurd. An owner pays (or should pay) his architect for what work he may do, and if owners can be made to see the advantages to themselves of the quantity system, they should be willing to pay for the quantities also. Such a practice, when the justice of it became understood, would not prevent honest owners from building, but it might deter the "grasping" owner (the man who imagines the architect's special duty is to help him to rob the builder); it might deter these men from defrauding builders out of their time and experience, as is often the case under present conditions.

If an owner obtains bids in competition, I maintain that he does get information which is necessary and of value to him or he would not try to get it. The fact that he himself has not sufficient means (or is otherwise unable) to put up his building is no justification for not accepting his proper share of the responsibility, and this share is to pay for the quantities if the builders are willing to give their time and experience in figuring them out. Surely that is sufficient for them to give.

Let me add a word about the English practice.

The courts recognise this fact, that when an owner instructs an architect to obtain estimates from contractors, the architect, as the owner's agent, has an implied authority to employ a quantity surveyor to prepare bills of quantities, for the reason that without these, it is impossible to obtain a proper estimate. Such is the "custom" of the architectural profession. I have in my practice had cases where an owner did not want to pay my fees because he did not build, but in view of the many precedents established by the courts there was never any difficulty in successfully establishing my claims.

Quantities are a necessity. Without them, the best firms of English contractors always refuse to bid. It is, in fact, quite the exception for them to be asked to do so, and then it would be for small jobs only. I will not be positive, but I believe one of the rules of the Master Builders' Association of Great Britain is, that members are not to submit bids unless owners furnish quantities. You would not see these men wasting their time "figuring," as builders do here, or as I have seen them doing the last six years; yet I firmly believe these very men would be the first to realise the immense advantage the system would be to themselves, if the subject were only properly ventilated by the Institutes of Architects and the builders' exchanges of this great country.

## NORTHERN ARCHITECTURAL ASSOCIATION.

A MEETING of the members of the Northern Architectural Association was held on the 3rd inst., at the Art Gallery, Newcastle, Mr. F. W. Rich in the chair.

The Chairman proposed the following resolution:—"The Northern Architectural Association, looking to the amount of public interest and criticism that has arisen respecting the proposed restoration of the western front of the cathedral, Peterborough, desire to convey to the Dean and Chapter their appreciation of the course pursued by them in upholding and carrying out the advice of their architects—Mr. J. L. Pearson and Sir Arthur Blomfield—and however much the Northern Architectural Association may regret the circumstances that necessitate the pulling-down part of the work, yet feel sure that in the hands of such an experienced and able man as Mr. Pearson there will be nothing done without cause." He said there had been a great deal of amateur criticism on this matter, and the more architects stood up against these innovations on the part of amateurs the better it would be for themselves.

Mr. Reay seconded the motion, which was cordially agreed to.

Mr. Frank Caws, F.R.I.B.A., of Sunderland, read a paper on "The Probable Influence of the Technical Education Movement upon the Architect and his Work." Mr. Caws began by pointing out that his profession could boast of many noble achievements, but as to whether its future would eclipse its past depended upon whether it will or will not continue to advance on the crest of the unrelenting wave of human progress. Others, from princes of the royal blood downwards, had been more or less active in this great movement for technical education, while architects had scarcely taken a place in their counsels. This he attributed to declension long continued through recent centuries, slow but sure, on the part of members of his profession who had too much devoted their time to the pursuit of artistic trifles, while the great works of this age had passed from them to the modern race of civil engineers. Yet the blame was not wholly the architects'. In proving this he showed how this mighty movement which they called technical education was started in England by the late Prince Consort (whom Mr. Caws eulogised for the impetus he gave to the industrial arts and sciences in England), who in carrying out his scheme for the exhibition building of 1851 selected not an architect but a gardener—Sir Joseph Paxton. Again, in designing the exhibition of 1862, the Prince Consort passed by the architectural profession and chose Captain Fowke of the Royal Engineers. This neglecting of the architects was not because there was any lack of ability in their ranks, but because the Prince had formed an erroneous estimate of their readiness to undertake great works, for, as the Prince himself observed, "If I ask an architect to carry out any extraordinary new design, he hums and haws, but if I ask an engineer he at once sets about it." By the opening of the great exhibition of 1851 technical education received its initial impulse in this country, though not then recognised by that name. But to this turning away of the Prince from the architectural profession at the outset of his magnificent enterprise may be attributed much of the subsequent apathy of the profession towards the technical education movement—a fact to be lamented, while giving the Prince every praise for the great work he initiated. The time had now arrived when architects as a body should put aside this lukewarmness towards the great educational movements which Albert the Good, to his everlasting honour, began. Architects should take deep interest in the technical education movement because of the splendid opportunities it afforded for developing the talents of the young, and not from the merely selfish motive that it helped us to remain masters of the markets of the world, but because it tended to increase the happiness of men and women by increasing their knowledge and usefulness, and particularly by giving them a deeper insight and interest in their work, and so minimising the monotonous drudgery of their lives. Technical education could not long continue without thus raising the status and character of the worker, thereby inducing a general gain of intelligence, skill and respectability in all trades and handicrafts. If the architectural profession would not remain hopelessly behind other crafts and professions, if architects would retain the proud position of masters of the technical arts—which the very name of architect implied—then they must bestir themselves and take advantage of the great opportunities the present moment afforded. How to do this Mr. Caws explained by showing how architects' pupils and students should devote the years of their apprenticeship so as to attain to the higher standard of qualification now called for. The dandy and idler who considered it *infra dig.* to spend their evenings side by side with the young artisan in the technical college or art school must disappear from the ranks of the profession, for entire devotion to his art, under certain specified restrictions and conditions, was the only true road to the student's success. He went on to point out that the division of labour which characterised nearly every craft at the present day was a necessity of our increasing

civilisation; but he put this forward as the strongest reason why the architect should take every advantage of the technical education movement, the architect being, as it were, the natural centre towards which the industrial arts and trades radiated. In a word, while others may know parts, the architect must know the whole, for he it was who must guide and control the complicated machine of technical labour, and must arrange the fitting of its human parts so as to produce a harmonious result in every building, great or small, fitly framed together, and compacted by that which every joist supports into monuments of human energy, skill and combination. Mr. Caws closed his paper by specially addressing the students thus:—You who are here to-night who are young, and who have so much to learn and to do, you, by the help of these splendidly-organised schools, may and must increase, while others of us here who are no longer young, and who have learnt and done what we could with the much smaller aids at our command, must decrease. None the less do we rejoice that you young students enjoy opportunities not granted to us, and all the more we urge you to use them well, and in conclusion we would bid you and those glorious institutions which are ready now to help you God speed.

A hearty vote of thanks was accorded to Mr. Caws, after which the meeting terminated.

### ARCHITECTURAL ASSOCIATION OF IRELAND.

A MEETING of the above Association was held on the 2nd inst. at the Grosvenor Hotel, Dublin, Mr. R. Caulfield Orpen, president, in the chair, and among those present were Mr. T. Drew, Mr. W. G. Doolin and about forty members. A very interesting lecture was given by Mr. W. J. Fennell of Belfast, on "Some Old Buildings in Antrim and Down," which was illustrated by lantern. The lecturer gave some detailed accounts of the ruins at Holywood, county Down, the old churches at Newtownards and Movilla, and the very picturesque ruins of the old Cistercian Abbey, known as Grey Abbey, the Castle of Dundrum, the Cistercian Abbey known as Inch Abbey, and thence on to the historic town of Carrickfergus, with its fine old church of St. Nicholas; Antrim, with one of the best preserved round towers in Ireland, 92 feet high and 50 feet wide at the base; Ballycastle, with its old abbey and gate-house, and the extremely interesting stronghold of the McDonnells, Dunluce Castle. Mr. T. Drew having proposed, and Mr. McGloughlin seconded, the vote of thanks, and Mr. W. G. Doolin having spoken and shown a few views by lantern, the Chairman announced the next meeting for the 16th inst., when Mr. F. Batchelor will lecture on "Hospitals and Hospital Construction." The drawings by members of the advanced class of design (the subject being a village public-house) were hung in the room and attracted much attention.

### LIVERPOOL ARCHITECTURAL SOCIETY.

THE fifth ordinary meeting of this Society for the present session, held on the 1st inst. in the Law Library, Union Court, under the chairmanship of Mr. Bradbury, the president, was well attended. The feature of the evening was a paper by Mr. F. I. Thomas entitled "Art Out of Doors," in illustration of which some sixty photographic views were shown by lime-light. These, which were beautiful in themselves as works of photographic art, had been admirably selected so as to indicate the multiplicity of country seats throughout Great Britain in which architectural and horticultural art derive great attraction from their natural surroundings. The lecturer was warmly and deservedly thanked.

### SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE monthly meeting of the members of the above Society was held at the School of Art, Arundel Street, on the 9th inst., when Mr. John Slater, B.A., gave a lecture on "The Buildings of the Ancients." Mr. C. Hadfield (president), occupied the chair.

Mr. Slater quoted the late Mr. Fergusson's remark that beauty in architecture consisted not so much in particular features as in appropriateness of design and elegance of detail. In the present century there had been many changes of style. Each successive period had found ugly and unsuitable what had been praised as fit and beautiful by its predecessor, thus showing the narrowmindedness of those who posed as the directors of the public in matters of taste. It might not be uninteresting to go back to a time anterior to all the recognised styles, and see what kind of buildings were erected by the ancients, when the sole object was to meet the requirements of the people for whom the building was intended, and who obtained architectural effect by ornamenting their construction, and not by constructing their ornament. The

first builders who attained to any great architectural skill were the Egyptians, in whose history four periods stood out as those of great architectural activity. These periods were the fourth dynasty, when the great Pyramids were erected; the twelfth dynasty, to which belonged the tombs at Beni Hassan; the period when Thebes was at the zenith of her power; and the period of the Ptolemies. Details were given of the construction of the Pyramids, showing that the most scientific precautions were taken to prevent the heavy superincumbent mass from crushing in the sepulchral chambers. In the tombs of Beni Hassan it was noticeable how often wooden forms were reproduced in stone. In these tombs were to be found the prototype of the Doric column, as well as of the plan of the perfected Greek temple. The enormous Temple of Karnak, with its hypostyle hall, was described, and so were the different forms of capitals found there. The great feature of the Egyptian temples was their solidity and massiveness, but relieved by the most elaborate and varied system of colouring, the granite columns having been coated with stucco before the application of the colour decoration. Crossing from Africa to Asia different materials and methods of building were found, sun-dried and burnt bricks forming, in the absence of stone, the staple building materials. In consequence of the friable nature of these materials there existed for many centuries nothing but heaps of rubbish to mark the sites of some of the most notable buildings of antiquity. Quite recently the most valuable and interesting discoveries had rewarded the exertions of explorers. No less than seven palaces of the Ninivite kings, whose dynasty lasted from B.C. 1250 to B.C. 625, had been exhumed, the most complete and interesting being that of King Sargon at Khorsabad, which was thoroughly explored by Messrs. Botta and Place. Here were discovered the most magnificent arched gateways of brick, arched covers to sewers and conduits, and enamelled encaustic tiles of different colours and patterns, which were as fresh and vivid as if they had only recently been taken from the kilns. The exact manner in which these large buildings were lighted was largely a matter of conjecture. The third great building people of antiquity were the Persians, whose supremacy in Central Asia dated from about the sixth century B.C. The rocky plateau of Persepolis was the site of the most magnificent palaces of the kings, and the ruins still existed to testify to their grandeur. In the recently-explored Hall of the Hundred Columns, the columns were of marble, the capitals being the well-known double bull's head, between which rested the beams supporting the roof. The height of the columns, 67 feet 4 inches, was more than double the height of the columns of the Parthenon. The bases of the Persepolitan columns were particularly graceful, and it was rather curious that this form had never been adopted by the Greeks. The curious and interesting domed buildings at Feruz-abud and Sarvistan, the dates of which it was difficult to determine, were almost certainly the precursors of the Mohammedan mosques. From the wall decorations discovered by M. Dieulafoy, it was certain that the Persians, like the Assyrians, had arrived at a high pitch of excellence in the manufacture of glazed enamelled tiles. After alluding to recent discoveries in the district anciently called Phrygia, and to some curious examples of the exact imitation of wooden forms in stone, the lecturer concluded by saying:—As the byways of the world become opened up to us, we are continually finding unexpected remains of building nations, and it is not too much to say that wherever over the whole face of the earth explorers have come upon the relics in stone or brick of a remote civilisation, their wonder has been excited at the solidity, and in many cases the high artistic quality, of the work. It appears to me that, despite all our modern resources and all the discoveries of science in these latter days, no one can study such buildings as I have brought to your notice this evening without having a little of his nineteenth-century conceit taken out of him; for truly all the remains testify that in energy and in intelligence and in skill there must have been giants in those days.

The paper was illustrated by a number of large diagrams prepared by Mr. Slater.

### ST. MARY'S CHURCH, WARWICK.

THE cost of the restoration of this church has been greater than was anticipated, and at a meeting under the presidency of the Earl of Warwick which was held at the Court-house last week, the Rev. A. C. Irvine read a report which stated that under the scheme approved in 1894 the galleries and pews have been removed, the new floor laid, the cleaning and repair of the walls and ceiling completed, and structural preparations made for the erection of the organ and parts of the instrument ordered. For the repair and restoration of the church and tower 13,637*l.* 4*s.* 9*d.* has been since 1884 contributed and expended. But an additional sum of 2,550*l.* is still required to discharge liabilities already incurred and complete the work contemplated.

### NOTES AND COMMENTS.

MANY artists and amateurs will hear with regret of the death of M. HARO, who was one of the best known of the experts in all disputes about art in Paris. He died on Friday in his sixty-ninth year. But he was so closely associated with French art, it was difficult to believe that the "good old chronicler" was not in business at the beginning of the century. His shop in the Rue Bonaparte revived associations with EUGÈNE DELACROIX, INGRES and other mighty men of the Quartier Latin. Another on the Boulevard suggested more modern art and fashion. His fine house in the Champs-Élysées, to which an Englishman was always a welcome visitor, suggested to many a millionaire what wealth can do in the accumulation of treasures. M. HARO was an excellent type of the skilled dealer. He was well up in the history of the French school and had a keen eye for the good and weak points in a picture. A thorough man of business, he was selected to be official publisher by the Municipality. He is succeeded by his son, M. HENRI HARO, who has directed the establishments of late years.

THE Boulevard Anspach in Brussels owes its architectural character to the prizes offered by the Municipality to the owners who erected the most handsome buildings. The Paris Municipal Council are not too proud to take a lesson from the Belgian capital. Three prizes will be given for "les plus belles façades" in the new Rue Réaumur. It is not a question of convenience or economy that will be considered, but simply what will most contribute to the amenity of the district. Although the new street was opened on Friday last it was projected in 1851, when two small streets were united and called the Rue Réaumur. A little advance was made in 1854 and 1858, but it was only under the present Republic that the extension to the Bourse was arranged. A sum of 2,000,000*fr.* was voted, but owing in a great measure to the assiduity of M. PIERRON, the architect who had charge of the purchase of property and other works, about half a million has been unused. It is the first time in municipal affairs for so large a percentage to be saved. The street will offer many opportunities to architects and builders, for it will be much frequented when completed.

It has been decided that a section of retrospective art will be one of the features of the international exhibition of 1900. France alone will be represented. The choice and arrangements will be conducted by two special commissions. To some extent the precedent of 1867 will be followed. The first work to be done will be the preparation of a catalogue of the principal works which have figured in Salon exhibitions since the beginning of the century. It will then be determined in what way they can be exhibited, in order to clearly show the progress of French art. When the preliminary work is complete, applications will be made for the loan of those works which have been purchased by the State and are deposited in public galleries in Paris and provincial cities. Private collectors will also be requested to contribute. The arrangement is systematic, and it may be said to be thoroughly French also. It is certain to be successful.

THE Palais de l'Industrie, in which the Salon exhibitions were held since the formation of the Society of French Artists, is now in the hands of the demolishers. M. DAVAL has purchased the materials (with a few exceptions) for 255,225 francs, or over 10,000*l.* The area occupied by the building is 36,000 metres and the whole must be cleared in six months. The work cannot be continuous. A part must be spared during the next Salon exhibition. The cast-iron columns and girders of the great hall are to be broken as soon as taken down in order to facilitate carriage, and the fragments sent direct to the foundry. It is calculated by the contractor that about 350 labourers will have to be employed, and there will also be smiths, glaziers, carpenters, in order to preserve some of the parts which can be sold as they stand. Some of the stone, such as "Saint Maximin,"

which came from quarries that are exhausted, will be likely to obtain a high price from builders.

In the last week of April the French School of Athens will hold a conference at which the following subjects will be discussed:—(1) Methods to be observed in the search for ancient monuments and their preservation when found; (2) means to be employed to facilitate archaeological work and render it expeditious and more fruitful; (3) archaeological teaching. The school was founded by an ordinance of LOUIS PHILIPPE issued on September 13, 1846. It has therefore completed its half-century. The main object then sought was the study of architecture, for as SAINTE-BEUVE said at the time, "Architecture reigns in Athens in its most majestic developments, and if Rome is the home for a school of painting, the most natural centre for architecture is Athens." It was also proposed to send there some students of philology. The dream of SAINTE-BEUVE was to have the choruses of the "Œdipus" read at Colonus and those of the "Ion" at Delphi, the odes of PINDAR studied in presence of the places celebrated in them, a great historian followed systematically over the region of a campaign, and the victorious course of EPAMINONDAS followed through Arcadia with a "Xenophon" for guide. But in those days a Frenchman never thought it was necessary to take part in excavations for the advancement of archaeology. Now the French School is distinguished by its enterprise, and has succeeded in revealing much of the ancient world which is interesting.

In Scotland hydropathic establishments are rivals of the hotels, for they generally occupy picturesque positions and visitors find them to be economical. Some time since one in the Trossachs was destroyed by fire. The owners were bound to erect another of such a value as to produce 15,000*l.* if the building was offered for sale. Plans were accordingly prepared, but the ground landlords considered they were inadequate to the requirements. Application was made to the Scottish Courts, and a report on the plans was ordered to be made by Mr. PEDDIE, of Edinburgh. It stated that the building for which plans had been prepared, and which had been or was about to be commenced, was not a building which would satisfy the conditions, and that therefore the defendants had not commenced the erection of exactly that class of building required by the judgment of the Court within three months of that judgment. Lord KYLLACHY, the judge, said it was suggested that value meant cost or outlay judiciously expended; but he did not understand how money could be judiciously expended if what was produced was worthless, or not worth the money expended. It appeared to him that the terms, and certainly the substance, of the Court's judgment would be satisfied if a building were erected which, if it had been originally built, would have satisfied the ground landlord's obligation. "What's the worth of anything but so much money as 'twill bring" is an old rhyme, and it is interesting to find that the idea has inspired a judgment in the Scottish Courts. Political economists may not agree with the terms; but to make sure of a market value of 15,000*l.* a very much larger sum will have to be expended on the buildings.

It is not always easy to understand in the south all the peculiarities of the Scottish system of measurement and quantity-taking. For example, why should one rule be in force for paying the measuring of masonry and another for woodwork? Messrs. JAMES HAY & SON lately requested the work and paving committee of the Dundee Police Commission to repay them one-half of the fee for remeasuring the joiner-work of the Municipal Buildings paid by them to Mr. CAMPBELL, on the ground that the contractor for the mason-work had received from the Commissioners one-half the fee paid. The committee refused the application as the terms of the contracts were entirely different, and the Commissioners were not liable for payment of any part of the fee for measuring the joiner-work. A bargain is a bargain, but evidently the contractor for the joinery considered that in equity he had a claim on the half-fee.

ELY CATHEDRAL—NORTH AISLE, LOOKING WEST.

THE APSE AT CHRIST CHURCH, CHELTENHAM.

"Fresco secco" is the method adopted in the execution of this work by Mr. RICHMOND, R.A., and Mr. J. EADIE REID. The CHRIST is seated on a great throne, from underneath which flows the stream of living water. On either side are seated the twelve apostles. Over the richly carved arcade are crowds of adoring angels. Their richly coloured wings interlace until the tips touch the orb of the golden sun. In the soffit of the arch—unfortunately not shown in the photograph—St. MICHAEL and St. GEORGE are seated guarding on either side. The silver moon is here shown as typical of death, in contrast to the eternal life pictured in the half dome. The subjects in the lower panels are "The Annunciation," "The Meeting of the VIRGIN and St. ELIZABETH," "The Presentation in the Temple," "The VIRGIN and CHILD accompanied by St. JOSEPH." The altar-piece illustrates "The Easter Morning." Messrs. MIDDLETON, PROTHERO & PHILLOTT, of Cheltenham, are the architects.

THE CHANCEL PAINTINGS AT SS. PHILIP AND JAMES,  
UPPER HATFIELD, NEAR CHELTENHAM.

THESE paintings are painted in the same medium—fresco secco—as that employed in the work at Christ Church. There is, besides the panels illustrated, a large fresco in the choir—CHRIST amongst the Doctors. The work has been designed and painted by Mr. J. EADIE REID, who has also schemed the decorations of the nave and choir. Messrs. MIDDLETON, PROTHERO & PHILLOTT, Cheltenham, are the architects.

ALTAR SCREEN, ST. SAVIOUR'S, SOUTHWARK.

IF historic, legendary and poetic associations were of any avail, the Priory Church of St. Mary Overie in Southwark ought to be one of the best preserved in England. Its history, as related by JOHN STOW, has a new interest at a time when the building is about to be once more brought into connection with English royalty. In his description of Bridge Ward Without, STOW writes:—

East from the Bishop of Winchester's house, directly over against it, standeth a fair church called St. Mary over the Rie, or Overie, that is, over the water. This church, or some other in place thereof, was of old time, long before the Conquest, a house of sisters, founded by a maiden named Mary; unto the which house and sisters she left (as was left to her by her parents) the oversight and profits of a cross ferry or traverse ferry over the Thames, there kept before that any bridge was built. This house of sisters was after by Swithea, a noble lady, converted into a college of priests, who in place of the ferry built a bridge of timber, and from time to time kept the same in good reparations, but lastly the same bridge was built of stone; and then in the year 1106 was this church again founded for canons regular by William Pont de la Arche and William Dauncy, knights, Normans. William Gifford, bishop of Winchester, was a good benefactor also, for he, as some have noted, built the body of that church in the year 1106, the 7th of Henry I.

The canons first entered the said church; then Algodus was the first prior.

King Henry I. by his charter gave them the church of St. Margaret, in Southwarke. King Stephen confirmed the gift of King Henry, and also gave the stone house, which was William Pont de le Arche's by Downegate. This priory was burnt about the year 1207, wherefore the canons did found a hospital near unto their priory, where they celebrated until the priory was repaired; which hospital was after, by consent of Peter de la Roch, bishop of Winchester, removed into the land of Anicius, archdeacon of Surrey, in the year 1228, a place where the water was more plentiful and the air more wholesome, and was dedicated to St. Thomas.

This Peter de Rupibus, or de la Roche, founded a large chapel of St. Mary Magdalen, in the said church of St. Mary Overie; which chapel was after appointed to be the parish church for the inhabitants near adjoining. This church was again newly built in the reign of Richard II. and King Henry IV.

John Gower, Esquire, a famous poet, was then an especial benefactor to that work, and was there buried on the north side of the said church, in the chapel of St. John, where he founded a chantry. He lieth under a tomb of stone, with his image, also of stone, over him; the hair of his head auburn, long to his shoulders, but curling up, and a small forked beard; on his head a chaplet, like a coronet of four roses; and habit of purple, damasked down to his feet; a collar of gold essos about his neck; under his head the likeness of three books, which he compiled.

The roof of the middle west aisle fell down in the year 1469. This priory was surrendered to Henry VIII., the 31st of his reign, the 27th of October, the year of Christ 1539, valued at 624*l.* 6*s.* 6*d.* by the year. About Christmas next following the church of the said priory was purchased of the king by the inhabitants of the borough, Doctor Stephen Gardner, bishop of Winchester, putting to his helping hand; they made thereof a parish church for the parish of St. Mary Magdalen on the south side of the said choir, and of St. Margaret on the Hill, which were made one parish of St. Saviour.

Finally, STOW gives a list of the principal monuments in the church, among them being one of WILLIAM OF WYKEHAM, bishop of Winchester, who was renowned as an architect. They continued to be attractive to people who were indifferent to the state of the building containing them, as is evident from the entry in PEPYS'S "Diary" under the date July 3, 1663:—"With Mr. CREED over the water to Lambeth, but could not see the archbishop's hearse; so over the fields to Southwark, I spent half an hour in St. Mary Overie's Church, where are fine monuments of great antiquity." There could hardly be a stronger testimony to the interest of the memorials than the fact that they were able to captivate so restless a sightseer for thirty minutes.

It must have been soon after PEPYS'S visit that some architect of the seventeenth century (tradition says Sir CHRISTOPHER WREN was the culprit) was commissioned to encase the beautiful altar screen and to mutilate it, in order that the new structure of wood and plaster might have a more even surface to rest against, and to form, as JOHN CARTER said, "one of those vulgar, clumsy altar-pieces in what is called the Grecian taste." The altar screen, of which we give an illustration, resembles the noble work in Winchester Cathedral which was erected by Bishop Fox. It is probable the Southwark screen was also erected at his expense at a later time, for the London palace for the see of Winchester adjoined the priory church, and some of the predecessors of Fox, notably GIFFORD and DE RUPIBUS, were munificent benefactors to St. Mary's. In one feature the Southwark screen is preferable, for in the Winchester screen the figures of the two upper rows of niches stand on the canopies which are over the figures, whilst in St. Mary's the niches are separated by a band or frieze of angels. The entablature of angels and shields is a modern addition designed by ROBERT WALLACE, who had charge of the restoration undertaken about sixty years ago. The figures in the niches were not likely to have survived the surrender of the priory to HENRY VIII., but the canopies and other delicate parts of the screen which were preserved were ruthlessly broken when it was considered necessary to conceal a shrine which once contained images of saints in stone. A partial restoration under WALLACE was carried out at the expense of a special committee. The incised lines seen in the niches were part of the ornamentation introduced above the heads of the statues. It is not difficult to imagine the appearance of the work in its perfect state. There were few churches in England which possessed a reredos presenting so rich a combination of gilded and coloured sculptures.

The restoration of the altar screen was only one among several attempts which were almost simultaneously made to save the church. Centuries of neglect had produced the usual result. The fall of the building seemed to be imminent, and the authorities of the church appear to have been bewildered at the extent of the operations which were required, and at the outlay which was indispensable. JOHN CARTER relates how in 1808 "the seminary youths at Westminster" were accustomed to amuse themselves by mutilating the mullions and tracery of the windows, and the weapons they employed were fragments of the ornamental masonry. There was no beadle or other officer to prevent such havoc. In the interior "compo" was employed as an universal remedy. The greater part of the nave was "hid in the basements by the accustomed pew lumber, and beyond the great arch under the tower the nave is entirely stopped out with that odious, preposterous and useless piece of lumber, the organ case." But no part of the building was in so dangerous a condition as the tower. It was resolved to call in GEORGE GWILT (the elder brother of the encyclopædist), and under his direction the tower and lady chapel, or retro-choir, were restored. It is to be regretted that more was not done by GWILT, but the transepts and screen were undertaken by ROBERT WALLACE,

and what was practically a new nave was created by a Mr. ROSE.

One remarkable circumstance occurred in the course of the works. This was the discovery of a part of the church which had been concealed for more than three centuries. We give an illustration of the part in question, which is at the west end of the nave and south aisle, from a drawing by JOHN BUCKLER, F.S.A. In his description he wrote:—"It was disclosed to view upon the removal of the masonry

The architectural features in these portions of the church are distinguished from the rest by the general design of the capitals and the detail of the sculptured ornaments, both of which present a near resemblance to the forms characteristic of late Norman architecture, and may fairly be assigned to the reign of King JOHN. It was owing to an unaccountable deviation from parallel lines in the position of the newer pillars in the nave that the groined vault in the western portion of the aisles was constructed in the

THE SOUTH AISLE, NAVE OF ST. SAVIOUR'S CHURCH, SOUTHWARK.

by which it had been concealed in the latter part of the fifteenth century, at which period the west doorway and window were inserted. The arches alluded to in a double tier at the west end of the nave, the clustered pillars attached to the same wall, the arches under the windows in the side aisles, the windows themselves in the westernmost compartment of both aisles and the south porch are all of the same age.

irregular manner shown in the drawing. The bases of all the columns were nearly concealed by the pavement. It was observed, upon their being opened, that they had been carefully restored in cement; but the period of this restoration, and of that when the floor was raised, are unknown."

ROSE's nave was completed in 1839, and it was tolerated for a whole half century. Owing to the increase of

interest in the old church and the more general diffusion of knowledge it was at length felt that such Gothic forms as were presented in the nave were unworthy. On October 15, 1889, Bishop THOROLD, in his quadrennial charge to the clergy of the diocese, which was delivered in St. Saviour's, spoke strongly on the subject of restoration :—

All will agree, said his lordship, that the restoration of one of the most exquisite Early English churches in the country, if worth taking in hand at all, should be done thoroughly. Southwark is full of picturesque history, and St. Saviour's is the centre of it. Great functions have been celebrated within the church walls, state processions have passed it on their way to the Metropolis, fire and decay and stupid vandalism have through long ages wrecked their worst on it. Within its shadows repose the ashes of saints, poets, dramatists, who have made England famous. Here in February 1423 James, king of Scotland, was married with magnificent pomp to Joan, daughter of the Earl of Somerset and niece of Cardinal Beaufort, bishop of Winchester. In March 1352 John de Shepy, thirtieth prior of Rochester, was consecrated in this church forty-fifth Bishop of Rochester by the bishop of the diocese, who had a great house close by. The church where Rogers and Hooper and Saunders and Ridley witnessed a good confession before their death of fire; where Gower, Fletcher and Massinger are buried; where Christians still come to visit the tomb of Bishop Andrewes, and where Dr. Sacheverell was chaplain, claims and deserves a united and enthusiastic effort to make her worthy of her past history, and not quite unworthy of a future which must hereafter be in store for her as the cathedral church of London south of the Thames. Of the sordid nave not one stone shall be left standing if I have anything to do with the restoration. The transept and choir are suffering from damp and neglect, and cannot be left as they are without grave risk. Gwilt's admirable instalment of restoration must be now made complete if the fabric is not to suffer irreparable injury and the Church grave discredited.

The restoration was confided to Sir A. W. BLOMFIELD. On July 24, 1890, the first stone of the new nave was laid by the Prince of WALES, and its sordid predecessor will henceforth be comprised in the list of calamities to which the church was subjected. The restored building will be soon reopened by the Prince of WALES, and it merits to be prized, for it is the most interesting example of antiquity which Southwark contains. Of all the buildings enumerated by JOHN STOW it alone has survived.

### ELY CATHEDRAL.—III.

#### *The Octagon.*

THE foundation of the new lady chapel was scarcely laid before, on February 12, 1322, the central tower fell, ruining the adjoining bays all round, and especially those of the Norman presbytery.

Such disasters were not unfrequent. The Norman builders had trusted too much for the strength of their works to mere bulk, and had too much confidence in the rubble with which they filled in the middle of their walls and piers. This was all very well for ordinary positions, and where the cement proved good it was found trustworthy even for the support of concentrated weight; but it was "sailing too near the wind," and, in many instances, where the material was weak or the cement proved unsatisfactory, the piers of their central towers and even other parts of their work gave way. This was the case in the twelfth century with the sister-tower at Winchester (the piers, at least, of the two were the work of the brothers Walkelyn and Simeon); such has been in our own day the case at Chichester, and the same happened in the early days of which we are speaking.

It was not unexpected, for we find that the monks had discontinued the use of the choir, and had their services in St. Catherine's Chapel in the western transept. It was immediately after matins on the eve of St. Erminhilda's festival that the tower fell, with such noise and violence as "to make the whole city to tremble and to cause men to think that an earthquake had taken place."

Happy it was for Ely that she possessed a man, a member of her own convent, who was fully equal to the occasion. The same "venerabilis et artificiosus frater Alanus de Walsingham," who, as sub-prior, had a year before laid the first stone of the lady-chapel, was now at hand, as sacrist, to design and to carry out the great work incident upon this catastrophe.

As the chronicler says:—"The aforesaid sacrist Alan, vehemently grieved and earnestly sorrowful at this disastrous and lamentable event, for a moment knew not which way to turn himself or what to do for the reparation of such a ruin. But, recovering his courage, and greatly confident in the help

of God and of his most pious Mother Mary, and also in the merits of the Holy Virgin Etheldreda, he laid his hand to the work; and first, with great labour and expense, he caused to be removed from within the church the stones and timber which had fallen in the ruin, and also the superabundance of dust which was there, with all possible speed to be cleared away, and having measured out by architectural art, in the place where he was about to construct the new campanile, eight positions in which the eight columns of stone supporting the whole edifice were to be erected, and beneath which the choir with its stalls was afterwards to be constructed, he caused them to be dug out and examined, till he had found a solid place where the foundation of the work could be securely begun. These aforesaid eight places then, having been solicitously proved and with stones and sand firmly consolidated, he then at last began the eight columns and the subsequent stonework, which work, indeed, was completed up to the higher cornice through six years to the year of our Lord 1328."

This simple description records a work of great originality, and standing alone in its design among English Mediaeval structures.

Instead of rebuilding the four great piers of the central tower he wholly removed them, and, stepping backward one bay in every direction, he adopted the eight next pillars as the points of support for his new tower; reconstructing or enlarging them to such size and form as would give suitable supports to a magnificent octagonal central area. He may have been acquainted with the central domes of some Italian churches, such as those at Florence and Siena (the former of which was, however, only half built in his time); anyhow, he struck upon the same noble idea of opening out the intersection of a cruciform church, instead of contracting it by the projecting piers of a tower, and right nobly did he carry out the idea. He did not, however, attempt a dome, which, in a country which had had no experience in their construction, would have been an act of temerity; but, reducing his octagon overhead by timber vaulting to an opening of moderate diameter, he raised on that contracted octagon a beautiful lantern of timber lighted by eight rich windows and crowned again by a second timber vault. The architectural *quasi* construction of this internal design is of necessity distinct from the actual construction, which is effected by a system of vast timbers behind the lower vaulting, by which the weight is conveyed to the eight piers at levels higher than the apparent points of support as seen from within, and above this lantern is a small storey which was used for the bells.

I will not attempt to describe this magnificent design—as you have it before your eyes—further than to say that, the octagon not being equilateral, the four greater sides open into the four arms of the cross by arches commensurate in height with them, while the four smaller sides open by lower arches into the aisles over which, with a small intervening triforium of original design, rise magnificent clerestory windows, opening to the four diagonal quarters of the compass. In the angles at about half height are eight very original and beautiful niches, on the corbels of which are sculptured as many scenes from the life of the foundress, viz. :—

1. Her nuptials with the Northumbrian king;
2. Her taking the veil;
3. Flight from her husband;
4. Her staff budding as she slept;
5. Her induction to the abbacy;
6. Her death and burial;
7. Her translation;
8. A miracle wrought at her canonisation.

The work, though so promptly carried on so far as its stonework was concerned, lingered long in the hands of the carpenters, painters, plumbers and those employed on the fitting-up of the choir, the bell-founders and hangers, the organ-builders, the glass-painters, &c., so that it was not till the forty-eighth year from the commencement of the work than the then sacrist, John of Ely, having mechanically left a place in his annual account for the usual outlay on the "new work," left it unfilled, as having at length no expenditure to record. Strange, however, to say, even the stonework was never fully completed, the eight angle turrets remaining to this day imperfect.

During this long period the accounts of expenses were minutely kept, and contain matters of great interest in the history of Mediaeval building works, the modes of obtaining materials, the terms made use of, and many other matters not possible to be detailed in a comparative sketch like the present.

Walsingham had become prior in 1341, and was elected bishop in 1344, though this election was not confirmed. Thus we find the two greatest English architects whose names are recorded, viz. Alan de Walsingham and William of Wykeham, deemed worthy of the highest rank in the Church.

I have deferred to state that this "new work" was not limited to the octagon. The three ruined bays between it and Northwold's presbytery were rebuilt at the cost of Bishop Hotham, but under the direction of Walsingham. These have

been pronounced to be the most beautiful English works of their period; and unquestionably they stand alone among corresponding works of the fourteenth century, not only in beauty, but in the proportions of their essential parts. The triforium storey had gradually diminished its proportions from the Romanesque period onwards, till we find it in most works of this century (as in the nave of York, the choir of Lichfield, of Selby, of Guisborough and in many other works) reduced to almost a nonentity. Circumstances, however, prevented this waning away at Ely. Northwold, in adding his Early Pointed presbytery, had been held to the horizontal divisions of the Norman work from which it grew; and, in like manner, was Walsingham held to the levels of Northwold's work, so that, whether he would or not, he was compelled, while building these Late Decorated bays, to design them on Norman proportions. This, it must be admitted, gives a grandeur to this work unusual among its contemporaries, though the exquisite beauty of its detail with the advanced but still simple style of its vaulting belong to its gifted architect.\*

The stall-work of Alan de Walsingham, begun in 1338, yet remains, and is of great beauty.

#### *The Lady Chapel.*

Contemporaneously with these great works, however, was proceeding—side by side with them—the construction of the new lady chapel, no doubt designed by the same great architect, though committed to the care of a monk named John of Wisbech, who is recorded to have “continued the work aforesaid with the greatest solicitude through twenty-eight years and thirteen weeks, and to have finished the stone structure with images, both within and without the chapel, in number 147, besides the small images in the tabula or reredos over the altar, and exclusive of the images to the doorway of the entrance to the chapel; also the timber-work covered with lead, and the eastern gable with two windows on either side of the chapel, most beautifully furnished with iron and glass.” He died of the plague in 1349.

The only palpable fault in this building is its undue width. It is a work of wonderful and exquisite beauty, its great glory being the gorgeous and unrivalled series of stone stalls which surround its walls, which are not only worthy of the closest examination, but the more close the scrutiny the more lively will be the admiration excited.

The east window (which is not elegant) and the reredos (which has been very rich, but is much mutilated) are insertions of a somewhat later date; the one given by Bishop Barnet about 1375, and the other being a little later.

I have now brought down the history of the building to another period of truly glorious perfection, and I must decline to chronicle works of deterioration from this condition; indeed, time would fail to tell of the removal of the western spire, the substitution of an octagonal storey which threatened to bring ruin upon it and necessitated costly, and injurious alterations; the changing of the form of the external triforium stage—that of the choir in the fourteenth and that of the nave in the succeeding centuries; the alteration of Northwold's windows and numerous other works of decadence.

It is not easy to imagine the beauty of the cathedral at this period of its perfection. The stern majestic nave, its original design untampered with, the approach to it through the exquisite galilee, and its two unequalled portals, the octagon central space with the gorgeous choir beneath it, and beyond the noble presbytery containing the shrines of the foundress and her relatives, of St. Alban and other saints, glittering with gold and precious stones, while every altar was richly decorated and furnished, every window rich with coloured glass, and the walls and ceilings and pavements harmonised with them by decorative painting, and in all directions the sepulchral monuments of departed bishops, abbots, priors, monks and of pious benefactors, and with no incongruous object to meet the eye at any point.

I will not attempt to go into a description of the sepulchral monuments further than to call attention to the splendid marble effigy of Bishop Northwold, perhaps the finest of its period which remains, and to the gorgeous canopy of Bishop de Luda's tomb, almost a counterpart of that of Edmund Crouchback, Earl of Lancaster, in Westminster Abbey. This has had the central part of the altar tomb cut out to make a passage way, but several of the lost compartments remaining in Bishop West's chapel used to cover the receptacle of the bones of early worthies. The beautiful canopy which, in a mutilated form, had been used for some time to cover the tomb of Bishop Hotham, and which is now restored on the side which had been destroyed, is believed to be the substructure of the shrine of St. Etheldreda, as renewed by Walsingham—and is nearly cotemporary with

that recently discovered and brought back to its place at St. Albans.

The monastic buildings I leave to be explained by my able colleague—only calling attention to the infirmary as a masterpiece of late and refined Norman work, the fragment of the monks' kitchen, also Norman, the beautiful arcading of what was once the refectory, the guests' hall, now the deanery, the remains of the Prior's lodging and its hall, with a beautiful fourteenth-century chimneypiece, and the exquisite chapel of Prior Crawdon attached to it. The latter has been partially but well restored under the direction of Professor Willis and Mr. Stewart, though there is one little blemish I should like to see removed; I mean the stone seat continued behind where the altar stood; a self-evident impossibility for which I was assured by the clerk of the works, the late Mr. Hastie, that no reasonable evidence was found to exist.

*(To be concluded.)*

### THE ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting of the above Association was held on Friday evening last, Mr. Beresford Pite, president, in the chair. The minutes of the last meeting having been read and agreed to, several nominations were announced. The following gentlemen were elected members:—Messrs. P. T. Chew, F. J. Corfield, O. D. Doll, S. A. Heaps, R. H. Whithall, J. A. R. Inglis, G. L. O'Connor, J. Ormrod and W. N. F. Woodland.

Mr. G. H. Fellowes Prynne was duly elected vice-president in place of Mr. J. Begg (resigned), and Mr. Cecil Claud Brewer fills the vacancy on the committee caused by Mr. Prynne's promotion.

It was announced that the following new classes are commencing:—Perspective, Specifications and Estimates, and Elementary Physics.

Mr. A. S. Flower read the subjoined paper (with lantern illustrations) on

#### **An Unwritten Chapter of English Architectural History.**

As the history of English architecture has not yet been written no apology is due to any particular author for venturing to suggest a few unconsidered trifles, for which room might perhaps be found in such a work. But to an audience of architects an apology for introducing a subject of this kind at the present day seems very much needed. One is confronted at the outset with the question, Are not all such studies wholly useless and pernicious? Leaders of opinion confidently assure us that they are; and knowing quite well the disesteem into which historical studies are at present fallen, I hardly dare to occupy your time with matters which so many architects desire to see not merely “relegated” but eternally confined to limbo. It is simply in obedience to the request of the honorary secretaries, binding as a command on every loyal member of the Architectural Association, to provide a paper, which they specified to be “on a historical or scientific subject,” that these notes are offered. I could think of no other subject but my own out-of-date and very unfashionable hobby of English Gothic architecture; but as shirking the duty, or, as I think I ought to say, declining the honour seemed out of the question, I took encouragement from a passage in the President's opening address, when he bade us, “study the mind in the building, through painstaking measurement and logical reasoning. Find out how and why every joint and form was made. The answer lies hidden in the building.” This is just what for a long time I have been trying to do, and I am therefore at least acting on our President's advice in bringing before you the results of some independent research into the history and characteristics of the Mediæval architecture of England.

Waiving then for the present the great question as to whether any such studies are to be recommended at all, and assuming, merely as a premise (let us say nothing of examinations), that a young architect wishes, for some reason or other, to learn something of the old architecture of his country, how can we best assist him? I should first like to quote some old advice given on this subject, which no one here can ever have seen in print. The extracts are lengthy but have a bearing on what is to follow.

If you ask how you are to study architecture, you will probably be told to read up the whole history of the art in all countries, with formidable lists of names, dates and dimensions. You will have recommended to you treatises on the orders and styles, on rules of proportion and other arithmetical niceties; and will be further advised to read books on the principles of beauty and taste, and probably much poetical extravagance in addition. . . . However we may define architecture, we must agree that it is a practical art, confined by the requirements of utility, the properties of materials and the laws of mechanics. Therefore in studying it be practical; put aside all considerations derived from archaeology, sentiment or association, and simply use your own eyes and your own common sense; learn by

\* It will be observed that a large shaft separates Bishop Hotham's three bays from the work of Bishop Northwold. This is the pier of Abbot Simeon's apse. It remained attached to his four presbytery bays after Northwold had added his six bays to it; and when Hotham rebuilt Simeon's presbytery, he left this little relic of it between his own work and that of Northwold.

observation and by reasoning. Ask the buildings themselves why they are as they are, and what is their meaning. Imagine yourself with the builders, asking what they are going to do, and wherefore. . . . So when you criticise, you will neither praise a building because it is correct or classical, or reminds you of something which you have admired elsewhere; nor will you condemn it because it appears new and strange, or, on the other hand, familiar and unoriginal; you will simply consider, is it good in itself, that is, is it well fitted for its purpose and well adapted to its position, are its materials well chosen and well put together, is it expressive of its object and its construction, does its design show everywhere a striving after beauty? If all this is the case, it is good architecture; but if one of these qualities be lacking, though the building may display the most costly and splendid materials, the highest mechanical skill, the most careful workmanship, the most accurate copying of some acknowledged masterpiece, the result, as architecture, is bad. . . . To criticise buildings, you must try to grasp the circumstances of their erection, and look at them from the point of view of a constructor. The disposition must be encouraged of thinking of a building as a thing composed of stone, brick, timber and iron, erected for a definite purpose and under particular conditions, and not, with the architectural writers of the last three centuries, as merely an affair of lines and conventional proportions and ornaments, quite independent of materials, use or position, just as if it existed only on paper; nor, with some of our own day, as a thing whose essence is accidental picturesqueness, historic or romantic associations, or the superficial decoration of sculpture, painting or heraldry.

This almost anticipates the new philosophy of architectural materialism, and, as we hear so much nowadays against even the use, and not only the abuse, of books in connection with architecture, I quote these passages from an unpublished paper which I read to an amateur society many years ago. The present subject obliges me to make many references to books, so I wish just to clear the ground, and put myself in order, so to speak, by explaining that, having gone through the phase myself, I quite appreciate the standpoint, and can thoroughly enter into the feelings of certain good friends of mine, fellow members of the Architectural Association, who not only object to any form of book-learning, but even declare, as one quite lately did, that all architectural books ought to be burnt. There is truth, of course, in the idea underlying this—all the books in the world will not make one architect; but the easy proof of this proposition does not negative nor even weaken another one, namely, that books may be useful to architects.

Returning to our imaginary student we tell him, of course, to go out sketching and measuring, and not to neglect to take notes of construction and materials; every one will agree in this advice. He then surmounts, let us suppose, every technical difficulty, until we find him able to draw with the utmost accuracy and most thoroughly artistic touch any subject he may meet with; he has seen and sketched hundreds of buildings and acquired quite a respectable acreage of details; he can freely reproduce from memory any portion of his sketch-book; he is, in short, a consummate draughtsman, but there is still something wanting. I am not speaking now of the faculty for design, but simply of that knowledge of the architecture of the past which we are presuming that he desires. Does he really understand these buildings? For all that he has done so far he may be no more capable of seeing into the ideas and motives of the men who built them than the most prosaic and mercenary photographer. The difference between the two is not necessarily more than one of manual process, the mental attitude of each may be substantially the same. Unaided observation, accompanied by however great technical skill in recording, will not enable a man to read the riddles of ancient buildings. Whenever curiosity begins to be aroused as to how, or when, or why some particular work was built; whenever, in short, the student wishes to go a stage further and to know all about what he is sketching, he comes to feel the need of definite guidance; in fact, he has recourse to books. He requires them for several reasons: to learn methods of arranging, connecting and utilising his own disjointed memoranda; to obtain many indispensable facts which he could not possibly discover for himself; to bridge over gaps in his own experience, to become acquainted with principles and theories which may throw light on what he has observed or direct him into fresh fields of inquiry.

Books on the history of architecture are not, as is frequently asserted, fetters forged by malign opponents for the enthralment of art, nor are they simply labour-saving tools to assist lazy men in the mechanical business which they call their art. Rightly used, they are the means by which an architect may learn the true nature of his art, its difficulties, its qualities and powers, its grand possibilities. But architectural books lead us at once to the thorny question of styles. "Read a little history," the student is sometimes told, "but steer clear of anything to do with divisions of styles." All art is one; therefore all Gothic architecture is one, and it is criminal wickedness to attempt to divide it." Advice of this sort in many cases cannot possibly be attributed to any dislike or contempt for the kind of architecture in question. It is principally based, I believe, on a misconception, which it seems worth while trying to explain.

In most branches of knowledge, if not in all others, it is

generally agreed that subdivision and definition are requisite in order to render learning and teaching possible. "The orderly arrangement," I have seen it expressed, "and classification of its material is necessary to the true advance of knowledge." Of course, if it has to be conceded that Gothic architecture is a thing by itself, not subject to the common rules of human experience, the argument that methods like those found necessary in other arts and sciences can be successfully applied to it falls to the ground at once. But this those who talk about a one and indivisible style have still to prove. In the meantime I prefer to believe in the sound old Roman maxim, "Divide et imperia," which may be freely rendered, "By division you will become master."

If we suggest, then, that for the sake of a more intimate acquaintance with the character of Gothic building, the learner should analyse it, should consider its component parts separately and in their relations to one another, instead of only gazing on it as a whole, beautiful but incomprehensible, we must consider the means at his disposal to enable him to grasp his subject. Directions, guide-posts and landmarks innumerable await him; but unfortunately the greater number of them, and of these the most conspicuous and most generally followed, have been set up on the wrong roads. This is, I believe, the real cause of the distrust now so strongly manifested in all definite study of Gothic. Many men have a vague sense that there is something inadequate, something unsatisfactory, in the orthodox teaching on the subject, and jump to the conclusion that therefore all teaching of it must be wrong and misleading. The idea of improving our present methods does not seem to anyone worth a thought. As it is of no material disadvantage nowadays to an architect to know nothing about Gothic, the older men either leave it alone, or go on, content with the notions about it remembered from their boyhood, thinking the whole subject so simple, so easily mastered, that everything which could possibly be known about it was long ago finally settled and laid out, cut-and-dried, leaving no room for further research or progress. But this attitude has had results for the younger generation. There are still men, even amongst the youngest of us, who take an interest in our inheritance from the middle ages, and there is besides a much larger and rapidly growing body outside who do the same and who look to us for instruction and guidance. To these architectural students, craftsmen and amateurs we have nothing to offer but a confused, incomplete and largely untrue account of our ancient architecture. Shoals of books, indeed, there are, but all of them, down to the very latest, are but echoes of the imperfect description of Gothic architecture composed and, to a great extent, invented by the antiquarian *dilettanti* of a hundred years ago. Perfectly true and correct echoes of the old voices they may be, as to that there need be no dispute; but the very important consideration, that in so many ways we have now the means of knowing more than even the cleverest of our great grandfathers could possibly attain to, has, in the general treatment of this subject, been most strangely and sadly overlooked. No wonder is it, then, that an intelligent student, turning to the recognised authorities, and finding himself in a maze of unreal and contradictory statements, often quite at variance with the evident testimony of the buildings as well as with the authentic records of history, becomes utterly disgusted and is tempted to say, "These things have nothing to do with architecture." Illustrations, of course, have been immensely improved, many new facts and descriptions have been added; but as to all matters of generalisation of principles and of application to practice, we are still using a system which is demonstrably absurd and which deserves to be obsolete.

I speak from a considerable experience of the actual difficulties found in pursuing this subject, which evidently oppress even zealous and hard-working students, and these remarks are entirely prompted by the desire to do something if possible towards smoothing the path to a reasonable understanding of it. We have stayed marking time, while in every other branch of knowledge a great advance has taken place, and it is quite time that we should bring ourselves up into line. But the remedy is not to be found in general abuse of antiquaries. Their pioneer work has been of indispensable importance. The fault lies in our having yielded up to them the duty of commanding and directing, which we ought to have exercised ourselves. Hence so many of the generally received ideas about Gothic architecture come from laymen, not from architects, with the natural result that they are thoroughly amateurish and completely ignore the one thing which we care most about—design. We have forgotten that the proper function of our antiquarian comrades is merely to heave the lead and accurately report the soundings for our information and guidance, and not in any circumstances to set the course or steer the ship. To descend from metaphor to details the lay mind—even in the case of the best educated and the cleverest men—seems incapable of thinking of architecture except only as a species of superficial adornment applied in an ascending scale of ostentation. Every imaginable question in architectural design is reduced by the average

Englishman to the single, and to him all-sufficient, one of comparative richness or plainness. Thus we hear members of Parliament and other typical exponents of public opinion treating all buildings as necessarily falling under one or other of three heads; they must belong, that is to say, to what they term the "plain" or "cheap" style, to the "ornamental" or "expensive" style, or else to the intermediate one generally known as the "handsome" style. Imbued with such ideas our lay antiquaries, when, unfortunately not content with collecting and verifying facts, they took to formulating systems, naturally classified and described all our ancient architecture according to the increasing quantity of ornament, which they supposed they could recognise in successive periods.

They were practically unanimous in their division of all Gothic work into early or plain, intermediate or more ornamented, and late or profusely ornamented. There was a vast amount of discussion as to the precise terms to be used to express these distinctions, and as to the particular dates at which one should be held to have merged into another, and almost by accident the designation of the latest style, which very nearly settled down into "Flourish," has come down to us as the much more architectural "Perpendicular;" but the method all round was the same; not to study the differences of design in the buildings, and trace thence the divers principles which had governed their builders, not to study the social history of the nation and learn thence the various events which had influenced its modes of building, but to start with a hard and fast, ready-made schedule of three heads, and cut, cram, maim and squeeze so as somehow to get it filled in. It was reserved, however, for a later generation, almost our own contemporaries, to carry this tripartite system to absolutely symmetrical perfection, by overriding clear historical facts, and declaring the existence of three separate styles, each exactly contemporaneous with one century of the Gothic age. Complaints of this kind may perhaps be called unreasonable or hypercritical. The books in common use, one may be told, give us quite as near an approximation to truth as we need either expect or desire.

To try, therefore, how far this easy confidence is really justified, I must ask you to consider, as briefly as possible, just one instance of irreconcilable difference between views generally accepted and plain facts of history. To quote from a very well-known manual:—"The change from one style to another was not immediate; it generally took nearly half a century to effect the transition, and the last half of each of the five centuries was such a period of change or transition. Buildings of the last ten years of a century generally belong in style rather to that which follows." Passing on to particulars our authority further tells us:—"In the fourteenth century the general character is of the style called Decorated; the last half of it is the period of transition from the Decorated to the Perpendicular." Nothing could be more beautifully simple and regular; but nevertheless it used to be a great puzzle to me how, if all this were true, one never met with a "Decorated" building after the middle of the century, while, without any premonitory signs of change, everything after that time was to be found designed on entirely different, indeed almost opposite, principles. No reaction in taste could by itself account for such a startling change, and from no architectural writer nor any general historian could an explanation of the mystery be obtained; indeed, none of them seemed to recognise the fact. Only after a good deal of search in the bypaths of history did I come across the clue, namely, that the "Decorated" style, after an existence of only some five-and-thirty years, was suddenly cut short and literally killed by the Black Death, that awful pestilence which went near to depopulating England in the years 1348-49.

Epidemics are disagreeable and unpicturesque subjects, apt to be avoided or lightly passed over by even the best historians, as this particular one has been until quite within the last few years. The Black Death, though it ravaged every corner of Britain, carrying off in a few months more than half the population—destruction compared with which even the Great Plague of 1665 sinks into insignificance—did not strikingly affect the general course of politics; on the surface the current of affairs appears to flow on unchanged, but in the artistic just as much as in the social history of England it forms a turning-point of immense importance. All the conditions under which building was carried on were suddenly, violently and permanently altered.

Time will not allow, nor perhaps would you care to hear, even a brief description of the effects of this visitation; but I believe that anyone who will take the trouble to study the inner history of these few years will have no difficulty in learning both how it came about that the "Decorated" style never ran its natural course of logical development, and also what were the causes of the special characteristics of its successor.

The chapter of the history of English Gothic architecture which has never yet been written is the one which shall treat of the whole matter on the sole basis of design. No one except an architect can write this chapter, but only one, so far as I can discover, has ever fairly essayed it—I refer, of course, to the late Edmund Sharpe. His description of Gothic building is

the most architectural one which we possess, and is full of valuable suggestions; but hardly anyone regards it as more than a partial success, and it has certainly not succeeded in supplanting, as its author hoped, the popular amateur version. Sharpe made a bold and original endeavour to place the study of Gothic on better foundations, but his work was doomed to failure, because it rested only on one particular section of design, and that not in reality the most important. In seeking a key to the understanding of Gothic architecture in window-tracery alone, and grouping all buildings in accordance with that one standard, Sharpe showed that after all he was, however unconsciously, still under the influence of the amateur school, who saw in tracery, as they do to this day, the principal evidence of that comparative amount of decoration which they denominate "style." But if I rush in where Sharpe failed, if he feared not, to tread I shall be in danger of the apt quotation of an ancient proverb. If anyone is expecting me to say that I have got the missing chapter in my pocket, I fear he must be disappointed. But over there, in the lantern which our kind friend Mr. Wonnacott will shortly bring into action, I have collected some material which may perhaps suggest to some one how it might be written, and will, at any rate, lighten the dulness of this sermon.

This first slide is one which I have just had made from a MS. in the British Museum, and I do not know that the subject has ever been exhibited before. It is taken from Matthew Paris's "Life of King Offa" (Cottonian MS., Nero D i). The author and illustrator of this work was, I may perhaps remind you, a Benedictine monk of St. Albans Abbey, who died a few years before King Henry III., and is said to have been equally distinguished as theologian, historian, artist, poet and mathematician. The original is an outline drawing in brown ink, measuring about 9 inches by 5 inches, so that the large figures are about 4 inches high. The subject is Offa, king of Mercia, directing the building of St. Albans Abbey, and it is hardly necessary to say the drawing illustrates a building scene of the days of its author, and not of the remote period which he is describing. Its main interest lies in the fact that we have here an unquestionable contemporary representation of a Mediaeval architect, together with some important evidence as to his position and methods of work. It is worth while taking note of even the details of this drawing, because some of the most fashionable modern theories about Gothic architecture depend entirely upon the supposed non-existence of architects in the Middle Ages. It has quite recently been confidently stated, though apparently upon no better grounds than an *à priori* assumption, that "there never was no such person," or that if there was, he was quite undistinguishable in any way from an ordinary mason. We have been told that he could never, like a degenerate modern architect, have been seen upon the works with his coat on, because he could not have possessed one, nor even in his shirt-sleeves for a similar reason. Now the man before us, to consider his outward aspect first, is not of this sort. In all particulars of dress and general fashion he bears a close resemblance to the king and his attendant. So far, too, from looking just the same as any one of the crowd of workmen whom we see engaged in their various handicrafts, he is unmistakably a man of learning and culture, whose work lies in designing and directing rather than in simple manual labour. He is discussing on very friendly terms some point concerning the building with the king; the latter apparently has made some suggestion, but the architect is giving his opinion with no undue show of deference, while the courtier keeps in the background till the question is settled. Even were there no other signs to guide us, this drawing is enough by itself to suggest that a great Gothic building was not, as is so often pretended, a mere concretion of material, piled up by the unorganised and undirected labour of many similar units—exactly in the manner of a coral reef—but was, on the contrary, the actual creation of a single intellect as truly and absolutely so as a play of Shakespeare or an oratorio of Mendelssohn. There is not in reality the slightest disparagement of the other workers who took part in raising such a building in saying that their work could not have come into being without an original mind to give the necessary impulse and control; it is no more than saying that the cleverest actors and the most skilful musicians depend after all for the opportunity of exercising their powers on the previous labour of the individual dramatist and composer. When we know that Matthew Paris not only witnessed important building operations in his own abbey, but was in great favour with Henry III., and present at his court during the erection of the Abbey Church of Westminster, we may readily imagine that in representing the legendary scene of Offa's foundation of St. Albans, Paris drew upon his recollections of the frequent interviews he must have witnessed between Henry and the architect of the great church in the building of which the king took such deep and constant interest. But notice also this architect's compasses and square—they denote more than that he is merely an expert in building—they mark the geometrician. This is a point we must return to, after looking at the other slides, views and details of build-

ings selected for special reasons, which, for convenience sake, must be shown now.

The views on the slides then exhibited comprised Whitby, Fountains, Rievaulx, Lincoln and Beverley, illustrating the first group. The second group was represented by the shrine of St. Alban at St. Albans (a piece of legitimate restoration); gate of St. Augustine at Canterbury; chapel of Merton College, Oxford; the eastern window of Tintern, and Lichfield. The third group included the abbey gateway, Bury St. Edmunds; the screen at Winchester, Selby, Beverley, the east window of Carlisle Cathedral, and window from the church of Holy Trinity, Hull. All these were executed prior to the fear of the Black Death. Examples of work after 1349 were taken from the extreme east end of York, said to be about 1560; Winchester, the later part of Merton, Manchester Cathedral, St. Cross, near Winchester; the west front of Norwich; Canterbury; the west end of Holy Trinity, Hull; St. Mary's, Beverley; and the Beauchamp Chapel, at Warwick.

To come back now to Matthew Paris's drawing. Here we may find the clue, without which we can never learn to see the mind of the Mediæval architect in his work. He was essentially a geometrician. In the great intellectual movement of the thirteenth century, no branch of learning, except theology, was more widely cultivated than geometry; and this science, both then and for long afterwards, occupied an altogether higher position relatively to other intellectual pursuits than it does at the present time. Among the many side-lights which the recognition of this fact seems to throw upon the development of English architecture is one with regard to the vexed question of influence from the East. Most people have at some time felt, if they have not, through lack of tangible proofs, actually allowed, that Oriental suggestions must have played some part in the formation of English Gothic architecture. As an explanation of this, it has generally been loosely asserted that the English Crusaders tried to reproduce at home the Saracenic architecture which they had seen and admired in the course of their campaigns; a supposition which, besides being unsupported by a single evidence, must seem to anyone acquainted with the average military mind absolutely incredible. But when we think of the highly prized Arabic geometrical treatises then finding their way into every monastery and university (the latter being at the time thronged by lay scholars, in numbers almost impossible to realise), there is little difficulty in imagining how the subtle influence of books, written by men whom the most learned of Europeans revered as their intellectual masters, became the means by which Oriental inspirations were grafted upon the rising tree of English architecture. Until we can form some idea of the influence of geometry during the Middle Ages, nowhere stronger I believe than in our own country; until we can partly realise the fascination in the study and exercise of it which then possessed every educated mind, lay and clerical alike, we shall never be able to understand the conditions under which our Gothic structures were designed. Geometry is the indispensable key to the thoughts of the men who built them; indeed, I will go so far as to say that, were I asked to define English Gothic architecture in the fewest possible words my definition would be:—"A species of building wherein every part, from the greatest to the least, is dominated by the same geometrical motive." I beg you to notice, however, that I do not say, simply, "dominated by geometrical motives," nor "by a motive," but "by the same motive." A great deal turns upon this. It will not be at all surprising to hear this definition objected to as being nether new nor true. It may be contended, on the one hand, that everything possible to be said about the connection of geometry with Gothic architecture has been already said; and, on the other, that true art soars far above the trammels of such a cold, hard, prosaic science. Both objections cannot be dealt with together. The former, of course the less important, may perhaps be sufficiently answered in a few words; but, to establish a case to meet the latter, which I expect would be fervently urged, would require the production of a large body of pictorial and other similar evidence, such as, unfortunately, I am unable to bring before you in the limits of the present paper.

But there may still be time to say a little about previous references to the relation of geometry to Gothic design. The mention of it at once calls up visions of plans and sections of churches, crossed over like maps by squares and triangles, with arguments on the supposed rules of their setting out, which have rarely succeeded in carrying conviction, chiefly on account of the apparently arbitrary and usually contradictory systems of measurement adopted by rival theorists. It suggests also that much ingenuity has been devoted to one particular class of geometric design by the illustration of the infinite variety of patterns producible from contained and intersecting circles. Nor will it be forgotten that some authorities have gone so far as to speak of a "geometrical period," though only as a short-lived minor division of English Gothic. We may be grateful for hints from all these sources, but they neither exhaust the subject nor give us the information for which we

seek. It should be remembered that, owing to the general destruction of our own ancient libraries, and the consequent dearth of direct home evidence, people have been implicitly relying upon certain works on proportion, which happen to have come down to us from German and Italian architects of the latter part of the fifteenth and of the sixteenth centuries, to explain the principles of English architecture in the thirteenth and fourteenth centuries. To arrive at an understanding of the actual manner in which Old English architecture was influenced by geometry, not for a limited time only, but from its birth to its decline; not through any one form or figure only, but through many; not vaguely and at random, but with a single order of forms dominating, as a keynote, each particular era in succession, and quickening inert matter by the inspiration of an intellectual force, we must discard many old methods, old prejudices, old associations. We must look for new facts in our own buildings, and for new light upon them from increasing knowledge of our own social history. We must establish our principles solely upon the firm base of observations, instead of stubbornly dogmatising in the old, vicious manner, and mangling facts to make them square with unwarrantable theories. In doing this we may gain even more than truer and fuller knowledge of the past, we may find sure helps and great encouragement for the future.

Mr. Paul Waterhouse said it would be difficult to append a discussion to such a paper, as it was the work of a specialist. When the student first studied Gothic architecture it was like looking at chaos. The divisions could never of themselves have served their purpose, and it was these very divisions which made the subject so complex and helped to obscure it. He proposed a vote of thanks to Mr. Flower, which was seconded by Mr. Seth-Smith.

Mr. B. F. Fletcher entirely disagreed with the notion that the military men could not understand architecture. The Crusaders were intellectual men and the most likely people to understand it.

Mr. Flower having replied, it was announced the next meeting would be held on February 19, when Mr. W. H. Bidlake will lecture on "The Architect and the Public."

## TESSERÆ.

### Henry III. and Sanitation.

IT was during Henry III.'s reign that perhaps the first attempt at underground drainage was made. The refuse and dirty water from the royal kitchens had long been carried through the great hall at Westminster, until, according to the language of the king's writ, the foul odours arising therefrom seriously affected the health of persons congregating at court; to remedy this evil a subterranean conduit was devised, which conveyed these offensive matters into the Thames. Indeed, if a complete collection were made of all the sanitary regulations and provisions issued in the times of Henry and Edward I., it would be found that we have not made any great advance on the notions then prevalent respecting public nuisances. It was in the thirteenth century that a conduit of water was first established in London; the earliest was probably made by the monks of Westminster, and the precincts of the abbey are to this day supplied from the original sources. The next was constructed by the citizens of London. Henry had water conveyed underground to his palace at Westminster, especially to his lavatory; his conduit may have communicated with that of the monks. The king granted as an especial favour to Edward FitzOtho, architect of the abbey, who had lodgings at the palace at Westminster, that he might have a pipe, of the size of a quill, to convey water from the royal conduit to his own quarters. Before and after the establishment of a conduit, water was hawked about the streets of London, as it recently was in suburban districts, by "water carriers" (*aque portarii*), who appear to have formed a considerable body in the twelfth century; the names frequently occur as witnesses of deeds in the thirteenth. The ordinary resources of the citizens, when distant from the river, were wells. The few coroners' rolls of this date remaining in the possession of the Corporation of London show that many fatal accidents happened in attempting to cleanse wells.

### Origin of Tontines.

In the year 1644, a Neapolitan, named Lorenzo Tonti, came to Paris, and, during a scarcity of money which then prevailed, proposed the formation of a kind of life rents or annuities, which subsequently were designated, after him, Tontines, although the principle itself was in operation in Italy before his time. The tontines so proposed differed from the afterwards ordinary popular lotteries in the contingency of the increasing and maximum advantage being deferred for many years, with the assurance only of a moderate profit beforehand, beginning at a definite rate. After tedious disputes, in regard to his original proposal, which was at length rejected for a time, he substituted in its stead a new plan for a large *blanque* or lottery,

which, in 1656, obtained the royal approbation. It was to consist of 50,000 tickets, each at two louis d'ors, so that the whole receipts would amount to 1,000,000 livres (the louis d'or at that time being only eleven livres); from this sum 540,000 livres were to be deducted for building a stone bridge and an aqueduct. The expenses of the blankie were estimated at 60,000 livres, and the remaining 500,000 livres were to be divided into prizes, the highest of which was 30,000 livres. This lottery was never carried out. After some delays, by which the matter was retarded until after the peace in 1660, a lottery was finally opened, and the tickets, at a cost of one louis d'or, were drawn publicly under the inspection of the police. The highest prize was 100,000 livres, and was won by King Louis XVI. himself, who objected to receive it, and left it to the next lottery, in which he had no ticket. Several other lotteries followed, to such an extent that in the year 1661 it was ordered that all private lotteries should be forbidden under severe penalties, and this prohibition was repeated in 1670, 1681, 1687 and 1700. Since that time no other pure money lotteries have been allowed, but the "Loterie Royales," the profits of which were, in general, nominally applied to public buildings, as was the case in regard to the magnificent church of St. Sulpice in Paris. The first actual tontine upon lives was created in the month of December 1689, and was practically an annuity association. It was divided into fourteen classes of an annual revenue, in all, of 1,400,000 livres. The shares were 300 livres a piece, and the proprietors, without regard to sex, were to receive a yearly dividend, commencing at 10 per cent., with benefit of survivorship by way of increased income in each class. The first class contained children under five years of age; the second was composed of others between five and ten; the third from ten to fifteen, and so on for the other classes. This tontine was very imperfectly filled up; for into the first class there entered only 202 members, and equally few persons into the others; yet many other French tontines were formed subsequently, in 1696, 1709, 1733, 1744. In the year 1726 the French king united the thirteenth class of the first tontine with the fourteenth of the second, all the shares of which were possessed by one person, Charlotte Bonnemay, the widow of Louis Barbier, a surgeon of Paris, who died at the age of ninety-six; this lady had ventured a stake of 300 livres in each tontine, and in the last year of her life she had for her annuity 73,500 livres, or nearly 3,600*l.* a year for about 30*l.* The last state tontine in France was in 1759; after which an impression arose, very justly, that as the lives did not die off so speedily as was expected, the rate of annuity allowed, in redemption of the capital subscribed, with interest thereon, was very onerous; hence, in 1763, the Council of State decided that this sort of financial resource for the creation of capital for governmental purposes should not again be resorted to.

#### Scene Painting.

It is evident that the stage, in the time of Shakespeare, had no scenes, or at most perhaps but one, and that standing for all, for Sir Philip Sydney says, speaking of tragedies and comedies, as exhibited at the public theatres:—"Now you shall have three ladies walk to gather flowers, and then we must believe the stage to be a garden. By-and-by we hear news of shipwreck in the same place, then we are to blame if we accept it not for a rock. Upon the back of that comes out a hideous monster with fire and smoke, and then the miserable beholders are bound to take it for a cave." There seems to have been almost as great a scarcity of supernumerary actors; for, he adds, "while in the meantime two armies flie in, represented with four swords and bucklers, and then what hard heart will not receive it for a pitched field?" The Scotch used painted scenes, for the royal stage at least, before they appeared in theatrical representations in London; for some dramatic pieces, performed at Holyrood House by order of James I. before his accession to the throne of England were enlivened by scenes upon the stage, designed by Mytens and painted by some foreign artist. In the dialogue between Lovewit and Truman, the latter says, "What if there were five theatres then (before the civil wars), the town could maintain them, the prices being small, there being no scenes." He proceeds, "It is an argument of the worth of the plays and actors of the last age, and easily inferred that they were much beyond ours in this, to consider that they could support themselves merely from their own merit, the weight of the matter and goodness of the action, without scenes and machines; whereas the plays, with all that show, can hardly draw an audience, unless there be the additional invitation of a Signior Fideli, a Monsieur l'Abbé, or some such foreign legate expressed in the bottom of the bill." The introduction of stage scenery in England is to be ascribed to King Charles I. when he and Queen Henrietta, the handsomest royal couple then in Europe, played in the masques at the palace of Whitehall. The first scene painter was the renowned architect Inigo Jones, who was also machinist for this stage. This great man had studied as a landscape-painter in Italy. We may reasonably suppose, then, that with his knowledge of the picturesque, united to his elegant taste for Grecian architecture, and painting for such a connoisseur as his royal patron,

that the scenery and machinery must have been delectable to behold. Ben Jonson wrote the masques, and the music was composed by Lanieri. The beautiful masque of Comus, written by Milton, was exhibited with all the decorations that could be given by painted scenes, dresses and machinery, to render the spectacle as illusive as art could make it. Henry Lawes, composed the music for this masque, and played the character of Thirsis, the shepherd. The children of the Earl of Bridgewater also performed in the piece, as it was represented before his lordship and his friends, the neighbouring nobility and gentry, at his seat, Ludlow Castle, on Michaelmas night, 1634. The improvements which were designed for the public theatres under the auspices of the king were suspended at the commencement of the troubles which drove Charles to take the field; and the subsequent Government of the Commonwealth, holding play-houses and players in abhorrence, as schools of Satan and scholars of perdition, shut up the theatres, and suppressed the drama altogether.

SIR,—As a subscriber to your valuable paper for some twenty years, I am sure you will pardon my taking up my pen to plead the cause of your illustrations of "The Cathedral Series." They are so very superior to anything that has yet been brought out, that I am sure you will find it well repay you to print them separately, and not in the text, as at present. I purchased two copies extra last week, from January 1, to send to some friends abroad, but you can, I am sure, understand how very disappointed I was at those which appeared in the letterpress. Do, for the sake of lovers of our grand old cathedrals, seriously consider the appeal made to you by Mr. Johnson, and yours truly,  
AN OLD ADMIRER.

Birmingham: February 9, 1897.

#### GENERAL.

**Mr. W. J. Evelyn, J.P.**, of Wotton, Surrey, has appointed Mr. Reginald St. A. Roumieu (Roumieu & Aitchison) as surveyor to his Deptford and Rathbone Place, W., estates.

**An Architectural Draughtsmen's Society** has been founded in New York with the title of "The Acropolis Club." Mr. T. Eagleson was elected as first president.

**M. Ulmann**, architect, who was one of the assistants of the late M. Alphand and who is largely engaged in Paris, has been made a Chevalier of the Legion of Honour.

**The Skinners' Company** have granted 100 guineas towards the building fund of the Working Men's College, Great Ormond Street.

**The Walsall Town Council** have decided to purchase from Alderman Holden a freehold site for the erection of municipal buildings. The ground will cost 6,000*l.*, and lies between the public baths and the county court.

**M. A. Dubois**, the medallist, has been commissioned to execute a medal at a cost of 6,000 francs to commemorate the opening of the mairie in the tenth arrondissement of Paris.

**An International Exhibition** of Fine Arts, under the patronage of the Prince Regent of Bavaria, will be held at Munich from the beginning of June till the end of October. Foreign artists may send their works and compete for the prizes.

**M. Maurice Guillemot** will exhibit in the Salon this year his monument of Alexandre Dumas fils. The writer is represented, at his own desire, lying on a couch in his ordinary working costume, with bare feet. His hands are joined, and a crown of laurels is on the head.

**The Central Society** of Belgian Architecture announces that an international congress of architects will be held at Brussels, under Government auspices, during the Currency Exhibition, to celebrate the twenty-fifth anniversary of the Society's foundation. It is anticipated that the leading countries of Europe, as well as the United States, will send delegates.

**Mr. Frank Matcham** has been appointed architect for the new theatre which is to be erected in Dublin on the site of Leinster Hall. The building is expected to be completed by August.

**Dr. Rowand Anderson** and Sir J. E. Poynter, P.R.A., have been elected honorary members of the Royal Scottish Academy.

**A Paper** on "Architectural Epidemics" will be read by Mr. H. Barnes at the meeting of the Northern Architectural Association on Wednesday next.

**Mr. Henry Kerr** will read a paper on Elgin Cathedral at the meeting of the Edinburgh Archaeological Association on Wednesday. The building is a notable example of the abandonment of the triforium in Scottish architecture.

# The Architect.

## THE WEEK.

A PREMIUM of 10*l.* offered for the best design for a poster to advertise the Building Trades Exhibition in March attracted the attention of about thirty competitors. After careful consideration, the premium has been awarded to the design marked "Simoun," which was sent in by Mr. J. HOURV, 9 Hatherley Road, Bristol. The following competitors were highly commended:—"The Master Builder," Mr. MUIRHEAD BONE, 7 Jane Street, Blythwood Square, Glasgow; "Sphinx," Mr. ALFRED MORGAN, 89 Albert Road, Battersea Park, S.W.; "Bis," Mr. ROBERT F. SHERAR, 13 Maxwell Street, Edinburgh; "L'Elephant Blanc," Mr. DAVID PEARE, 167 St. Vincent Street, Glasgow.

IT is ordered by the Factory and Workshops Acts that all interior wall-surfaces and ceilings, whether plastered or not, and all stairs and passages, shall be either lime-washed once at least within every fourteen months or painted in oils or varnished once at least within seven years. A case was heard a few days ago at Hyde, in Cheshire, which suggests that what "lime-washing" signifies is not clear to all factory owners. A firm of cotton spinners were summoned by the local inspector of factories for non-compliance with an order to lime-wash the ceilings of the rooms. The defendants stated, they had applied limewater to the ceilings, which was all the Act required. At the hearing it was contended on their behalf, and also for the masters' federation, that limewater was sufficient for cleanliness and sanitary purposes, and therefore complied with the Act of Parliament. Lime applied in the old-fashioned style dropped on the machinery and was injurious. The Mayor said the bench had come to the conclusion that a breach of the Factory Acts had been committed. A nominal fine of 5*s.* was imposed, with costs. The decision is important. The Legislature believed in the virtues of lime when applied of adequate thickness. As to the falling of lime, that indicates vibration of the surface to which it is applied, for without an unnecessary quantity of size whitewash can be made of sufficient endurance.

EVERYONE who is eager for the enrichment of the national collections must be in suspense until the will of the late Lady WALLACE is read and it is ascertained what will be the fate of the invaluable collections which were in Hertford House. They were mainly purchased by the late Lord HERTFORD in Paris. The late Sir RICHARD WALLACE was desirous that they should become national property, and he allowed many of the pictures and other works of art to be exhibited at South Kensington and Bethnal Green. All who saw the treasures must have felt it would be an advantage if they could be possessed by the public. But the authorities could not agree to the proposal to have them preserved in the house in Manchester Square, although the collections are never likely to appear to so much advantage in any other building. It is difficult to say in what department the HERTFORD-WALLACE treasures are richest. Many judges consider the small paintings by MEISSONIER are unrivalled. There are works by DECAMPS, DELACROIX, COROT and others of the advanced French school, which are no less characteristic than those by MEISSONIER. The Louvre possesses only one picture that is worthy of WATTEAU, and, in spite of the strain on French finance, an enormous sum would gladly be paid to acquire the examples which are now in Hertford House. The Italian, Spanish and Flemish schools are also represented. REYNOLDS's most fascinating *Nelly O'Brien*, and *Mrs. Bradyl*—who seems a type of Eastern languor—are there, and GAINSBOROUGH's *Perdita*, which, although unfinished, is the more valuable as indicating the method adopted by the master. But art is not confined to pictures. It would be vain to seek in any public or private collection for such pieces by CLODION and GAUTHERIN as Sir RICHARD WALLACE owned, and, as suggesting the comprehensiveness of the objects, we may say neither the Dublin nor the Edinburgh Museums contain more delicate specimens of

Celtic metal-work than now await a change of ownership. Then there are miniatures, jewellery, ceramics and tapestries; and there is hardly a section of art which cannot be studied in Hertford House. It is to be devoutly desired the intentions of Sir RICHARD WALLACE will be realised, and that the country will be fortunate in gaining a collection which is entitled to be considered unique. If England has the good fortune to obtain such countless objects we suppose they will be kept together, and South Kensington would become the most suitable home for them. The legacy would therefore have the further advantage of putting an end to the extraordinary delay in enlarging and completing the museum. A national laboratory is desirable, but a work which is entitled to precedence is that at South Kensington. The collections attract more visitors than any others, and strangers are not in a fit mood to enjoy them after they have contemplated the exterior of the museum and its neighbour which is devoted to patents.

THE subject of the restoration of St. Mary's Church, Oxford, again came before Congregation on Wednesday. The question to be considered was whether 1,750*l.* should be expended on the restoration of the pinnacles and battlements on the clerestory of the nave, and whether such repairs as may be considered necessary by Mr. JACKSON, R.A., should be carried out in the timber-work of the roof of the nave. The present parapet was the creation of Sir GILBERT SCOTT; the previous parapet had been blown down between 1500 and 1520. The President of Trinity defended the amount of the grant, and pointed out that it covered a contingency which was only possible, not probable. Both he and Professor CASE observed that Mr. PARK HARRISON and others deserved the greatest credit for unearthing details of the old work from Sir GILBERT SCOTT's office. Mr. JACKSON had also consented to modify his previous design, and to follow in the traces of the original work. The President, however, gave notice of an amendment relating to the proposed thickening of the parapet and other details of work on the cornice. In reply to the President of Corpus, who urged the poverty of the University chest, the President of Trinity admitted that the work might be postponed for a few years, but said it was most desirable to complete the restoration without further delay. Mr. DODD expressed the hope that the architect had himself in person inspected the roof timbers which were reported to be decayed.

A PAPER on "Hospitals and Hospital Construction" was read by Mr. F. BATCHELOR at this week's meeting of the Architectural Association of Ireland. An account was given of the earliest recorded hospitals, showing that as early as the third century before the Christian era institutions which were kindred in object to their present hospitals were in existence. In Ireland, too, hospitals were in existence as early as the third century of the Christian era. The author said it was a fact of which every Irishman should be proud that Ireland had always led the way in the founding of charitable institutions. Their own city of Dublin was the second city in the United Kingdom in the proportion of hospital beds to the population, being second only to London. Afterwards a detailed account was given of the most approved methods of hospital construction.

WHEN the old Chain Pier at Brighton was threatened with demolition several inhabitants of Brighton uttered a wail at its fate. They wished to have it preserved as a memorial of happy hours spent upon it. The November storm was not sympathetic, and the pier quickly vanished. The Brighton people can, however, possess a memorial of the structure in the drawings which Mr. J. AUMONIER has executed. In the whole history of engineering we doubt if one work has ever before been so completely illustrated. There are fifty-seven drawings, and they all are more or less interesting. With them are some examples of the artist's latest work in Lincolnshire and Sussex. They are bold examples of modern handling, and as such would gain admittance into any Paris exhibition. They are suggestive of local characteristics, and appear to be entirely produced in the open.

## WORKMEN AS CONTRACTORS.

EVERY student of political economy knows there have been fashions in the science as well as in most other things. From time to time several remedies for poverty are introduced which gain universal favour, but after a longer or shorter time they decline and disappear, as if they were of no more importance than gowns or bonnets. Although there are enthusiasts for these remedies or systems, yet, as they are not endowed with permanence, the best way to deal with them is to seize any advantage they may offer, but to remain rather sceptical about their power to bring back the Golden Age.

What is now called Co-operative Trading, the Co-operative System of Constructing Public Works, Co-operative Building and Contracting, Co-operative Manufacturing, Industrial Co-operation and so on in England, and in France is known as Association Corporative, Société Coopérative Ouvrière, Syndicat Professionnel, and by corresponding terms among the Italians, may be no more than one of those temporary expedients to settle economical problems, but it cannot be denied that it has come into favour with unusual expedition. Whether the word "co-operation" is a right designation for the new enterprises we need not inquire, but it was not used in the sense which is applied to it nowadays by economists who might claim to be so modern as to be almost contemporaries. Co-operation has long been a favourite word, but it signified combination of labour. E. G. WAKEFIELD, who gave much attention to the subject, divides it into two classes, simple and complex. As the most elementary example of it he refers to two greyhounds, as they can kill more hares when running together than four hounds when running separately. The combination of eighteen men to produce a pin was considered by ADAM SMITH as a triumphant instance of co-operation. J. B. SAY went further, for according to him the manufacture of one playing-card was incomplete in an economical sense so long as seventy men were not employed in the operations. The French economists, indeed, followed MILL in defining co-operation as "la participation des industries différentes dans la confection d'un produit." At one time political economy was supported by co-operation or the division of labour as one of its columns, and if that were removed there would be no science of economy and no civilisation.

But it is not in the sense of increased or improved production that the word co-operation is understood in modern workmen's societies. Among them it signifies an union for dispensing with the capitalists, employers, middlemen, or other industrial chiefs, and the distribution of the profits formerly claimed by them among the members of the union. This is an extension or development of a custom which was long practised on a small scale in some English occupations. The Cornish miners were able to enter into contracts with the agents; the fishermen along some parts of the coast and the crews of whalers were also able to claim a share in the profits. But the cases were few, and CHARLES BABBAGE was perhaps the first who maintained there would be an advantage if the principle were extended to all branches of manufactures. M. LECLAIRE, a house-painter in Paris before 1842, shared the profits with his workmen, and his example was followed in 1847 by M. DUPONT, a printer, and some other employers. In England, MESSRS. BRIGGS, the colliery owners, agreed to allow one-half of any profit exceeding 10 per cent. to the workpeople and employés, whether shareholders or not, in proportion to their earnings. But it was given in evidence before the Trades Union Commission that there was great difficulty experienced to prevent the working shareholders withholding the bonus from the men who did not hold shares.

In England an engineer might offer occasionally a small contract on a railway to a ganger and a few men, but in engineering as in building the system of having a responsible contractor was always preferred. The French practice of having separate contracts for the different trades was more favourable to workmen's associations. In 1882 the Municipal Council of Paris agreed to an arrangement by which such associations were allowed to tender, on the understanding that when a contract was given representatives of the men (not exceeding three in number) agreed to direct the execution of all work subject to the orders of the engineers and architects, and to accept the usual re-

sponsibilities of ordinary contractors. It was also necessary that an accident fund be provided or an engagement for that purpose entered into with a solvent insurance company. At a later time the workmen's associations were declared to be competent to undertake contracts for Government works throughout France. In order to get over the difficulty arising out of want of capital, as much as one-half of the estimated value of the work to be executed could be advanced by the Government office concerned in the operations. In Paris a large sum bequeathed by RAMPAL, the economist, is available for loans to the associations.

One of the supporters of the principle of association was the late M. ALPHAND, the director of the municipal works of Paris. Under him societies of carpenters, joiners, house-painters, paviors were employed. He said of them:—"We have workmen, associated together, who have done an enormous amount of hard work in carrying out certain contracts—contracts given to them at prices in no way higher than those at which such contracts are given out to the ordinary contractors. These contracts, I repeat, have been carried out with a remarkable degree of expedition, and the Corporation have had a substantial profit." The Department of Public Instruction and Fine Arts also testifies to excellent work executed in twenty-two contracts for the construction and repair of school buildings. The Co-operative Carpenters of La Villette were entrusted with the erection of the scaffolding for the restoration of one of the spires for the cathedral of Coutances, the contract amounting to about 570*l.*, and another Society of Stonecutters and Masons in Cahors obtained a contract for work in the apse of the local cathedral. In the latter case the rebate offered from the official estimate was 38 per cent., and therefore it is no wonder the society no longer exists. The French War Department considers that owing to the societies there is closer competition. But experience in Paris tends to show that whatever may be the impulse among ordinary contractors, there is no effective competition among the co-operative associations, as they agree not to underbid each other. The managers, on the other hand, say they are often compelled to accept prices for municipal works which are too low. In general, we believe the rate of wages for members of the associations is slightly higher than with ordinary contractors; but as skill in organisation is not a common gift, the profits are not extraordinary. M. BOUVARD, the municipal architect, has to admit that the associations do not always survive until contracts are completed, and the managers are too often changed. Weaknesses of that kind are not conducive to satisfactory balance-sheets, and in the long run the ordinary contractors are not likely to lose much by rivalry of co-operators. It is only in Governmental and municipal contracts of a picked sort that the associations have any chance; the unofficial architects and engineers of France appear to avoid them.

In England there is a similar fostering on the part of a few Governmental and municipal authorities, and no less reluctance to employ associations in works belonging to civilians. The Town Council of St. Helens at one time supplied materials for paving and sought tenders for labour alone, but a tender from an associated body of working men was never received. In Nottingham the Corporation also supply materials, and the paving, flagging and kerbing are laid by men who are almost continuously employed in the streets. They work on a sort of contract system, the prices being arranged by the borough engineer. There are weekly payments in proportion to the amount of work executed:—"Each man is paid by the head foreman according to his grade, whether a pavior, flagger or only a labourer; at the end of the special contract the work is entirely re-measured and payment made for the same; if any surplus is left in the hands of the foreman, this is divided equally amongst the men engaged on the work." It is supposed by the officials that the work is executed more cheaply and better than if done by a contractor. But there must be exceptional conditions for paving in Nottingham, for it is declared, "There has been no alteration in the amount, quantity or value of the work done under the system for the past ten years." Such constant immutability is not a common characteristic of modern municipalities.

"The Co-operative Builders of Brixton" in 1891 obtained a contract for enlarging one of the London Board

schools amounting to 2,064 $\frac{1}{2}$ . In 1892 there were two contracts, the total amount being 9,293 $\frac{1}{2}$ ; three in 1893 amounting to 8,871 $\frac{1}{2}$ , and two in 1894 which only came to 2,879 $\frac{1}{2}$ . The Board say "they have no reason to be dissatisfied" with the work done, and the tenders were the lowest submitted. The Co-operative Builders were also able to secure the contract for the Weights and Measures Office in Rosebery Avenue from the London County Council. The amount was 6,838 $\frac{1}{2}$ . It was reported that the work was "in all respects satisfactory."

The Co-operative Builders, it appears, set up in 1888, and at the end of 1889 there were 171 members with a share capital of 1,360 $\frac{1}{2}$  and a loan capital of 1,100 $\frac{1}{2}$ . But the tendency to breaking up or dissolving, which the French architect remarked as inherent in associations of the kind, was soon exhibited. In 1894 the Builders had to be reorganised, and in 1895 they were found to have forty members in all, with a share capital of 47 $\frac{1}{2}$  and a reserve fund of 279 $\frac{1}{2}$ . Yet in 1895 work to the amount of 6,634 $\frac{1}{2}$  was executed. The amount paid in wages to forty-eight men and "one young person" was 3,643 $\frac{1}{2}$ , which would mean an average of 30s. weekly. The profits were 422 $\frac{1}{2}$ , out of which the reserve fund absorbed 276 $\frac{1}{2}$ , the dividend on capital 2 $\frac{1}{2}$ , education fund 14 $\frac{1}{2}$ , benevolent fund 5 $\frac{1}{2}$ , Co-operative Union 3 $\frac{1}{2}$ , manager's bonus 45 $\frac{1}{2}$  and workmen's bonus 73 $\frac{1}{2}$ . The various sums amount to 418 $\frac{1}{2}$ , and it is to be hoped the "young person" received the balance of 4 $\frac{1}{2}$ . Apparently it is preferable to gain employment under the works committee of the London County Council than to co-operate with the Brixton builders, for the wages are higher and the work could hardly be easier. The committee are also inspired by a similar feeling towards ordinary contractors with the Co-operative Builders.

The Kettering Co-operative Building and Contracting Society does not appear to have gained a greater financial success. In 1895 work of the value of 6,793 $\frac{1}{2}$  was performed, and the profits were 484 $\frac{1}{2}$ . But that sum was diminished by 100 $\frac{1}{2}$  paid to "customers." The bonus to employes was 7 $\frac{1}{2}$  per cent. on wages, which in this case also appears to have averaged 30s. a week.

The Sheffield House Painting and Decorating Society obtained work from the Corporation in the latter half of 1895. The most important contract was at the Sheffield Sewage Disposal Works (and the decoration of such a place is a testimony to the influence of Mr. RUSKIN and the St. George's Museum), for it amounted to 157 $\frac{1}{2}$ , out of which sum 134 $\frac{1}{2}$  had to be expended on labour. Another contract was for work at the Ruskin Museum, the amount being 78 $\frac{1}{2}$  11s. 3d., and there was a supplementary contract of 38 $\frac{1}{2}$  16s. 5d. Upon the 117 $\frac{1}{2}$  7s. 8d. thus obtained the profit was 11 $\frac{1}{2}$  7s. 8d. The Corporation also accepted the Society's tender of 1 $\frac{1}{2}$  8s. for one work and 2 $\frac{1}{2}$  10s. for another. The profits were respectively 7s. and 6s. The value of the work done in 1895 was 903 $\frac{1}{2}$ , but it entailed a loss of 15 $\frac{1}{2}$ . The customers are to share in the profits, but judging by experience the amount which will be received by the Corporation for patronage will not greatly diminish the rates.

There is, or rather was, a Woolwich Builders' Society that was entrusted by the War Office with supplying thirty-four small litter sheds with corrugated iron roofs, at a cost of 400 $\frac{1}{2}$ , for the Royal Artillery Barracks, Woolwich. Whether the experiment was agreeable or not to those who had the privilege of co-operating in it we have not discovered. The Chief Registrar of Friendly Societies has had his communications to the Woolwich Builders' Society promptly returned with the inscription, "Gone away," and the place selected for activity cannot be discovered. In Canning Town there was a Reliance Co-operative Painters and Decorators' Society. The West Ham School Board, after a select competition, accepted the Society's tender for cleansing and painting one of the schools. It was necessary to set up a dado. The carpenters rebelled against the undertaking of so important a work by painters, and, it appears, "some friction between the men" followed. The School Board were no less dissatisfied about the material employed, which was supposed to be wood; but they avoided the friction process with the men, preferring to substitute proper material in the dado. The painters' operations in repairing locks, &c., were not more appreciated, and as a consequence they have vanished as completely as the Woolwich Builders'. Canning Town

also possessed another body, entitled "The London Amalgamated Co-operative Builders of Canning Town." In 1894 the West Ham Town Council commissioned the Society to construct a band-stand, which was to cost 190 $\frac{1}{2}$ . Whether the work was completed, or even commenced, is not known to us; but the Chief Registrar was able to report in the same year that the Society was in course of liquidation, and the process seems to be still going on.

It is a misfortune, perhaps, for the co-operative building associations that they can be tested by simple facts and figures. In Sheffield, Kettering, Woolwich and Canning Town there is apparently an absence of those "public men" who have the marvellous faculty of convincing their votaries that losses are in reality gains, and increased expenditure is only another phrase for severe economy. Now and henceforth the proper duty of a citizen is to believe with MACBETH that "Nothing is but what is not." When, therefore, we find that workmen are unable to make much of a dividend, we are to conclude that the obnoxious contractor out of the same work would secure a profit sufficiently large to satisfy an usurer. The experience of the co-operative builders should, however, be enough to convince people that in our time contractors rarely receive more from works than is their right.

In New Zealand, where there cannot be so perfect a system of contracting as is established in England, it is found there are some advantages in co-operative construction. But it is necessary to adopt tactics which impose additional labour and responsibility on those in charge. At first it was arranged to form parties of about fifty co-operators, and to arrange the railway or other works in sections to suit them. But as it was difficult to find that number of men to agree, the parties were reduced to ten or twelve each, and now the average number is six. But small as the party may be the co-operation is of the Irish variety, for one of the engineers has reported that "the men show no desire to co-operate with or assist each other; each one simply tries to do the best he can for himself by joining in with a stronger and better party than his previous one." In New Zealand, as in Paris or Woolwich, dissolution is inevitable, and there is no hesitation about leaving all who are responsible for the execution of a contract in the lurch. To keep the men in good-humour the prices are on a scale which "should enable a first-class workman to earn an average wage per day of eight hours slightly in excess of what a contractor would pay him for the same work." A rule was also made by the Government "to allow the engineer full discretion in giving a higher price to the weaker or more inefficient (though not to more idle) men, as these also have women and children dependent on them, and if they were to receive the prices paid to the best class of navvies, would hardly earn food for themselves." In another district there is much discontent because married men who are strangers are selected on the public works rather than single men living in the districts. The bachelors state "they do not object to married men who are residents having preference, but many of them say that married men of low repute, or with disreputable families, should not be brought from other parts of the colony and given preference to steady single men who are struggling to build a nest for themselves." Mr. RUSKIN, although he wrote "Unto this Last," never ventured to depart so far from the old principles of political economy as have the New Zealand Government. Yet the public are expected to believe that railways and the various works attempted by placing a premium on incapacity and improvidence are "better done under the co-operative than under the contract system." The contractor, when he comes across such conclusions by men in office at home and in the colonies, may well exclaim with the Swedish Chancellor, "Behold, with what unwisdom the world is ruled." It would now seem from the support given to weakness as if the French enthusiast's maxim is the guide of all in authority, "Aux plus d'ésérités le plus d'amour."

The report issued by the Board of Trade on the contract associations is mainly made up of communications from officials who are in favour of the system. There is little doubt that from a politician's point of view combination of workmen for industrial objects is more satisfactory than any for reforming a state according to immature but dangerous notions. But when it is asserted that, by

giving out contracts to associations of workmen, public authorities are insuring work that is more excellent and more economical than any obtainable from ordinary contractors, we can only consider such statements as among the delusions which it is the purpose of economical science to dispel.

## ELECTRICAL INSTALLATIONS.

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Continued from last week.)

### INCANDESCENT LAMPS.

CONSIDERABLE care should be exercised in the choice of lamps, as upon them depends to a very large extent the economical working of the plant and the satisfaction given.

*Low Voltage.*—Low voltage lamps are always more efficient and last longer than high voltage. For a private-house plant a pressure of 50 volts is to be recommended, although the wiring is rather more costly. The lamp filaments are thicker than for 100-volts, and in consequence low candle-power lamps are efficient and cheap. The thick filaments do not show any small pulsations in voltage when a gas-engine is used, and they can be run at a higher efficiency than 100, 110, or 200-volt lamps. An 8 candle-power lamp should not take more than 30 watts at the outside under any conditions, although it may be noted that lamps of 8 candle-power often take 45 or 50 watts when sold as 4-watt (per candle-power) lamps.

*Long Life.*—With a private plant lamps of long life should be used, as the extra cost of generating current is very little, because the greater portion of the expenses are fixed charges, and independent of the current consumed. It must, however, be remembered that the cost of the plant is greater for low-efficiency than high-efficiency or short life lamps.

No lamps should be bought which have not the makers' name, candle-power and efficiency marked on them; this is an important point, as very many worthless ones are sold, and invariably the information given by the marking on them is inadequate.

*Purchase of Lamps.*—Lamps should not be bought in large quantities. The reason is that even the best makers sometimes turn out a bad batch, and if a great many are purchased at one time a considerable loss may be the result. If, however, they are bought in small quantities at more frequent intervals, the average quality lamp throughout the year is the maker's average, and if the maker is a well-known one, it is almost certain that the quality will be fairly good.

A good lamp cannot be made properly at a price below the average. If every one is properly tested, the cost of testing in the various stages is too great to admit of this; also the difference allowed between the declared and the actual candle-power must be greater if the lamps are cheap, as the maker cannot afford to mark many of them to be run at a little used efficiency or voltage. The result is that cheap lamps are not uniform either in candle-power or current consumption, the filament and bulbs are not finished off neatly, and they have a distinctly inferior appearance. German lamps are not all as bad as the name perhaps infers; in fact, some of the English lamps are far worse than the average German ones.

*Diffusion and Reflection.*—The use of frosted bulbs is to be avoided as much as possible, and the lamp should be placed in such a position that it does not irritate the eyes. It is clearly a wrong principle to have a lamp of high candle-power and then to absorb a greater portion of the light with unsuitable shades, &c., in order to tone down the glare. The best shade as regards diffused reflection is one of rough drawing-paper if used suitably. These shades reflect and diffuse about 80 per cent. of the light they receive, and are far superior to the white opal ones sold to such a great extent. The shades can be made as tasteful as desired by the use of silk, &c., without injuring their reflecting properties.

There is at the present time a movement in favour of dispensing with shades, and using lamps with reflectors in very close proximity to the bulb.

These reflectors are very effective, and are no doubt

more efficient than the ordinary shade, when the light is required below the horizon of the lamp. A new class of lamp has recently been introduced, the reflector being a portion of the bulb (which is silvered); the great objection is that the plated or silvered lamp costs nearly double that of an ordinary lamp of equally good make, and when the lamp fails the reflector is also useless. A reflector or diffuser which has to be renewed with the lamp is therefore more costly. Porcelain reflectors are being made which fit the lamp closely, and are nearly as effective as the plated lamp.

Metal reflectors are not so good as a white matt surface, as they are unpleasantly glaring when placed where they are close to the eyes.

*Blackening of Bulbs.*—The blackening of lamps is a fault which has never been entirely eliminated; the carbon of which the filament is made is, owing to its high temperature, gradually deposited on the cooler inner surface of the bulb. This blackening appears to be proportional to the size of the filament, and consequently is worse in the higher power lamps. The blackening is also worse with small than with large bulbs, and the surface of the bulb should increase with the candle-power. This means that the bulb of a 32 candle-power should have twice the area of that of a 16 candle-power lamp, and so on. An 8 candle-power lamp very rarely blackens, and, if it does, it must be a bad one, as the bulbs of 8 candle-power lamps are very large in proportion. The blackening also depends upon the quality of the filament, and again upon the way in which the lamp is used. If the pressure is allowed to rise too high, the lamps blacken very rapidly even when they do not fail.

Unsteady pressure is the cause of the great proportion of the failures, and many complaints may be traced to this cause.

*Efficiency.*—High-efficiency lamps are more easily broken and blackened by unsteady pressure than lower-efficiency ones. The reason is that the filament is already at a higher temperature, and any serious increase is consequently disastrous.

The efficiency chosen for a lamp to run upon any circuit depends upon three factors:—(1) The price of electrical energy; (2) the price of lamps; (3) the steadiness of pressure. With a private-house plant, as before mentioned, a lower-efficiency lamp is desirable, because energy does not cost much per unit, and because the pressure is not, as a rule, as steady as can be obtained from a supply company's mains, where it is the duty of at least one person to watch the instruments and correct any variations of voltage.

As a general rule it may be taken that a 4-watt lamp is most suitable for use with a private-house plant, but where energy is obtained from a supply company and costs, say, 8d. per unit, a 3-watt lamp should be used if the pressure is steady, say within 3 per cent. of the declared voltage.

*Bi-life Lamps.*—These are lamps which have two filaments, but only one is used at a time. When the first filament is broken the second one can be brought into operation by lifting a metal plate on the collar; thus the lamp has a double life. This lamp is very useful when the first filament breaks soon after the lamp is bought, as it is not twice as expensive as the ordinary ones, but it is doubtful if it will come into general use, as the second filament is of very little benefit if the first filament has lasted a reasonable time, owing to the blackening. It is, however, probable that this kind of lamp would be very good with high efficiency, and might make it even possible to use a very much higher efficiency than at present employed.

*Variable Candle-power.*—There are several special kinds of lamps on the market in which there are two filaments, with a switch in the lamp cap. The filaments are of two sizes, say 8 candle-power and 16 candle-power. By manipulating the switch the candle-power may be either 8, 16 or 24, by using either or both filaments. In some of these lamps two of the filaments may be connected in series and a low candle-power obtained. With the low candle-power combination, of course, the filaments are dull, and it is extremely inefficient; but so long as this inefficiency is remembered these lamps may be used with convenience. This lamp may also be used in the same way as a bi-life one. The objection to this type is that the switch is renewable with the lamp, although it may not be worn out, and, in consequence, the cost of using these lamps is rather

high. An arrangement by which old ones could be returned to the makers and an allowance made for the switch would considerably reduce this expense.

**Caps and Sockets.**—There are two common types of terminals—the bayonet contact and the Edison screw. These two terminals have been found to be the most satisfactory in use. The bayonet contact has of late been adopted in most cases. There are on the lamp collar two plates which make contact with two spring plungers in the holder. This terminal is very satisfactory when there is vibration, as it is impossible for it to become loose. The objection to it is chiefly one of appearance, as the holders and collars are usually considered clumsy. The Edison screw terminal is frequently used for candle fittings, and consists of a central contact inside a screw collar but insulated from it. The screw collar is connected to one lamp terminal and the central contact to the other. There is a holder with a corresponding screw and central contact, to which the current is conveyed; therefore when the lamp is screwed into the holder contact is made. This terminal has been much improved of late by making the screw of smaller pitch, and it is now far less liable to become loose. There are several other types of terminals, but they are only rarely used, and are not of sufficient general interest to describe here.

It has been suggested, and I believe carried out, that lamp manufacturers should purchase the caps, platinum wire, &c., from broken lamps at a fair rate, and this would have the effect of slightly reducing the cost of lamp renewals. The value of these lamp terminals is, however, very slight, as the amount of platinum in the lamp is reduced to such an extent that the value is less than one penny when new.

**Renewal Contracts.**—With reference to the renewal of lamps, I would suggest that they should be renewed by a contractor for a fixed sum per unit of electricity consumed, he taking all risks. The lamps should be guaranteed not to consume more than, say, 4 watts per candle-power, and they should be replaced when they decrease, say, 25 per cent. in candle-power, or increase, say, 25 per cent. in consumption of energy per candle-power. Any dispute as to these last points should be settled by a test and the fee paid by the party in the wrong. By this means when the current is obtained from a supply company, unduly heavy electric-light bills would not be so common, owing to ignorance of the qualities of lamps, and the high cost of lamp renewals which are caused by lack of judgment would be lessened.

The point which must be settled before the question of lamp renewals is decided is the variations of pressure on the supply mains or private plant.

If the pressure could be *guaranteed* constant within one per cent., and in the case of a supply company, a heavy fine imposed if it were exceeded, lamps of  $2\frac{1}{2}$  watts per candle-power could be universally used, and electric-light bills would be reduced to nearly half the present amount.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Professor Aitchison, A.R.A., president, in the chair.

The minutes of the last meeting having been printed and circulated they were taken as read.

The Hon. Secretary announced the death of Mr. William Tipping, hon. Associate.

Mr. H. E. Milner, F.L.S., read his paper on

### The Garden in Relation to the House.

He said that he proposed to speak of the treatment to be adopted in laying out grounds, particularly in their more immediate relation to the house, and to indicate generally a practical application of the theories advanced.

The formal treatment of gardens reached a high state of perfection under Elizabeth, when the architect who designed the house also laid out the garden with its fore-court and broad terrace, its straight walks leading from it encompassing the flower-beds, and all harmonising with the building. Little thought, however, was devoted to the treatment of the country outside beyond the planting of avenues. Towards the end of the eighteenth century fashion ruled the destruction of most of the old formal gardens, to be replaced in very many instances by a no less artificial and formal imitation of nature. The designers were not content with amalgamating with whatever was good of the old work a natural treatment of the outlying ground, or of giving greater breadth to the existing formal

work, but swept away all this and replaced it by meaningless walks, by clumps of trees and shrubs dotted irregularly on the lawn and park, by a boundary of planting, by imitation of bits of natural scenery, by the introduction of artificial ruins and such-like objects, with the desire of making a picturesque landscape. The author then went on to speak of the happy mean between the formal and the picturesque treatment.

He differentiated greatly between the treatment of terraces, walls, steps, balustrades, &c., in stone and verdure. Architects should extend their work in the garden in connection with the building; but this work should go hand-in-hand with the composition of the greater picture which the art of landscape-gardening should produce. The increased resources of modern horticulture should be taken into account; not merely the eye but the mind should be appealed to by the beauty of composition of line, colour, perspective and grandeur; a liberal art should not degenerate into a mechanical one. Places differed in the conformation of the ground, in climate, in soil, in the requirements of the owner, in the amount to be expended, and in the possibility of an extension beyond the immediate precincts. It was therefore futile to lay down any hard-and-fast rules for design.

The author then proceeded to treat in detail of the site, the approach, the terrace and the garden formation and planting. The approach to a house should always appear to be direct, and any deviation from such directness should not only arise from, but should also be made to arise from, some decided obstacle. By direct was not meant straight. A straight approach required careful treatment. It was artificial in character, it could appropriately be used when an imposing or somewhat pretentious building was at the end of it, or when the distance was short and when the country was flat. In sloping ground, it should, if possible, be made against the slope of a hill. The gradient should be even and flat, or very slightly and continuously curved, otherwise it would appear not straight. If the ground be very undulating, a straight road is out of character with its surroundings. A curved line of road was generally to be preferred, as being more easy of construction, more varied views could be obtained, its gradient could be varied, following within limitations the natural undulation of the ground, and the side slopes could be more easily and freely dealt with than the sides of a straight drive. Width of walks and drives, entrances, were discussed in detail by the author. A gradient exceeding 1 in 14 should not be introduced, although 1 in 9 might be safe.

The lodge and entrance gates belong to the drive, and should be parallel with and at right angles to it, as distinguished from the highway. The face line of lodge should be at least ten feet from the edge of the drive, and its windows should be able to command the entrance and a certain length of drive. On entering by the drive it was advisable to create a good impression, and therefore to mark distinctly the difference between the dusty highway and the shaded, well-trimmed drive within the gates. Planting might be introduced on either side of the entrance, but once well inside a view should be given of the outlying grounds, or stretch of park, or distant wood. A curved drive should not be planted continuously, but broad masses of planting introduced, at first to shut off the highway, at turns in the drive, and on the top or slopes of knolls round which the drive may wind. The drive should not skirt the garden or overlook it.

The direction and level of the approach, and the character of the architectural features, ruled greatly the plan to be adopted for the treatment next the house. The treatment of the terrace also depended very much on the architectural character of the building. By "terrace" was meant not only the narrow strip of level ground placed parallel with the house, or the more stately portion—often with architectural adornments—laid out along the face of the structure, but the whole of the ground that formed the base or setting of the building.

Having next discussed the various forms of terraces, the author passed on to the treatment of the garden proper, quoting partly from his book on the subject, which defined the system he advocated. So many considerations press in to vary the design in the general plan of a garden, that arbitrary dealing by imposition of what may be termed paper designs, however ingenious, was ill-advised. The detailed plan should spring from the site as an adaptation of its natural, or created natural, features, and should not be forced upon the position, crushing it to an artificial scheme. To copy simply the design of another place is inadmissible. Considerations that rule in this connection were almost infinite—extent, geological formation, soil, existing natural formation or features, climate and aspect, the display of distant beauty, conformity to outside influences, particularly to the requirements of the possessor and the expenditure of money that may be made. There were points of similitude between the painter's art and landscape-gardening; but the landscape-gardener must consider that his colours change and grow; he must realise, as he creates his picture, that in a few years what now seems like a light green stroke of pigment to the painter may have become a tall tree, beautiful in itself, but of altered beauty, either helping or marring the landscape. He must

follow nature by adapting or garnering her beauties, and tutoring her, so to speak, to a display of them. But by following nature was not meant a slavish imitation or reproduction of any of her particular scenes. Some were unattractive, some very inappropriate—all were subject to dissimilar conditions, and imitation in nature as well as in art produced pettiness. But the spirit of the beauty of nature, embodied as it were in those of her works or features that express her majesty, simplicity, peacefulness, sweetness, repose, refinement, strength and variety in form, colour, abundance, or any of her modifications as parts of loveliness, should be included and brought into juxtaposition in an ideal scene so far as it was possible to promote its natural development. The terrace, the region immediately next the house and the general arrangement of the walks and gardens having been discussed, the author next dealt with the most suitable positions for planting trees and shrubs, principles of grouping, the effect of colour on distance, character of foliage, &c.

He maintained that they should carry out in the parts surrounding the house the architectural feeling of the design in terraces, walls, steps, basins, beds, and so form a base; that they could still have the dignified and quiet delight of formal work—not a narrow curtailment of the whole design. But there was in addition a broader treatment beyond—a work difficult to proportion in relation to foreground, to broad lawn-spaces, to grouping, and choosing trees and shrubs for effect in size and colour, to directing the eye to desired points, to taking advantage of climate and character of the place, either natural or acquired, to provision of light and shade in the undulation of the ground, and to a knowledge of horticulture. This art-gardening was far beyond the limitations of formal work only, for it could apply the balance and proportion of the latter, and, in addition, present a noble conception of art-work, in its execution of outline, surface-formation and grouping, and draw into the picture the greater, broader, varied landscape.

In conclusion he expressed thanks for having been elected an hon. Associate of the Institute.

The Hon. Miss Amherst agreed with the paper on all points, and thought that it would be interesting both to those who studied architecture and also those who were concerned in horticulture. In designing a modern garden the employment of flowers must be taken into consideration.

Mr. Aston Webb proposed a vote of thanks for what he considered was an admirable paper and full of useful information. It would be impossible to choose a more delightful subject than gardening, and one that would help us more to realise the beauties of nature. The most pleasing garden was, however, incomplete without the house, the same as a beautiful house was incomplete without a garden. Therefore, the landscape gardener and the architect should work together. The formal garden they were striving for was the formal garden of England, not that of Holland and Italy. But the garden of Hampton Court, Hatfield House and many others contained high hedges and long alleys, besides lawns to walk upon. Sedding, in his book, maintains that the art of gardening declined when the "ha-ha" was introduced; and there is little doubt that a change took place about that time. Some people had the idea that architects wished to surround a house with four high walls, and to call the enclosure a garden; but this was a fallacy. Mr. Milner, in his paper, said the walls of courtyards of houses should be no more than 3 feet high; surely that was a mistake, 9 or 10 feet was the height for them. The great principles of a garden were the prospect, shadow, and a certain amount of mystery. "Alleys green should lead where none would guess." The design of the garden should be apparent, and man's hand visible, as any attempt at naturalisation was a drawback.

Mr. Statham did not altogether agree with the lecturer's idea of what constituted a formal and informal garden; at present we were in a sort of reaction. Hampton Court, as it now stood, was an ideal of a garden near the house, but then it was not the garden that one sees in old engravings; it was vastly superior to what it was then; it was now a formal garden. It was no good making a landscape which tended to be natural, but which one could see was contrived. Another point to be observed was the use of dark and light coloured trees in perspective. He seconded the vote of thanks.

Colonel Prendergast thought Mr. Milner had fallen in between the formal and informal style; he did not uphold either one nor the other alone. Each generation had to deal with the difficulty of making an English house more beautiful than it was before. The principles now had changed, as the buildings of to-day were built on the hill instead of in the hollow. This alteration was important, and the plans of gardens must necessarily be adapted to it.

Mr. John Hebb, L.C.C., also spoke.

The President said everybody born in England would have a taste for a garden, whether formal or informal. There was undoubtedly a charm about the formal style. When Milton poke about a trim garden, it was difficult to decide whether he

meant a well-kept natural garden or a formal one. There was something delightful in the former. The information Mr. Milner had given he thought would be useful to every architect.

Mr. Milner, in reply, said the only rational way to treat a plan was to adapt oneself to the surroundings. As regarded Hampton Court, it should be taken into consideration that the avenue was made when the surrounding fringe of houses was not there. The work of the landscape gardeners was to be able to form in their minds how the picture would look when they had finished with it. Thus the very old gardens had a picturesqueness in the ancient trees themselves, but that was not so much in the design as in the character of the trees. As regarded a wall 10 feet high, mentioned by Mr. Webb, he would be sorry to see such a thing round the courtyard of a house. The place would not be a pleasant one to live in or walk about in; besides, a man wished to obtain a view of the scenery beyond.

The President announced a special general meeting on March 1, to elect the royal gold medallist for the current year, and at its conclusion an ordinary meeting would be held for the election of members and discussion of the following professional questions, viz. :—

1. On the motion of Mr. Owen Fleming, "That it should be referred to the science standing committee to consider the desirability of formulating a definite standard size for bricks."

2. Mr. Robert Williams to ask whether the Institute of Builders had agreed to abide by the provisions of the form of contract sanctioned by the Institute. At the same meeting a paper would be read by Professor Leopold Eidlitz, on "Education."

### ECCLESIASTICAL DILAPIDATIONS.

AT the Stourbridge County Court on the 11th inst. a case sent down from the High Court was heard. The Rev. M. N. Kearney, late vicar of Rowley Regis, and now rector of Oulton, near Lowestoft, sued the Rev. D. Turner, the present vicar of Rowley, for 147*l.* 6*s.* 8*d.* The claim was a long one, including 47*l.* 0*s.* 6*d.* the price of goods sold and delivered; 7*l.* 1*s.* for moneys paid by plaintiff for use of defendant; 51*l.* 3*s.* under an agreement to pay half the amount of the fixtures money at Oulton Rectory assessed by the diocesan assessor of Norwich; and 42*l.* 2*s.* 2*d.* moneys had and received by defendant for the use of the plaintiff. The claim for 7*l.* 1*s.* was abandoned by plaintiff, and defendant had paid into court 96*l.*, there being included in that sum the 51*l.* 3*s.* mentioned.

The Judge asked Mr. Hugo Young, for defendant, what was the question to be tried? Mr. Young said he could not say in a word, but the 47*l.* claimed was for goods said to have been sold, and various questions arose as to what was sold.

Mr. Parfitt, for plaintiff, said the 47*l.* was claimed in respect to certain fixtures left at Rowley Regis Vicarage when Mr. Kearney left. There was a sort of triple exchange of livings at the time. There was an agreement (which he put in) between Mr. Kearney and Mr. Turner of April 14, 1896, in which Mr. Turner agreed to take to the fixtures at Rowley Regis Vicarage, which Mr. Kearney himself had taken from a previous vicar, Mr. Linklater, less a reduction of 5 per cent. on the gross sum paid to Mr. Linklater. Besides the articles which were controlled by the first agreement, there were certain others which Mr. Kearney left at Rowley Vicarage, and for which he paid or exchanged for other articles. Mr. Kearney was examined as to the agreement with Mr. Turner and as to various items for which he claimed under that agreement. Among the items was 10*s.* for manure dug into the vicarage garden.

His Honour remarked that there was a question as to whether that came under the head of goods sold.

Mr. Parfitt said Mr. Turner would get the benefit of it.

Mr. Young: Is it goods sold?

Mr. Parfitt: I will abandon that item.

Mr. Kearney gave evidence as to a claim of 9*s.* for half a ton of coal he left behind at the vicarage.

His Honour: Eighteen shillings a ton? Nine shillings a half ton for coal in a coal country? (At a later stage the value of the coal was assessed at one shilling.)

Mr. Kearney gave evidence as to the items of his claim, which included a kitchen range, hot-water apparatus, window rollers, a boiler lid, bookcase, shelves in pantry, picture rods, gasfittings, &c. There was cross-examination as to whether a number of the articles were not part of the permanent fixtures at the vicarage, and as to other points.

Mr. Young addressed his Honour for the defence, and called Mr. Lewis Sheppard, diocesan surveyor, who said in June last he made a survey of the dilapidations at the vicarage under the order of the Bishop of Worcester. He saw certain fixtures in the house over which he had no control, but there were other fixtures which he had to regard as part of the freehold, and he assessed dilapidations upon them. These included some of the things which plaintiff claimed for. In cross-examination witness said he knew there were differences of opinion among diocesan surveyors as to what were fixtures.

His Honour held that some of the things claimed for were

part of the freehold, but found for the plaintiff as to the remainder. His verdict was for 32*l.* 14*s.* 1*d.* in addition to the 96*l.* paid into court, with costs.

Mr. Young said he was sorry to say that this would not be the end of the litigation between the parties. When they exchanged livings, the dilapidations at Rowley Regis had to be investigated under the Act of Parliament by the bishop, and these had been assessed at 22*l.* They should have to sue Mr. Kearney for that sum. It was true there was an agreement under which Mr. Turner agreed to bear the amount of the dilapidations, but it would be shown that Mr. Turner was induced to enter into that agreement through misrepresentations by Mr. Kearney that the dilapidations were mere trifling things. When the state of the house, however, came to be investigated, and Mr. Kearney's furniture was removed, dilapidations amounting to 22*l.* were discovered. He asked for the amount recovered under the present action to remain in court till a decision of the other claim.

Mr. Parfitt said it was unprecedented to make such an allegation of fraudulent representation against a respectable gentleman. He opposed the application, and denied there had been any misrepresentation.

His Honour said he most sincerely regretted to hear that, after sitting there the greater part of the day trying the case, there was to be more litigation between these parties. He could not interfere.

Mr. Young asked his Honour to stay execution, to give defendant an opportunity of deciding whether he would appeal against the judgment.

His Honour assented to this.

### THE STUDY OF EARTHQUAKES.

ON Friday a lecture was delivered by Professor John Milne, F.R.S., at the Royal Institution, on "Recent Advances in Seismology." The lecturer spoke of the great strides which have been made during the past eight years in the knowledge of the cause and duration of earthquakes, and described the various instruments now used for recording earth movements. He observed that only recently an earthquake was looked upon simply as a transient phenomenon lasting a few seconds, or at the most two or three minutes, whilst now, by the aid of the seismograph, it was possible to discover and record all the tremors preliminary to and following an earthquake. Having described the various movements of the earth's crust and their cause and effect, the lecturer proceeded to speak of his work in seismology in Japan, where he pointed out that upwards of 1,000 earthquakes a year were recorded. A large number of the residents in Japan were now seized with a desire to study seismology, and one result of that eagerness would be to revolutionise the study of earthquakes throughout the world. So far had the Japanese advanced in a scientific knowledge of the subject that they had now entirely altered the character of their buildings so as to considerably mitigate the loss arising from earthquakes. This desire to study seismology had been encouraged by the Japanese Government, which had liberally subsidised a committee to carry on experiments throughout the country with regard to earthquakes and earth movements. Among other matters, the lecturer mentioned that an earthquake could be felt at any spot in the earth, and that from his residence in the Isle of Wight, with his most improved instruments, he had been able to take records of two of the most destructive earthquakes which had taken place last year in Japan. In one case he secured a record, and predicted that an earthquake would be found to have occurred in Japan at a certain time, and in the result his prediction was verified, his only error being that he was one minute out. The lecture was illustrated by a series of lantern slides depicting the effects of earthquakes in Japan, and showing the most recent improvements in seismographical instruments. Several pictures were also shown of buildings in Hereford which were damaged by the earthquake in the Severn Valley last December.

A circular is about to be issued, signed by Mr. G. J. Symons, F.R.S., chairman, and by Dr. C. Davison and Professor J. Milne, F.R.S., joint honorary secretaries of the seismological committee of the British Association, inviting co-operation in an endeavour to extend and systematise the observations of earthquake disturbances. Similar instruments should be used at stations in all parts of the globe, and the committee recommend one in particular as being simple to work, and as furnishing results sufficiently accurate for the main objects in view. The committee ask all those to whom they address the circular whether they are disposed to purchase and make observations with one of these instruments, the cost of which, including photographic material to last one year, packed for shipment, is about 50*l.* "Should you reply in the affirmative," they say, "we shall be pleased to arrange with a competent maker for the construction of an instrument for you, and to furnish instructions respecting installation and working. In case an instrument be established at your observatory, we should ask that notes of disturbances having an earthquake character be sent to us for analysis and comparison with the

records from other stations. From time to time the results of these examinations would be forwarded to your observatory. The first object we have in view is to determine the velocity with which motion is propagated round or possibly through our earth. To attain this, all that we require from a given station are the times at which various phases of motion are recorded, for which purpose, for the present at least, we consider an instrument recording a single component of horizontal motion to be sufficient. Other results which may be obtained from the proposed observations are numerous. The foci of submarine disturbances—such, for example, as those which from time to time have interfered with telegraph cables—may possibly be determined, and new light thrown upon changes taking place in ocean beds. The records throw light upon certain classes of disturbances now and then noted in magnetometers and other instruments susceptible to slight movements, whilst local changes of level, some of which may have a diurnal character, may, under certain conditions, become apparent." It is requested that replies be addressed to the Seismological Committee, British Association, Burlington House, London, W.

### RECENT EXCAVATIONS AT ATHENS.

A CORRESPONDENT of the *Times* says the excavations carried out by the Greek Archaeological Society on the north-west slope of the Acropolis have led to some interesting discoveries. Near the Klepsydra or well mentioned by Pausanias (i. 28, 4) and at some little height above it are two caverns which have been generally identified by archaeologists as the grotto of Apollo and the grotto of Pan. In the former are numerous traces of niches made for the reception of votive offerings. It was customary for the archons at the expiration of their year of office to inscribe their names here, either on the rock or on marble tablets. No similar traces, however, are found in the other cavern. The excavations now conducted under the superintendence of M. Kavvadias have revealed two other larger and deeper caverns in the adjacent rock which are connected by an aperture. This was undoubtedly the shrine of Pan in which Myrrhina (Aristophanes, *Lysistrata*, 911) proposed to Kinesias that their marriage rites should be celebrated. The whole precinct was in all probability originally sacred to Apollo, but when the worship of the Arcadian shepherd-god was introduced at Athens shortly after the battle of Marathon the deep recess in the rock, which resembles his shrines elsewhere, was chosen as a suitable sanctuary for the rustic deity. The cult of Pan was instituted by the Athenians in consequence of the apparition seen by the famous courier Pheidippides in the mountains of Arcadia when he was sent to invoke the aid of the Spartans against the Persians.

A little to the north-east of the grotto has been discovered a flight of steps cut in the rock and apparently leading to the summit of the precipice. The steps can be traced to the base of a buttress of Mediæval masonry which supports the wall of Cimon. The upper portion of the staircase which lies within the wall was discovered by M. Kavvadias in 1886. It now appears certain that these are the steps by which the Persians scaled the Acropolis, and it also seems probable that this was the passage by which the Arrhephoroe, or sacred virgins, made their annual descent to the precincts of Aphrodite, bearing on their heads the sacred vessels of Athena.

### MR. P. W. ADAM, R.S.A.

AT the last assembly of the Royal Scottish Academy there was an election of a successor to the late J. Denovan Adam. There were three candidates, viz. Mr. P. W. Adam, Mr. G. O. Reid and Mr. A. Roche. Mr. Adam, who was successful, is, says the *Scotsman*, a son of the late Mr. Patrick Adam, of the firm of Adam & Sang, writers to the signet. He was educated at the Edinburgh Academy, and afterwards received his art training at the Royal Institution classes and in the Academy's Life School, where he was a prize student. He began exhibiting pictures in the Royal Scottish Academy exhibitions about 1872 or 1873, among his early works, which were favourably received, being *Alice in Wonderland* (1882), which is now on loan in the Dundee permanent gallery; *Ave Maria*, of the same year, which was his first introduction to the Royal Academy, and *The Sisters*, also shown in the early "eighties." He was elected an Associate of the Scottish Academy in 1883. In 1887 he was in Italy, and painted a number of Venetian scenes, which were exhibited at the Mound and other galleries. One of these, *The Ducal Palace*, was bought and presented to the Aberdeen Art Gallery. During the past few years Mr. Adam, while still painting figure-subjects, has given some attention to landscape, his handling of which has been a good deal influenced by the freer methods of the Glasgow school. Two figure-subjects, however, of his, *In the Studio* and *Christmas Cards*, have been purchased out of the Scottish Academy's exhibitions for a gallery in Bishop Auckland, New Zealand. This year he exhibits a figure-picture called *Morning* and three landscapes.

### NOTES AND COMMENTS.

IN the series of plates by JOHN SELL COTMAN which recently appeared in *The Architect* was one of Château Gaillard, the fortress which was erected by RICHARD I. So many analogies are found of late years between the language, legends and literature of Europe and of Asia, we need not wonder if the Anglo-Norman fortress has captivated the attention of M. DIEULAFOY because it recalls something he saw when with his wife he was exploring Susa for archer's friezes and other novelties. In a paper read before the Académie des Inscriptions he explains that Château Gaillard exemplified the beginning of a new era in military engineering, and therefore was evidence of the innovating spirit which inspired the ecclesiastical architecture of the period. What seems more remarkable is that M. DIEULAFOY traces the development of the Norman castle through the Syrians and the people of Palestine (from whom the Crusaders derived the idea of a more scientific system of fortification) to the Persians, and then to Chaldea-Susa. He drew a comparison between the views of the château, Assyrian and other fortresses, and also with buildings erected by the Crusaders, and demonstrated their affinity with the aid of several illustrations.

THE drawings illustrating his "Wanderings in Italy" which Mr. A. WALLACE RIMINGTON has produced show unusual facility in representing buildings. He does not linger over detail, but he suggests enough which memory or imagination can complete. Mr. RIMINGTON has often the good luck to discover points of view which are more satisfactory than those which are common. The view of the tower of Siena is one example. The landscapes are also attractive. Among the 138 drawings, not one appears to be laboured; all seem to have been completed with ease. But they are effective, and suggestive of Italian colour as well as form. Mr. RIMINGTON has visited Genoa, Torcello, Siena, Viterbo, Bologna, Verona, Naples, Volterra, Mantua, Milan, Venice, Modena, Cremona, Trent, and Padua, and his hand is competent to represent the varieties of landscape and buildings which still have survived the rage for improvements which the genius of finance has inspired.

THE highest price demanded for a drawing in the exhibition of the Dudley Gallery Art Society is 50s. (the work of a lady), and the majority can be obtained for less than 5s. It could not be expected that with such prospects the artists would fill the room with 291 masterpieces. But there is a good deal of sincere, if tentative, work to be seen. Landscape, as usual, prevails. The president, Mr. WALTER SEVERN, deserves his rank by the superiority of his work; Mr. CLAUDE HAYES, Mr. CARTWRIGHT, Mr. POCKOCK, Mr. D. GREEN, Mr. M. SMYTHE, Mr. A. STEVENS, Mr. ALDRIDGE, Mr. N. E. GREEN, Mr. WETHERBY, and Mr. CARLISLE also deserve mention. Those who speculate in drawings can gratify themselves at a cheap rate. There are several excellent drawings of architectural works, Miss M. BERNARD's "blottesque" examples from continental towns being obtainable at a tithe of the sum usually expected for that sort of execution. For amateurs who have frugal minds the Dudley Gallery is worth a visit; they can become patrons of art on most economical terms.

THE Société des Artistes Français must feel rather alarmed at the demolition of the building where the Salon exhibitions were held of late years, for after 1900 who can say what arrangements will be made concerning the Palace of Arts which is to be erected on the site? But while much allowance must be made for those who have received a decree of ejectment, it is hardly becoming on the part of the council of so important a society to display so much pettishness in dealing with so simple an affair as the sharing in an exhibition in Brussels. The Belgians are, of course, eager to obtain examples of modern French art for their forthcoming international exhibition. The Minister of Fine Arts in France considered it would be best to leave the selection of examples to a jury, one-fourth of them selected from the Académie des Beaux-Arts, one-fourth from the Société des Artistes Français, one-fourth from the rival Société des Beaux-Arts, and one-fourth to be nominated by

the Government. The Salonists could therefore be assured of one-half of the jurymen, for the Academicians belong to the older society, and would also have a share of the nominees of the Government. They are, however, monopolists, and as they did not constitute the whole of the jury, it has been decided that the Société des Artistes Français will take no part in the Brussels International Exhibition either as jurors or as exhibitors. It is the action of a spoiled child, a rôle which has been long performed by the members. French Governments are not disposed to treat kindly that sort of waywardness, and if no loss arises from the absence of the representatives of the Salon at Brussels, it may also be considered good policy to dispense with them in the universal exhibition of 1900. That would be a grievous loss to visitors, but the Society would also suffer.

FRANZ SCHUBERT, "the most poetic of musicians," was born in a small house in the Himmelpfortgrund, Vienna, on January 31, 1797. The centenary of the event has been celebrated not only by performances of his works, but by an exhibition which was promoted by the Municipal Council. All the portraits of the master of song-writing that could be procured are shown, as well as those of his friends. Few men were more indebted to friendship, for without the aid he derived from a few enthusiastic admirers of his genius SCHUBERT could not have attained his thirty-first year. The Council recently commissioned Herr SCHMID to paint a picture showing SCHUBERT surrounded by those Viennese who esteemed him as the most delightful of composers.

THE arrangement of the competition for the Westbar Fire and Police Station announced by the Corporation of Sheffield will not, we hope, be taken as an example for imitation. There can be no objection to limiting the competitors to architects living in Sheffield, or to entrusting the selection of four designs to the president and two past presidents of the Sheffield Society of Architects and Surveyors. But why are members of the society alone to be considered eligible for taking part in the competition? There are many architects who on principle keep aloof from societies, whether local or imperial, and it cannot be said that their ability as designers or as men of business is deteriorated in consequence. There may be representatives of that class in Sheffield; but as the spirit of trades unionism has been always of excessive power in the city, we suppose it is assumed that a non-society architect should be made to suffer for daring to be independent. The scheme is not, moreover, likely to be advantageous to the Sheffield Society of Architects and Surveyors. There never was a competition in which the awards were accepted as satisfactory, for unsuccessful candidates do not believe sufficient pains were taken to understand their designs. The youngest students are as much liable to that weakness as senior practitioners. If by any act the officers of a society are considered to be inequitable that society is not likely to flourish. We hope such a result will not follow on the Westbar Fire and Police Station competition. The authors of the four designs considered to be most meritorious will each receive a premium of 15s. In addition to receiving a premium, the author of the best design will be entrusted with the carrying out of the work at the usual rate of commission. The total cost of buildings, exclusive of furniture and special fittings, is not to exceed 7,000s.

ELY CATHEDRAL—THE REREDOS.

DESIGN FOR REBUILDING NORTH BRIDGE STREET, EDINBURGH.

THE design by MESSRS. MARSHALL & BRADLEY, of Westminster, was submitted in the recent competition. The main elevation is the north one, which is visible from Prince's Street, on the other side of the valley. The perspective was taken from the nearest point approachable, some 200 yards away, and for this reason the designers relied for effect rather on mass and outline than on elaboration of detail. The endeavour has also been to lead the eye up gradually from the lower buildings surrounding the site to those on the Bridge Street level, 50 feet above.

## ELY CATHEDRAL.—IV.

*Recent Works.*

I WILL close my paper with a brief statement of recent works so far as they have come under my own observation.

I should premise that during the last century very extensive works were carried out in the cathedral under an able architect, Mr. Essex. These works embraced important repairs, the re-leading and remodelling of the central octagonal lantern, and the entire transmutation of the position and arrangement of the choir.

I have already stated that the choir originally occupied the space under the central tower and two bays of the nave. Its altar arrangements extended into the eastern arm, the shrines of the saints occupying the apse.

When Northwold added his vast presbytery these arrangements were somewhat modified, the shrines being moved into the new work. Whether it was then that the arrangement involving two altars, viz. the choir altar and the high altar behind it, was introduced, I am not able to say.

When Walsingham converted the central space into a vast octagon, it would not appear that he introduced any great change in the previously existing arrangements. The Norman choir screen had escaped, but all other choir fittings seem to have been destroyed by the fall of the tower and were renewed, but, so far as I can tell, in their old positions.

Instead, then, of the octagon being an open as at present—so well suited for preaching and other extra-choral uses—it was cut through by the choir, whose stalls with their lofty canopies and screens effectually screened its two flanks from the central space.

It remained so till the time of Essex's repairing, and though a little inconsistent with the beauty of the central octagon, I could wish that it had so remained, for then we should have seen unaltered the arrangements as left by Walsingham, Prior Cawdon and Bishop Hotham; and in reference to which their tombs and those of all subsequent dignitaries were placed. The Chapter, however, for whom Essex acted, determined to bring matters to something more approaching what they conceived the normal type, and so thrust the altar back to the eastern wall of Northwold's work; and, as the space between that and the octagon was needlessly long, they placed their screen two bays eastward of it; thus, instead of the choir encroaching by two bays, as it had once done upon the nave, they made the nave encroach two bays upon the eastern arm which they had nominally adopted as their choir.

Things remained, as I imagine, pretty much as left by Essex till the time of the gifted and zealous Dean Peacock.

My own recollections of the cathedral date from 1828, at which time I recollect that the remaining half of the western transept (which, by the way, had been shorn of its apsidal chapel of St. Catherine) was a mere rough workshop or lumber-room cut off from the church, while the lantern storeys of the western tower were shut out from internal view by two timber floors. I well remember, however, being filled with admiration for the beauty of these parts, though only seen under the greatest possible disadvantages.

When Dr. Peacock took the office of dean he set vigorously to work to remedy the ills which his cathedral had suffered. He restored the interior of the western transept, reconstructing the chapel of St. Catherine. He cleared away the obstructions from the western tower both above and below; restoring to view its glorious lantern stages, he set to work to cleanse the interior from its coatings of yellow wash, and to repair the decaying Purbeck marble.

These works were carried on, by the aid of a clerk of the works, under the personal direction of the Dean and of Professor Willis, assisted by the Rev. Mr. Stewart, who was then the precentor, and, as I believe, with the occasional, though non-professional, advice of Mr. Basevi, who so unfortunately lost his life while accompanying the Dean over the works going on in the lantern storeys of the western tower.

In the autumn of 1847 I was honoured by the appointment of architect—I will not say to the cathedral, but to the rearrangement of the choir—the other works going on much as before, whether under me or not I hardly know.

As the ancient arrangement had been effectually lost, we made no attempt at its recovery, but contented ourselves with the correction of the obvious faults in that which existed, at the same time determining, as the ancient screen had ceased to exist, to open out the choir to the nave by the adoption of an open screen.

On the suggestion of Professor Willis, we followed the precedent existing in Henry VII.'s Chapel at Westminster, of retaining only one returned stall on either side, viz. those of the bishop and the dean. For it may be mentioned that, as the bishop took the place here of the former abbots, he took also their stall on the south side of the entrance, the prior retaining his stall on the north; and when the prior became the dean, he simply retained his old place, the bishop also retaining his.

So that the dean here occupies traditionally the side opposite to his customary position.

The eastern arm of nine bays in length being too long for a choir, we brought forward the screen to the eastern piers of the octagon, and cut off two bays (I should have wished three) at the east end, as an ambulatory connecting the aisles.

I will say nothing more of this work as it is before you, excepting that it was most satisfactorily carried out, so far as the woodwork was concerned, by the late Mr. Rattee, of Cambridge, aided by his foreman, Mr. Kett, who on Mr. Rattee's early death became his successor; but is now, I regret to say, deceased.

Alan de Walsingham's stalls were of course retained—I regret I did not retain some of the fronts of the desks which remained, but in a very altered condition.

The monuments which had been removed by Essex were replaced to the best of our judgment, for the old arrangement having been departed from, their perfect restoration to their true positions was impracticable. The canopy, or rather the half of a canopy, which we found to overshadow very clumsily the removed tomb of Bishop Hotham, was found to be, in all probability, the substruction of St. Etheldreda's shrine, and was completed from its existing remains. This suggestion of its original use was, I think, due to my talented friend Mr. Burges.

Since that time the internal works have proceeded gradually as funds would permit.

The most notable among them has been the introduction of a richly painted ceiling throughout the nave. This had been previously covered with a plain cradle roof, ancient, but hardly intended to remain visible. The painting of this roof (or rather of the ceiling affixed to it) was nobly undertaken by a most talented amateur, the late Mr. Le Strange, of Hunstanton Hall, Norfolk, who had previously practised his hand most successfully in painting that of the western lantern.

On my suggestion he visited Hildesheim, where a then untouched ceiling of a corresponding date remained, and on that he based his design, though making it in all its details original, and a most excellent work, tending through the reserve which characterises its colouring to increase rather than to diminish the apparent height of the interior. Its compartments contain admirably studied subjects illustrating the sacred history of man.\*

Unhappily he was not spared to finish his noble work, but died when about two-thirds of it was completed. It was then in the most chivalrous spirit taken up and completed by his friend and brother-amateur, Mr. Gambier Parry, of Higham Court, Gloucestershire. So that we owe to non-professional talent this noble addition to the internal beauty of the church.

The next great work to which I will allude is the reparation and restoration of the woodwork and its leaden covering of the central octagon and lantern. This was carried out by a special subscription, as a fit memorial to the fame and earnest zeal of Dean Peacock.

In carrying out this work I gave great study to ascertaining, as nearly as was practicable, the ancient design, much of which had been lost and much obscured by the repairs of the last century.

I had the satisfaction of proving the greater part of the timber-work to be original, having from the bottom to the top the carpenters' marks of Walsingham's workmen, and by which, having prepared their work in the field, they were enabled to put it together in its place.

This investigation proved the view taken by Browne Willis to be in the main correct; indeed, we found the very mortices into which the angle turrets he shows were framed, and we again made use of them for the restored work. I have in my reports detailed the evidence discovered, and will not here dwell upon it further.

The internal painting of the lantern, with its groining, of which the original accounts and many vestiges exist, still remains to be restored; and for this we again take the proposals of talented amateurs.

I should mention that the repairs of the central lantern, &c., were carried on under the zealous care of Dean Goodwin, now Bishop of Carlisle, who at the time made most careful researches into the ancient accounts of Walsingham's time with reference to this great work. He discovered the complete accounts of the bells introduced into this central campanile, which were then not well known, but have since been published by Mr. Stewart.

His periodical circulars, printed at about this time, particularly that for 1865, will be found to contain most interesting matter relative to this and other works (such especially as the ceiling of the nave); one discovery made by him I will give in his own words:—

"The most curious discovery that I made at Ely was the marks of the lantern bell-ropes upon the vertical mullions (if they may be so called) on the south side of the lantern. I recorded this in one of my periodical fly-sheets, and I think I have mentioned it in a note to my 'Recollections of a Dean' in

\* Mr. Le Strange's work begins with this inscription:—"Sit splendor Domini Dei nostri super nos; et opera manuum nostrarum dirige super nos, et opus manuum nostrarum dirige." Mr. Gambier Parry's work terminates with the following inscription:—"Non nobis, Domine, non nobis, sed nomine tuo da gloriam."

'Essays on Cathedrals.' The ropes converged (as the marks show) to the northernmost (easternmost?) pier of the south transept, and upon that pier you may still see the marks of two pegs or nails, upon which I presume the ropes' ends were twisted when not used. You may remember that there used to be a question in Le Strange's time, How were the bells in the lantern rung? This discovery entirely settles that question."

The more recent works have consisted in—1. The restoration of the western portal and door.

2. The reparation of the western tower, which had again shown the effects of undue pressure; and has now, besides other repairs, been bound together by a splendidly executed system of iron ties.

3. The repairs of the buttresses and foundations of a part of Northwold's work, which showed signs of weakness after an unusually dry summer. These foundations are based on a thin and superficial rock, while those of Walsingham's work go down to one of a more solid character, to which we have underpinned the buttresses we dealt with.

4. The application of a similar process to the eastern angle of the south transept, which also showed great signs of weakness, and

5. The repairing of the nave from the west end as far as the octagon.

I may mention in addition to all other works,

1. The immense extent of stained-glass throughout the cathedral, introduced mainly under the zealous auspices of Canon Sparke;

2. The addition of subjects in relief (evidently intended by Walsingham) into the flat niches over the canopies of the stalls. These were suggested by myself, but have been carried out through the energy of Canon Sparke, to whom also we owe the brass lectern and many other benefactions.

3. The new pulpit under the octagon.

I will only add to the above already too lengthy sketch a list, which may be interesting, of the examples of different periods of architecture which our cathedral offers to the student and the antiquary.

- |  |  |
|--|--|
| 1. Of the earliest variety of Norman.                      | Abbot Simeon's work in the transepts up to the triforium level.  |
| 2. Of the more advanced, but yet early Norman.             | The upper stages of the transepts.   |
| 3. Of the yet more advanced Norman.                        | The nave with its splendid doorways to cloister.   |
| 4. Of a further advance, showing great richness of detail. | The lower stages of the western transept.  |
| 5. Of the latest and most refined Norman.                  | The exquisite remains of the infirmary.  |
| 6. Of the Transition.                                      | The upper stage of the west transept and the western tower.  |
| 7. Of perfected Early English.                             | The western porch and the six bays of the presbytery.  |
| 8. Of later date with early tracery.                       | The eastern chapels of the south transept (now the library), also the relics of the refectory.   |
| 9. Of perfected early Decorated.                           | The canopy of Bishop de Ludas's tomb.  |
| 10. Of late Decorated.                                     | The central octagon and the three eastern bays adjoining. The lady chapel, Prior Cawdon's chapel, &c., also later specimens in the inserted windows in the aisles of presbytery. |
| 11. Of Perpendicular.                                      | Several tombs. The chapel of Bishop Alcock. Many insertions throughout the building.   |
| 12. Of Perpendicular verging into Renaissance.             | Bishop West's chapel.  |

### THE HELLENIC SOCIETY.

ON Monday the second general meeting of the session of the Hellenic Society was held. Mr. Talfourd Ely presided. Two papers were read by Professor Percy Gardner on "A Stone Tripod at Oxford" and "The Mantinea Basis." In his first paper, the Professor said that the tripod was the gift of Mr. Lefroy, and on the stone was an inscription to the effect that the tripod was dedicated to the mother of the gods and came from Corinth. Round the pedestal were figures of three women, each wearing a long chiton. There was, as we know, a temple to the mother of the gods at Corinth, but in his opinion it was hardly likely that the tripod came from that temple. A tripod of a not dissimilar character had been found at Olympia, of which Dr. Treu had effected a most successful restoration, and others had been found at Delphi, and others again were to be seen in the Central Museum in Athens. Figures of three women were of common occurrence—as in the

threefold representation of Hecate and the three graves. In his opinion no real cultus was indicated by the tripod, which was of a purely architectonic character. The work was probably an original of the earlier part of the fifth century. If it was a copy it was a remarkably faithful one, in marked contrast to the superficiality of Roman work.

Professor Waldstein also thought that the work was not later than the middle of the fifth century. But the original, of which he believed this to be a copy, took us back to a remote antiquity. The Olympia tripod was more archaic than that at Oxford, which reminded one of the specimens of Ionic art at Athens.

Professor Ernest Gardner thought this was a specimen of the transition period between Oriental and later art, and that the purpose was purely architectonic.

Miss Harrison could not accept the view that the work had no religious or mythological significance. The number 3 pointed to the Muses or some group of goddesses. The number 9 was by no means indissolubly connected with the Muses; but the number varied, always being, however, a multiple of 3.

In his second paper, Professor Gardner said that Professor Overbeck in his "Geschichte der Plastik" had recanted his former opinion and assigned as the date of the vase at Mantinea about 370 B.C. In the midst of the basis were figures of Apollo and Marsyas, and on either side three female figures, as to which there had been considerable controversy. Furtwängler attributed the group to the later Praxiteles, but whether or not there were two artists of that name was a question involved in considerable doubt. He was not able to accept the theory of Dr. Waldstein that there had originally been four slabs, of which one had been lost. The side slabs might be Leto and her children and a group of three Muses, and with respect to the latter he was glad to be fortified by the observations of Miss Harrison.

Professor Waldstein adhered to his opinion that there had originally been four slabs, as in its present condition the work was far too symmetrical for Greek art. As to the Muses, there had always been nine of them from the days of Homer and Hesiod.

### A CANADIAN VIEW OF THE STYLE OF THE FUTURE.\*

IT is now some 350 years since the last living style of architecture reached its culminating point and began to fall away into decadence. These last three and a half centuries have been in some respects the richest in the world's history. Greater progress has been made in discovery and invention in every department of science during these three and a half centuries than had been made in the preceding thirty centuries. And yet, strange to say, during this last period—which has been so fruitful in the advancement of science—there has nowhere been in existence a true living style of architecture; while during the whole time that elapsed from the earliest dawn of the art to the beginning of this period there has never been a time when there was not being practised somewhere in the world a living and growing style.

This fact, however, is sometimes stated in such an exaggerated form as to lead to the very erroneous conclusion that nothing worthy of the name of architecture has been done since the middle of the sixteenth century, and that everything that was done before that time was good, and everything that has been done since must necessarily be bad. This is far from being the case. But critics seem often to lose their critical faculty when they are dealing with old work, and speak of it reverently and almost with bated breath, merely because it is old. This spirit sometimes leads them to profess admiration for examples of old work which, if they were the work of modern architects, these same critics would at once condemn and hold up to ridicule. There has been a vast amount of architecture produced during this last period, and much of it has been good and some of it excellent. Nearly the whole of the architecture of the Renaissance belongs to this period.

But while this is true it is also true that there is a radical distinction between architecture which is living and that which is not living. A living style contains within itself the elements of growth along the same lines on which it has arisen. As new conditions arise and new problems present themselves, new forms are evolved by a natural process of development from within. This process goes on slowly and gradually. There may be no apparent break in continuity and no abrupt step anywhere visible, and yet it is found that after the lapse of a certain time the style has wholly changed. In short, a new style has been invented. But after a style has ceased to be a living one such growth as this never takes place. Its features and forms may indeed be used with academic correctness, and may be adapted to new situations and purposes. As a new need arises another old feature will be taken and ingeniously made to serve the new purpose. But a style may be made use

\* A paper read by Mr. D. B. Dick at the annual convention of the Ontario Association of Architects.

of in this way for an indefinite length of time without making any advance beyond the point which it had attained while it was still living and growing, because this method is simply imitative and eclectic.

At this point the question, "What is style?" seems naturally to arise. Very few writers have made any attempt to give an explicit definition of the term, but have contented themselves with recounting the history and describing the features of the various styles and pointing out the differences between one and another. Such definitions as have been made are more or less unsatisfactory and may convey different meanings to different minds according to their individual predilections and the character of the architectural objects with which they are familiar. Owen Jones, for instance, says in his preface to the "Grammar of Ornament," "Architecture is the natural expression of the wants, the faculties and the sentiments of the age in which it was created." "Style in architecture is the peculiar form that expression takes under the influence of climate and materials at command." Both these statements are true so far as they go, but as definitions they do not appear on one hand to cover the whole ground, and on the other they seem to claim almost too much. Here is an attempt at another definition:—"Style in architecture consists in the harmonious working out of the construction and ornamentation in a manner so characteristic that the period and locality of the erection of original examples can be determined (by comparison) from the evidence which they themselves furnish."

All true styles will be found to fill these conditions, no matter how much they may differ from each other either in method of construction or character of ornamentation. The number of true styles into which the architecture of the world may be classified is wonderfully small considering the length of time over which they extend, and the variety of conditions under which they were produced—conditions varying with the purposes of particular buildings, with difference of materials, of mechanical skill, of climate, and of those peculiar qualities of mind in the builders which go to form what is called the genius of a people.

The first beginnings of architectural design were the fruits of a desire to hand down the memory of some great event or personage to future generations. The next were inspired by man's religious instincts, and it was only after architectural ideas had become somewhat crystallised by practice in these two directions that they began to be applied to buildings of a purely utilitarian character. It would take too long, and it is not necessary for the present purpose, to trace in detail the evolutionary process by which each style advanced to its highest perfection, only to be gradually changed into something altogether different. But this point may be noted in passing, that the change from one style to another was always the result of the introduction of new factors, such as a change in structural methods caused by the attempt to solve new problems or supply new needs, never from a mere desire to change the fashion of the external form in which architectural ideas were expressed. The most potent of these factors have been the general use of the arch by the Romans, the development of groined vaulting by the Gothic architects, and possibly the use of the truss. A couple roof and a simple barrel vault both require a straight wall for their support, with only this difference, that unless the vault is tied in so as to take the lateral thrust off the walls, they must be made much thicker to resist that thrust than would be necessary to carry the couple roof. But as soon as the principle of groining or trussing comes into play the continuous wall necessarily changes its character and becomes a series of strong supporting points with a comparatively light enclosing wall or screen between them. In the case of the highest development of this idea—the Gothic cathedral—the enclosure becomes a mere frame of stonework for the display of the largest possible quantity of painted glass. In effect the side wall is cut into sections which are turned round at right angles and so developed into buttress and flying buttress and pinnacle. This is but one illustration of the principle upon which all true development has taken place.

Two important elements in the formation or modification of style have invariably been materials and climate. The Egyptian and Grecian styles could never have been developed except in a country capable of supplying very large blocks of excellent stone. Nor could the type of dwelling-house found in Pompeii, with its shady open-air features, so suitable to the south of Italy, ever have come into general use in the climate of the northern parts of Europe.

The course of the historical development of style has been along certain well defined channels or main arteries. There have been many offshoots and possibly some indigenous styles, but these may all be left out of account because they have had no influence upon the general historic sequence of styles. This sequence includes the Egyptian, the Assyrian, the Greek, the Roman, the Byzantine and the Gothic. No style outside of these can be said to have had any influence in forming the great historic chain of styles.

One or other of two great principles of construction will be

found to be the ruling idea in the formation of every style. And the distinction between these two is so great that it is a question whether it would not be proper to say that there are only two great styles, and that all others are only subdivisions of them. The one of these great root principles is that of the pillar and beam, and the other that of the arch. All before the Roman period belong to the one style, and the Roman and all that come after it to the other. For although the principle of the arch was undoubtedly known long before the Roman period, it was the Romans who first used it as the leading principle of their construction.

Disregarding the intermediate links connecting the different styles, and considering only the most characteristic examples of each, their remarkable dissimilarity is much more obvious than their resemblance. It requires some consideration to realise, for instance, that the church of Sta Sophia is the direct descendant of the Parthenon, the Pantheon at Rome of the Hippostyle Hall at Karnak, and Salisbury Cathedral of them all. But since it is so, it is natural to expect that all these different styles should contain some elements in common. It might even be expected that the elements of which they are composed would be the same in all cases, although used in entirely different ways, just as the type in a fount may set up at one time the text of Herbert Spencer's philosophy, and at another the wit and humour of *Punch*, or a work in the English language one day and one in French or Italian the next. These elements are of two kinds, the constructive and the decorative. The essential constructive elements are very few in number. All that are absolutely necessary to constitute a building are some sort of enclosure, a means of entrance, and in most cases a roof. The constructive elements, then, are walls, piers or columns, and a roof, composed either of lintels, vaulting, or trussed work, the choice between the three perpendicular or supporting elements being most frequently determined by the principle of construction of the roof to be carried by them. The decorative elements are more numerous and complex, although wonderfully simple after all. Mouldings are the most universally used of all decorative forms, and these, no matter where or in what style they may occur, consist invariably of one or more of four simple elements used either singly or in combination. These simple elements are the ovolo, the hollow, the bead or roll, and the fillet. The ogee is only a combination of the quarter round and the hollow, and the scotia is only two hollows of different sizes contrasted. The fillet may be used either with its face set perpendicularly or at an angle, in which latter position it suggests the chamfer, which may therefore be reckoned as merely a modification of the fillet and not an independent element. There is absolutely no moulding or combination of mouldings in any style that has ever been invented that is not made out of these rudimentary elements. The possible number of combinations of these simple elements is practically inexhaustible, through the mere variation of the order of their juxtaposition and their relative sizes. When to this is added the variety obtained by modifications of their profiles the possibilities become infinite. Compare the crude simplicity of the Roman ogee or ovolo with the subtle refinement of the Greek and the difference is at once apparent, and yet they are essentially the same. There is a great difference in the effect of the ordinary attic base and the common Early English one, which consists of a small roll at the top and a large one at the bottom with a hollow and fillet between, and yet the chief difference between them is the omission in the Gothic base of a couple of fillets. The Greeks sometimes combined their elements in such a way as to produce undercut mouldings, and the Gothic architects afterwards seized hold of this idea and used it with wonderful effect in composing their groups of mouldings. But an analysis of the most elaborate groups invariably shows that they are composed of the same simple elements. The desire to produce richer effects than could be obtained by simple mouldings led to the enrichment of their surfaces and so to the use of decorative carving. Sculpture also appears from very early times to have been associated with architecture as a decorative accessory. And the character of the carving and the sculpture varied in different styles, and, taken in conjunction with the mouldings, contributed largely to their individuality.

All architecture, then, is composed of the same elements. But there is a radical difference between the principles on which these elements were used up to the sixteenth century and those on which they have been used since. In the old method they were used as the words by which expression was given to those new thoughts which were ever contributing to the building up of the body of true architecture. In the modern method the thoughts themselves are appropriated and combined and arranged to make up the eclectic architecture of modern times.

That eclecticism is the ruling motive of modern architecture may be considered as an accepted fact. All the so-called "Revivals" have been nothing but eclecticism. The advance of science and the increased complexity of modern life have constantly raised new problems from the solution of which some tendency at least towards a new style might reasonably have

been expected. Engineering and all the other sciences have kept fully abreast of these new demands, and have often created new wants by offering the means of satisfying them. Architecture alone has failed to rise to the occasion. It is not to be denied that in some respects architecture has advanced even within the last generation, but there has been no change of principle, and the improvement has been rather in taste than method.

The chief factors in the creation of these modern opportunities have been the increase in knowledge of the properties and strength of materials and of the principles of framing, and the improvements in the manufacture of iron and steel and of glass. The building of the Crystal Palace by Sir Joseph Paxton, about the middle of this century, gave a great impetus to the use of iron, and the iron front became the new idea. Fortunately it had not vitality enough to live very long. Had the designers been able to divest their minds of the old ideas they might perhaps have made something of the new one. But instead of this they simply took the old forms of a stone construction and tried to adapt them to the new material. The result was inevitable. To save material columns and other features were attenuated to the last degree, and to save expense in modelling details were duplicated with hopeless monotony, while, worse than all perhaps, the principal idea to be kept in mind in designing or selecting the details was not "are they beautiful or appropriate?" but, "will they draw out of the mould?" Some of these attempts have been removed to make way for more modern structures, but many of them still remain and periodically challenge attention by blossoming out in a resplendent coat of new paint.

But the one great opportunity of modern times has been the advent of the steel framed structure generally spoken of as the "skyscraper." It is not yet many years since it appeared as practically a new problem; but the number of the attempts at its solution, and the vast amount of ability and skill that have been brought to bear upon these attempts, afford justification even now for an estimate of the value of the results. There is much variety among the examples, and some of them are good, some bad, and some indifferent. But however various they may be in other respects, this one thing has to be said of them all—that not one of them has contributed in the very smallest degree towards the creation of a new style. They are all shams in so far that their construction is not expressed but concealed. There is not an architectural idea in one of them that was not in current use long ago. They may be divided roughly into two classes—first, those in which the whole height is treated as one composition from which nothing can be taken away and to which nothing can be added without destroying its proportions; and, second, those which are designed on the principle of a pillar, some of the lower storeys being grouped to form the base, and some of the upper ones the capital, while the intermediate storeys form the shaft as it were. The first of these two ideas is by far the more difficult of successful accomplishment, and when it is successful the result is proportionately better than in the best of the other type. The second type is defective in that it fails to satisfy the eye that the design was made for just that number of storeys and no other. The idea is suggested that the building might be cut in two in the middle, the upper part raised, and one or more new storeys inserted. A design that conveys this impression to the mind cannot possibly have been made on true principles. The majority of the very tall buildings are also found wanting when the test of suitability of design is applied to them, because they are usually so situated that they cannot be seen except so much foreshortened that their proportions are entirely destroyed. The only appropriate place for a skyscraper is on the side of a large open square or at the end of a long street, which latter, of course, is rarely possible. It therefore carries within itself the seeds of its own destruction as an architectural idea, because its advantages depend upon its standing alone and towering over its less aspiring neighbours. A street of skyscrapers would defeat its own purposes, and a city of skyscrapers would be unfit to live in. Hence there are already signs that its day is over and that the height of street buildings will in future be generally restricted by legislative enactment. It is not wonderful that the skyscraper has done nothing towards the production of a new style nor that some of the examples have not been very happy as designs. The wonder is rather that, considering the time usually allowed for designing them, the average results have been even so good as they are. There is no need to regret that the skyscraper has done nothing towards the attainment of a new style, because it could after all have been nothing more than a style for skyscrapers, while a new style to be of any use must be one capable of universal application.

One can hardly look back over the history of the styles without asking oneself the question, Is there any reason why they should not have been developed upon other lines than those which they actually followed? If, for instance, the Roman style developed under one set of conditions into Gothic and under another into Byzantine, why might it not under a third and easily conceivable set of conditions have developed into a

third style differing from both of these as much as they do from each other? We have seen that all architecture is composed of the same essential elements. If these have been combined to form styles differing from each other as much as Egyptian and Roman or Greek and Gothic, why have they never been combined to make another different from them all? It can only be because the evolution of a style is a long, slow process, and the world was not big enough to allow of the complete separation necessary for the existence at the same time of more than one or two of the wholly different sets of conditions necessary for the evolution of distinct styles. And further, because during all the time that the old styles were in process of evolution certain social conditions favourable to the process prevailed, but have ceased in modern times to exist, and have been succeeded by others distinctly unfavourable.

In view of the fact that so few distinct styles were evolved during the past, is it possible by analysis to arrive at such a knowledge of the principles out of which they grew as to afford a hope that even yet the following out of the same principles might result in the production of a new one? We have seen that the elements of all styles are the same and are always at hand. There are men of as much talent or even genius in the world to-day as there ever were. The sister arts of painting and sculpture are as much alive to-day as they have ever been at any period in their history. Why should architecture of all the fine arts alone be dead? Is no resource left her but that of fitting together the dry bones of the dead past instead of going forward in the full exuberance of life and creating new ideas to be handed down as working material to future generations as the ideas of the past have come down from one generation to another?

The eclectic method has been tried for several centuries and has failed. Is there no other? Would it be possible by going back to first principles to design a building absolutely without style? Much has been written and spoken about "catching the spirit" of a style, but those who have succeeded best in the attempt have only succeeded in producing imitations—close enough in many cases to deceive those ignorant of the date of their erection into believing them genuine works of the style imitated. They have done absolutely nothing towards carrying the evolution of the style one iota further. There is, however, a "spirit" of design without which no good work ever has been done or ever will be done in any style. It is something akin to thinking without words. It is the creation of a design by the thoughtful working out of all the problems involved under the special conditions of the case. It is conceivable that up to a certain point a design might thus be worked out that would be structurally complete, perfect in its proportions, and yet without a trace of detail belonging to any known style—in fact, without any detail at all. One could not look at the Parthenon or Salisbury Cathedral from a distance too great to permit of any detail being visible without in some measure being conscious of the difference in the spirit of the two styles. If it were possible to work out a design, even without detail, that would not suggest the spirit of any known style, the first step would be taken towards the invention of a new one.

(To be concluded.)

#### ARCHITECTURAL CRAFTSMEN'S SOCIETY.

LAST Friday evening, under the auspices of the Glasgow and West of Scotland Technical College, Mr. Wm. U. Muir read a paper on "Foundations" before a large attendance of members. He dealt very fully with the different classes of foundations to be met with in the ordinary course of building practice, and demonstrated by means of sketches and diagrams their mode of treatment in varying circumstances. The benefit of taking borings, the necessity of draining in most cases, the uses of sand and timber piling were all explained, and a profitable discussion followed.

Mr. Muir was cordially thanked for his paper, undertaken at the last moment to fill the place of Mr. A. Lindsay Miller, who had been unable to attend.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE Association, by the kind permission of the Edinburgh School Board, visited on the 13th inst. the new school at Broughton, under the leadership of Mr. Robert Wilson, architect. The School is built upon the site of Blackfield House, and consists of a central block with a wing at each side. The central block contains the principal classrooms, entering from a combined boys' and girls' staircase, and in the wings are the teachers' private rooms and cookery and laundry classrooms. There is a total accommodation for 1,358 children, provided at a cost of about 24,000*l.*, exclusive of the site. In the basement are situated the gymnasium, swimming-bath, boiler-house and engine-room. Externally the building is a very satisfactory example of school architecture. The visit was brought to a close by a vote of thanks to Mr. Wilson for his interesting explanation.

## THE NATIONAL GALLERY.

THE following recent additions have been made to the National Gallery:—

By the bequest of Mrs. Hodgkinson, the late Sir John E. Millais's celebrated picture of *The Yeoman of the Guard*, exhibited at the Royal Academy in 1876. It is placed on a screen in Room XX.

By the gift of a body of subscribers a landscape by Giovanni Costa, exhibited last summer at the New Gallery, entitled *A View of the Carrara Mountains*.

And presented by the painter's family, a picture of *Christ and the Woman of Samaria*, painted by the late George Richmond, R.A., when he was eighteen.

These two pictures are placed in Room XXI.

Mr. J. Wolfe Barry has presented the drawing by the late E. M. Barry, R.A., which was made as a competition design for the National Gallery. This drawing is placed at the western end of the entrance-hall.

## M. MAGNE ON THE PARTHENON.

THERE has recently been published at the "Imprimerie Nationale" in Paris, under the direction of the Minister of Fine Arts, says *l'Illustration* (translated in the American *Architect*), a very interesting book containing the results of observations made by the eminent French architect, M. Magne, on the Parthenon. Two years ago, while on a journey in Greece, M. Magne called attention to the alarming condition of the edifice. The architraves were broken in places, the entablatures had been badly shaken, and it was evident that, sooner or later, the entire building must fall in pieces.

Informed by the French Government of the result of these observations, the Hellenic Government immediately submitted the question of what was to be done to a special commission, formed in part of Greeks and in part of foreigners resident in Athens. The members of the commission were unable to agree upon any plan. One of them, a German, conceived the idea of fastening together with bolts the detached fragments, and of pouring into all the cracks tons of glue. The difficulties, however, kept increasing. A slight earthquake shock had still further dislocated the entablature and had decided the fall of several fragments of the architrave. There was no time to be lost. The Grecian Government took counsel with a German architect, Herr Durm, and an English architect, Mr. Penrose, both gentlemen artists of ability and well known as archæologists. While they were on the spot studying the situation, M. Magne, at the instance of the French Minister of Fine Arts, was preparing in Paris a project for consolidation, and was drawing up a plan for the necessary supports to underpin the broken or crumbling blocks, and when he returned to Greece last spring he was able to present a model of the framework of stagings that would be indispensable to the work.

He expressed his views at a public meeting. It was a question, he believed, not of a restoration, but of preservation. There could be no question of replacing the great work of Ictinus by a modern work; that would, indeed, be a veritable sacrilege.

M. Magne found that his views were sympathized with and encouraged by his first success, he resumed his studies at the Parthenon and shortly after was able to submit to the Government of Greece a definite plan of work, which was officially adopted. A complement of French carpenters sent to Athens last summer began work at once. The scaffoldings are in place and the work is going forward with all possible carefulness.

The water-colours, photographs and drawings made of the Parthenon by M. Magne are now on exhibition at the Trocadéro Museum in Paris and, as before stated, the Government has put forth a printed report of the results of M. Magne's studies and observations. Never before has there been published such definite information concerning this marvellous structure, in which are united all the perfections of ancient art. M. Magne has not contented himself with merely describing these noble ruins and with pointing out in concise terms their beauties. He has corrected, in the course of writing his book, many errors founded upon ancient texts imperfectly understood. He has thrown entirely new light upon the system of construction of the Parthenon, upon the manner of lighting it and upon the use of colour in its decoration.

The building was divided into four parts: the vestibule, or pronaos; the sanctuary, or naos; a posterior hall, called the opisthodomos; and the opisthion, or posterior vestibule. The naos was the largest part. A gallery two storeys high, sustained by a double row of columns, surrounded it on three sides, and divided it into three naves. At the end of the central nave, which was the largest, was erected the statue of Athena.

The pronaos, from which the naos opened, was not, like the latter, enclosed by a continuous wall. It was a portico of six columns, raised two steps above the peristyle or outer colonnade which surrounded the monument. Along its exterior sides

extended the outer walls of the temple or secos, terminated by antæ.

The opisthion was identical in construction with the pronaos. It communicated by a vast doorway with the opisthodomos, where was kept the treasure of Athens. Less deep, but as wide as the naos, and like that entirely enclosed, the opisthodomos was divided into equal bays by four points of support whose trace is still marked in the flagging. In the flagging of the naos, also, were found the spots occupied by the columns of the interior gallery.

So much for the construction of the building; now as to its exterior decoration. The two triangular tympanums of the pediments had on one the birth of Athene, on the other the dispute between Athene and Poseidon; upon the metopes of the frieze the combat of the Lapithæ and the Centaurs, and the struggle of the Athenians against the Amazons. Upon the walls of the temple, under the peristyle, was a frieze on which the procession of the Panathenæa with its long cortège was unrolled. Starting at the posterior façade the procession followed in two lines the side walls of the secos, meeting at the anterior façade where a group of divinities, seated, was receiving with the consecrated robe of Athene the homage and the offerings of the multitude.

Of all this, here is what remains at the present time: the posterior part of the secos, including the opisthion with its portico and the posterior façade with its peristyle. But the fronton, since the depredations of Lord Elgin, is bereft of its principal figures, which have been carried to the British Museum. As for the anterior façade, whose fronton has also been despoiled and deprived of its bas-reliefs, it has kept the columns at the corners and in front, and its entablature; but the pronaos has only one column left; and the walls of the naos have long since crumbled. On the east and west, the façades have preserved their metopes, but in sadly mutilated condition. The metopes on the north side have partly disappeared. It is with difficulty that one can distinguish the subjects of those that remain. The best preserved of all—those on the south—have been removed and have gone to rejoin in the British Museum the Parçæ, the Iris, the Ilissus and other sculptures which were formerly the glory of the frontons. The bas-reliefs of the frieze have followed, for the most part, the same route, the only ones remaining being those on the west. The group of seated divinities has found in the Museum of the Acropolis a shelter now inviolable.

The Parthenon is erected upon a massive substructure of carefully matched rocks, rocks covered with a layer of marble, upon which rest three steps. The upper one, forming the stylobate, supports the colonnade and defines the limits of the temple. Its flagged surface measures about 69 by 30 metres.

In order to avoid the effect of concavity that so large a plane surface would have produced, the architect has given to this vast plateau a curvature visible to the naked eye. He has given it a regular curve from east to west. A similar precaution led him to curve the horizontal lines and to incline the vertical lines towards the centre. The entablature follows the curvature of the stylobate, the columns incline regularly towards the interior of the temple, and the same direction is followed by the upper courses. Thus is lost the sharpness of straight lines, and the columns do not appear overburdened by too massive and heavy frontons. At the angles a calculation of a different nature occupied the builder. In order to give to the edifice a stability not only apparent but real, he reduced the distance between the columns at the same time that he increased their diameter.

It is known that mortar was not employed by the Greeks even for temples of stone, and, indeed, not an atom of it entered into the joining of the precious materials of which the dwelling of Athena was constructed. The blocks are all cut with sharp edges and united in the same course by cramps of iron, while vertical bolts penetrating into the upper course bind them to that. In order to diminish the burden of the columns upon which, from axis to axis, the architraves extend in thick monoliths, the architect has hollowed out the frieze whose alternating metopes and triglyphs weigh heavily upon the architrave. Between the inner course around the entire circumference of the building there is an extensive passageway, large enough to give passage to a man. Above the frieze, the blocks which form the cornice, like those of the wall, are horizontally united by clasps of iron, and are also fastened by bolts to the plates of the frieze.

So much for the exterior façade. Passing beneath, we find that equal care has been bestowed upon the peristyle, with its marble ceiling and its interior porch, whose columns, unlike those of the exterior, have all the same diameter, and whose axes are in no way inclined. The proportions of the interior order are, moreover, different from the proportions of the exterior order; they are raised two steps above the flagging of the peristyle.

None of the interior divisions of the temple are remaining, but the site of the galleries which divided the naos into three naves is marked by the traces they have left in the flagging. It

is here that rests the question, so many times decided for and against, of lighting through a central opening in the naos. An examination of the flagging alone renders inadmissible the theory of this central opening. The flooring of the central nave is 4 centimetres below that of the side naves. Now there does not exist in the flagging any traces of underground canalisation; the rain water would consequently have remained here as in a cistern.

It should be remarked, moreover, that the absence of a roof would be little probable in a temple heaped with offerings and ornamented in the middle with the chryselephantine Minerva, a statue as precious from the materials employed as from the genius of Phidias, and decorated on the interior, according to all appearances, with those precious tapestries and rich Oriental stuffs so much sought for at all times by the Greeks. In order to give more weight to his argument, M. Magne strengthens it by noting illustrations borrowed as well from Egyptian architecture as from Byzantine structures. Thus, the hypostyle of the temple of Karnac was lighted only by a few narrow slits, and one sees now in St. Mark's at Venice the mosaics of the northern gallery lighted purely and simply, but sufficiently, through the bronze grille opening into it.

Let us pass to the decorations of the building. Here, again, many surprises await us. The unpublished observations that M. Magne has been able to make, thanks to the stagings which he has had erected upon the circumference of the Parthenon, permit him to assert that colour played a great rôle, a preponderant rôle. In the same way that the potter in the time of Phidias drew with a point the figures and ornaments of his vases, so at the Parthenon the decorator has marked upon the marble with a fine engraving the outlines of his ornaments. In the same way also that the potter, after having scratched his design upon the clay, coloured the figures, so in the Temple of Athena the decorator has put the ornaments in colour, after having graved them upon the marble. These colours, it is true, have disappeared almost everywhere, but there remains between the lines a brown coating of the preparation which preceded the application of colour, and to which it served without doubt as a foundation.

What were the tints employed? A comparison with the marble statues of the same epoch, all multi-coloured, permits M. Magne to respond. It is obvious, in effect, that the decorative principles by which the polychromy of statues was regulated must have equally guided the artists who coloured the ornamental parts of the temples. These statues were coloured only partially with a coloured coating. The workmen applied just enough encaustic to temper the whiteness of the marble. Thus he established between the transparent matter and the partial colouration with which he covered the face and the dress, a harmony of which the effect must have been marvellous. Following the example of the sculptor, the decorator of the Parthenon must have applied colour, not indiscriminately on all sides, but have employed it only to make the least lighted parts of the building stand out. He must have reserved its principal effects for the ceilings of the galleries and the mouldings of the frieze, or, still more, for the cornices and the mouldings of the frontons. On the exterior the columns and the architraves bear no traces of colouration, but traces of blue tints may be found in the channels of the triglyphs and of red tints on the guttæ.

The use of metals as well as of colour is apparent in the decorations. Upon the frieze of the Panathenæa numerous cylindrical holes reveal the existence of metallic ornaments applied to the sculptures—harnesses and bits, bracelets and crowns, and bronze bucklers and shields.

Such is the information given by M. Magne. One will not be astonished after learning of them at the recognition his labours have gained from the Hellenic Government, and all Frenchmen are grateful to him for this peaceful victory gained by France over a land in which the German influence has been supreme for twenty years.

### ST. PETER'S CHURCH, THANET.

SUNDAY last was fixed upon for the reopening of the chancel at St. Peter's Church, after the completion of the extensive decoration and restoration that has been carried out in commemoration of the sixty years' reign of Queen Victoria. As Canon Benham remarked in his sermon, probably in the whole history of this ancient sacred edifice—reaching back some 800 years or more—it has never presented so beautiful and finished an appearance as at the present time. In the years 1871-72 the restoration of the roof of the nave and aisles of the church was carried out as a thankoffering in connection with the recovery of the Prince of Wales from his dangerous illness; in 1887 the restoration of the tower, the recasting and rehanging of the bells (which were increased to eight), and the provision of a new clock was undertaken in commemoration of the Queen's Jubilee; and now the restoration of the chancel roof, with mosaic designs for the chancel arch and east window, in

commemoration of the Queen's Diamond Jubilee, completes the entire scheme of restoration, and is a fitting and crowning tribute of loyalty on behalf of the parishioners of St. Peter's, Thanet, to their Sovereign.

The cost of the first two commemorative schemes amounted to over 1,200*l.* each, while the cost of the work just completed is 1,020*l.*, almost the whole of which has already been provided. The following is a description of the work:—The entire length of the coved ceiling of the chancel is divided into five main bays by ribs, which retain their original vigorous colouring of alternate gold and chocolate bandings and white and black fillets; a similar rib at the ridge, with rich pendant bosses at the intersections; the deep and rich cornices at the top of the walls are also ancient, and have furnished the keynote of the decoration. The ceiling between has been covered with pitch-pine boarding, which has been slightly darkened and allowed to form the groundwork for the painted figures and the other ornamentation. The three central bays have on each side a large figure of an angel of dignified, calm and reposeful character, holding a shield bearing the monogram of Our Lord or St. Peter. These angels are the work of Miss Maud Seddon (the daughter of the architect), and are surmounted by labels inscribed "Hosannah." The easternmost bay, that over the sacrum, has on each side three smaller angels with outstretched arms, with labels over, inscribed, "Hallelujah;" and the westernmost bay, that next the nave, has on each side six half-length figures of the Apostles, seated on thrones, with gilded and diapered backgrounds. All these, together with the full-sized cartoons for the mosaic-work, are the work of Mr. Henry G. Murray. The rest of the ornamentation consists of rich stencilled borders on either side of the vertical ribs, with a triangle of floriated panels on either side of the ridge rib and on one side above the cornice, all which are the work of Mr. C. Stollé. The eastern wall of the chancel has been covered with mosaic (Rusts' glass mosaic), and has a large figure of St. Peter on one side of the east window, and on the other of St. Andrew, both under canopies; angels bearing scrolls with inscriptions fill up the spandrels above the window, and there is a similar treatment in the same material of the east wall of the nave on either side of and above the chancel arch. The whole of the work is from the designs of Mr. John P. Seddon, of 62 Albany Mansions, Albert Bridge, and has been executed by Messrs. Belham & Co., church decorators, of 155 Buckingham Palace Road, London, with the assistance of the several artists above named.

An important feature of the restoration is the magnificent marble step to the platform of altar, with its accompanying mosaic—the front step with the inscription being in one piece of Devonshire marble, the whole forming a memorial of two members of the Isacke family. To the late Capt. Isacke, another member of the same family, a new mural tablet has been erected, this being the work of Mr. T. S. Lawrence. The renovation and repolishing of the brass-work to chancel were also by Messrs. Belham.

### TESSERÆ.

#### Fitness of Students.

ONE of the very first duties, and one of the greatest difficulties that presents itself to the juvenile aspirant for distinction in art, is that of self-examination—a duty enhanced in its difficulty at a time when the reflective powers are immature and the experience limited; yet on the neglect of this self-examination much disappointment and suffering are consequent. On this depends all his future success. The student must demand of himself not merely whether he has a liking for a pursuit which forms, manipulatively considered, an agreeable pastime, but whether he is in all humility prepared to undergo those varied and complex exercises without which ordinary relatively feeble achievement is the consequence, whether he can discharge the moral obligations which his inclination for the art imposes, and whether he feels he has the mental constitution and integrity of purpose, no less than the physical determination, to overcome the mental and mechanical difficulties with which he will have to contend. The like determination of purpose which animated him in the choice of his pursuit must also animate him in the patient investigation of mind and eye and the constant exercise of hand, for their functions are inseparable, as it is in art through the exercise of the hand alone that we learn the powers and qualities of our minds. Of a former state of artistic society evidence exists to show us that a long and serious time was passed in the studio of the master, during which the pupil underwent severe and sometimes laborious duties, enjoying the advantage of such emulation as was excited by competing with a number of persons of his own age. Great, therefore, were then the modes of testing the actual qualifications of the future artist. Few of these young men, however, elevated themselves into importance,

and rare are the names that, through their works, have descended to us as authorities. This circumstance is sufficient to prove the fact of a misdirected view as much at that time as now, no less than the necessity that many rare qualities should be combined in the same individual in order to the attainment of distinction. Numerous disappointments demonstrate that the will alone forms but an inconsiderable element, if it be not accompanied by discretion and knowledge, and that until we have made some experiments and have gained some little experience, it would be well to suspend our decision on the choice of a pursuit, to succeed in which a peculiar and distinct conformation of mind is essential, or to use the language of Cicero, when speaking of the legal student, "But if he shall be altogether unfit for the profession, and wanting in sense, I will advise him to make no attempts or to turn himself to some other pursuit. For neither is he, who can do excellently, to be left destitute of encouragement from us, nor is he who can do some little to be deterred; because the former seems to me to be indicative of a sort of a divinity; the latter, either to refrain from what you cannot do extremely well, or to do what you can perform not contemptibly, is the part of a reasonable human being."

#### Relation in Art.

To the artist what is termed relation, or the power of comparison between one object and another, is like the power employed by the metaphysician in considering and comparing one idea with another, from which process the qualities of one or the other or of both are to be ascertained. Size, locality, configuration, tint and numerous other particulars come within the category of the ideas comprehended within the classification of relation, either in respect to their constituent parts or their aggregate. The powers of relation appear at the very basis of our existence. As expressive of the significance of ideas or objects in our art, it is analogous to the several degrees of comparison in grammar. Morally considered, may we not ask ourselves whether our ideas do not exist in our perceptions in certain degrees of relation? Physically, where our arts have to deal with the more tangible objects of sense, the investigation and discovery of their varied qualities establishes to our minds so many distinct degrees of relation. There is no one object that does not possess and present some degree of relation to those of its kind or others differing from it. "Our estimate of personal merit," says Gibbon, "is relative to the common faculties of mankind. The aspiring efforts of genius or virtue, either in active or speculative life, are measured not so much by their real elevation as by the height to which they ascend above the level of their age or country, and the same stature which in a people of giants would pass unnoticed must appear conspicuous in a race of pigmies." This power of relation also applies equally to things absent as to those present, for it is not absolutely necessary that the objects of comparison should both be present. Thus, in regarding the attributes of any one object, we can scarcely consider it by itself or divest our memories of all recollection of other objects of its class, when a specific difference in some particulars is certain to be perceived. Our minds may be transported from the consideration of the immediate object by the remembrance of something absent that is more or less intense in its colour, form or size. When in the Bible we read that in those days there were giants, a comparison in scale is suggested between the stature of the existing race of men and those colossal beings of a past age. Again, when the traveller says the skies of Italy are more blue than those of England, the waters of the Rhone are more blue than those of the Thames, or Mont Blanc is higher than Ben Lomond—in each of these instances he makes a comparison with only one of the objects present. Thus another result of the memory is seen conjoined with the reasoning from absent things to those immediately before the eye.

#### Italian Gothic Porches.

Italian porches are always constructed in the following manner. Two parallel and horizontal stone beams spring from the wall on each side of the door-archway. Their outward extremities rest each on a shaft, and another is in the larger specimens placed close to the wall to assist in supporting the vault. These four shafts are not necessarily alike; they are often borrowed from antique buildings, and the two foremost rest on the backs of animals, such as lions, bears or wolves. These animals are the insignia of the State, and are often represented as grasping and tearing other animals, which indicate the towns or factions with which they were at war. For example, the griffin belongs to Perugia, the wolf to Siena, and the lion to the Guelphic party. Accordingly, the doorway of the Palazzo del Publico at Perugia is decorated with a griffin tearing a wolf. Upon the beams rests a waggon-vault, forming the roof of the porch, and generally concentric with the archway. The front is finished upwards with a gable and common-slanting roof. Porches of this description with slight variations are found at St. Saba, St. Clement and St. Prassede (Rome), St. Zeno at Verona, at Monza,

the west front of Modena Cathedral, and in many other instances. The west porches of the cathedrals of Verona, Parma, Piacenza, Cremona and the south porch of Modena have two storeys. In these the lower storey is constructed as before, but its roof is finished with a horizontal floor, upon which stands another porch with a gable precisely similar to those just described. At Modena and Cremona, however, the upper porch has in front an arcade of three arches on bearing shafts instead of a single one. The south porch of Verona Cathedral, which is small and of two storeys without the intermediate floor, is a very curious specimen, and there is a large porch on the north side of S. Fermo Maggiore, Verona, which differs from these in having an arch on each side instead of the lateral stone beams. All these are plainly derived from the antique portico, which even in some cases was, like them, roofed in the central part with a waggon-vault; for example, the portico or the Pantheon. Somewhat similar porches are to be met with out of Italy, of which that of St. Trophime at Arles is a notable example. These porches in Italy are confined to the Christian Roman and Lombard styles, and never occur in the Pisan, Byzantine or Italian Gothic. Nearly allied to them are hoods, which consist of a porch-roof resting either immediately on corbels or else on shafts which are so sustained, as in the churches of S. Pietro, Martire, S. Apostoli and S. Stefano, Verona.

#### Wöhler's Law of the Strength of Materials.

As the result of a long series of experiments for the Prussian Government, A. Wöhler in 1858 first pointed out that a load much less than that necessary to cause rupture by a single application would cause rupture if repeated a sufficient number of times, and that it was not sufficient, in experiments on materials of construction, to learn only the rupturing strength for a single application of load, but that it was necessary for a safe foundation for calculation to experiment upon the resistance to stress frequently repeated. The results of his researches are embodied in the following general statement which is known as Wöhler's law:—"Rupture may be caused not only by a steady load which exceeds the carrying strength, but also by repeated application of stresses, none of which are equal to this carrying strength. The differences of these stresses are measures of the disturbance of continuity in so far as by their increase the minimum stress which is still necessary for rupture diminishes." Professor Unwin states, in reference to Wöhler's researches, that they show that the safety of a structure subjected to a varying amount of straining action depends upon the range of variation of stress to which the structure is subjected and on the number of repetitions of the change of load. It has hitherto been assumed that the safety depends only on the maximum intensity of the stress, but this must now be considered to be erroneous. Every machine subjected to a constant variation of load must be designed to resist a practically infinite number of changes of load. In order that it may do so the greatest intensity of stress must be less than that for a steady load, and less in some proportion which depends upon the amount of variation the stress undergoes in its successive changes. Weyrauch remarks upon Wöhler's law that in the general form already given it is without doubt correct, and it may even be considered as a long-known result of experience, since we continually make unconscious use of it.

#### Ancient and Modern Pictures.

There are many circumstances which favour the paintings by the old masters that are entirely separate from any merit appertaining to their respective authors; and to judge fairly of pictures recently painted, these circumstances should be known and borne in mind, or justice cannot be awarded to the genius and talent of our contemporary painters. Amateurs might discover this by a little reflection, although not practically acquainted with the arts. The great multitude, however, who visit exhibitions should be made acquainted with the facts, as it is not likely that they would ever find them out. To the public in general we then address these observations. There are certain crudities in a painting newly wrought that arise out of the very nature of oil paints, namely, from their want of time to harden. The impurities of oils and varnishes decrease as the colours become indurated, until the picture acquires a general texture of surface, which the utmost skill of the painter in laying on his colours, be they ever so purely or finely levigated, cannot at first produce. Vandyke's incomparable pictures were comparatively raw and crude when recently finished; so much so, indeed, that those who lived to a great age many years after his death expressed their surprise on beholding the change which time had wrought upon them, they being then mellowed and glowing with harmony. Having said thus much of what time will effect in favour of pictures as to improving their tones and hardening the colours, we shall add a few words on the other advantages which their compositions acquire by time, namely, those which we attach to antiquity; for there is a

charm in this, abstracted entirely from the merit of the author of a picture or a book. Costume, so main a feature of the picturesque, is always the more interesting the more remote it may be from our own times, the value of which is so well known to painter, sculptor, poet, and to the dramatic corps, that to insist upon it would be at the entire expense of good taste; for all agree in their admiration of this essential quality in composition. Hence the living artist who paints scenes from modern life, however exquisitely they may be wrought, has to contend with the prejudice in favour of old costume, and although the difficulty of surmounting this requires the utmost skill that the art is capable of, yet he is denied credit for invention, because painting and poetry, in the opinion of the world, seem to be only congenially employed when the imagination carries the genius back to portraying the customs and habits of the times past. Thus it is the costume, the buildings, the furniture, utensils, though modern in the ancient painters' day, are become ancient in our day; hence they have acquired, without any superior invention on the part of the designer, a picturesqueness of character that stamps upon them a value which modern objects, however well represented, cannot impose. No, not even if the pictorial imitation were even ten times more perfect in the new picture.

#### Silica in Stone.

Notwithstanding all the discoveries and improvements which have been made in chemical science, we are still unacquainted with the means of dissolving silica in water or other fluid, so as to imitate nature, or to show how silicious earth is produced in the animal, vegetable and mineral kingdoms. The presence of silica, completely in solution, may be detected in various mineral springs, especially if they are naturally hot or tepid, as in those at Bath, which is the more remarkable, because the Bath waters contain no alkali nor any material known to contribute to its solution. The geysers, or boiling fountains in Iceland, contain nine or ten grains of silica in every hundred cubic inches of water, from whence solid silicious matter is copiously deposited about the mouth of each fountain. A small quantity of silica is also to be met with in the hair, horns and feathers of animals; and it is secreted in larger quantities on the wings or hard shiny external casing of the numerous tribes of beetles; it is likewise deposited abundantly round the outside of cane, bamboo, straw and all the larger kinds of grasses. These facts are constantly operating in the beautiful laboratory of nature, but they, like many others, are inexplicable with our present knowledge. The elementary substances which form either chert, flint, quartz or sandstone are produced perfectly in solution, but we are ignorant of the means; neither can we discover, by any of the ordinary processes of nature, a mode of dissolving the individual grains which compose silicious rocks, their decomposition being usually effected by disintegration, or separation of the grains from each other by mechanical forces, assisted by some chemical agency.

#### Vitruvius and Josephus.

In looking at the life of Vitruvius, we see enough to render it very probable that it was in the army of Titus that he held the post of engineer, and might therefore have been present at the siege of Jerusalem. He might have had access to the sacred books then taken from the Temple. He might have been the intimate friend of Josephus when, under the favour of the same emperors who patronised him, Josephus became a denizen of Rome, entirely throwing off all the shackles of his Jewish citizenship, which had so long sat uneasily upon him. Is it not possible that they were one and the same person?—that Vitruvius was no other than the Latin name adopted by Josephus with his newly-adopted country?

#### Cathedral Illustrations.

DEAR SIR,—Will you allow me, though personally a stranger, and not even an architect, but an ardent though humble archaeologist, to express the delight with which I welcome each succeeding number of your "Cathedral Series." At the same time may I add my voice to the appeal made by Mr. Johnson and "An Old Admirer," that you would allow your illustrations at present in the letterpress to appear as separate sheets, corresponding with the full-page ones, and also, which is almost more important, would give us the letterpress distinct from the other articles? A second copy only enables us to make a patchwork and a muddle. Such a work would prove a *chef-d'œuvre* among histories of English cathedrals. I feel sure that none of us would regret or begrudge the extra cost of such a work.—I remain, dear sir, yours faithfully,  
Detling Vicarage, Maidstone. J. CAVE-BROWNE.

#### GENERAL.

**The London County Council** on Tuesday last declined to approve of the erection of a theatre at the junction of Norris Street and St. Albans Place, Haymarket, on account of the difficulty of the approaches.

**A Mosaic Pavement**, which is a rude attempt to represent a map of the country, has been discovered in a village on the east of the River Jordan, half-way between Salt and Kerak.

**A Sum** of 12,000 francs has been granted by the French Commission of Historic Monuments towards the restoration of the Roman theatre at Orange.

**The Princess's Theatre**, Oxford Street, was offered for sale by Messrs. Debenham, Tewson, Farmer & Co. on Tuesday. The property is held on a lease which expires in July 1940 at a rent of 1,600*l.* The highest bidding was 20,500*l.*, but the auctioneers said they were unable to sell the property for that sum, and it was withdrawn.

**The Committee** of the London Chamber of Commerce appointed to investigate the subject of illicit commissions having desired further evidence, many gentlemen have offered to testify to their experience.

**The Statue** of the *Chariot Driver*, found at Delphi by members of the French School at Athens, is now supposed to represent one of the kings of Cyrene, and may be the work of Amphion, the Cretan sculptor.

**A Professorship of Public Health** will shortly be established in the University of Edinburgh, as, in addition to the sum of 5,000*l.*, less legacy duty, bequeathed to the University in 1893 by the late Mr. A. L. Bruce, Edinburgh, and a further donation of 1,063*l.* for the same object from members of the family, an offer of 5,000*l.* towards the same object had been received from a gentleman whose name is not to be made known for the present.

**A Gentleman** at Southampton has offered to give 5,000*l.* towards the building of a new town-hall at Southampton in commemoration of the Queen's reign, if nineteen similar donations are made. An effort is also to be made to raise 20,000*l.* to extend the Royal South Hants Infirmary.

**Dr. A. Bredius**, the director of the Royal Gallery of Paintings in the Mauritshuis of The Hague, has sent in his resignation of his office.

**A Majority** of the inhabitants of Gravesend have declined to approve of the purchase of the waterworks, now belonging to a company.

**Mr. Hamar Bass, M.P.**, is to give 15,000*l.* for providing a church and vicarage for the district of All Saints, Burton-on-Trent, on condition that an endowment of 300*l.* per annum is raised. Towards this income Messrs. Bass, Radcliff & Gretton have promised 3,000*l.* and Lord Burton 2,000*l.* Mr. Gretton is erecting a church at a cost of 20,000*l.* at Stretton, on the outskirts of the borough; and at Horninglow, another suburb, Lord Burton has deposited 10,000*l.* for a church, on condition that a similar amount is raised for endowment.

**Mr. William Dannat**, the American painter, who resides in Paris, has been raised to the rank of officer in the Legion of Honour.

**A Site** for the Usher Hall remains undiscovered in Edinburgh. On Monday the committee of the Town Council considered several proposals, but out of them only two relating to sites near the west end of George Street were reserved for further examination.

**Sir H. Trueman Wood, M.A.**, will on Wednesday next read a paper at the meeting of the Society of Arts on "Reproduction of Colour by Photographic Methods."

**The Discussion** on Mr. J. Willis Bund's paper on "Allotments and Small Holdings" will be resumed at the meeting of the Surveyors' Institution on Monday.

**The Sanitary Institute** will, on the invitation of the City Council of Leeds, hold a sanitary congress and health exhibition in that city in the month of September next.

**The Foundations** of a tower which is supposed to have been erected by the Greeks have been discovered at Syracuse.

**A Meeting** of the Metropolitan Asylums Board was held on Saturday at which a letter was read from the Local Government Board stating that the managers were not empowered to purchase land on the Thames Embankment for offices, and that the Board could not give any consent in the absence of any statutory authority. The managers were of opinion that the absence of statutory powers to purchase a site on which to erect a building was a difficulty which ought to be remedied without delay by the introduction of a Bill into Parliament for that purpose. The Local Government Board have authorised the managers to cause an ambulance station to be erected on land adjoining the South-Western Hospital, at a cost not exceeding 14,314*l.*

## THE WEEK.

THE Frankfort Industrial Museum has obtained reproductions of the antique silver vessels which were discovered a few years ago at Bosco-Reale, near Pompeii, and which Baron EDMUND DE ROTHSCHILD purchased and presented to the Louvre. The casting was undertaken by the firm of HACK & HOURDEQUIN, of Paris. The drinking vessels are a further revelation of the luxury of Pompeii, and suggest that, as in the poems of HORACE, there was amidst all the revelry occasional recollections that, as life was very short, it was wise to enjoy the fleeting hours. A row of skeletons in relief on one of the cups might appear a grim sort of ornamentation, but to the Pompeian guests it was suggestive. The plate is unlike any known examples. For that reason the authorities of our museums will probably make no effort to secure copies of the reproductions. Having already defined the limits of ancient art, anything which casts a doubt on their infallibility is of course disagreeable to their official eyes, and if a worker in London, Birmingham, Sheffield, or Edinburgh is desirous to realise what the Bosco-Reale treasures are like he must visit Paris. That is not the only inconvenience which arises from the system by which our museums are controlled.

IN connection with the Brussels International Exhibition of this year *cortèges* are inevitable—in fact, a Flemish celebration of any kind would be considered incomplete without them. They have the advantage of uniting the past with the present, and to the people they are as interesting as any collection of historical paintings. Unfortunately, Belgium has just lost the artist who was pre-eminent in devising scenes of the kind. M. DEN DUYTS was an excellent landscape-painter, and his works might be cited by Mr. RUSKIN as expressions of the “pathetic fallacy,” but to the popular mind his living and moving *cortèges* surpassed all he attempted on canvas. He was entrusted by the Municipality with the organisation of the *cortège des cloches*, which was to be one of the attractions of the exhibition pageants, and he had prepared drawings of all the cars and groups, which were approved when death surprised him. Those who remember his *cortèges* which symbolised flowers and light can imagine what a loss will arise from the absence of DEN DUYTS. His drawings will enable others to realise his ideas, but in dealing with groups much depends on happy thoughts which do not always visit the studio, and which are rather inspired by the sight of the living statuary. However, the organisation of the various parts of the exhibition cannot be suspended because a chief has fallen. M. SAINTENOY, the architect, is more busy than ever over the pavilion which the city of Brussels is erecting, and he has the co-operation of M. BAES, the decorator. Nor are the operations confined to the exhibition grounds. The pictures in the Musée Moderne, which of late years have been often changed, are once more to have new positions assigned to them, in order that the art of to-day may impress visitors. The arrangements are entrusted to MM. CARDON and A. J. WAUTERS.

It is to be regretted the Lord Chancellor and the learned law lords in the House of Lords on Monday last could not “screw their courage to the sticking-point” by giving a decision in CHASTEY and Another *v.* ACKLAND. Perhaps it was considered the consequences would be too serious, because many people might have further inducement to become litigants. The question involved was really whether an action for interference with light and air is not altogether inadequate; graver issues which may bring far larger damages are at stake, although commonly overlooked. In these days when sanitation counts for so much, the raising of a building to a greater height may be a worse evil than the stopping up of a drain. CHASTEY and Another would agree with that view. They have a lodging-house in Exeter, and their neighbour, a dentist, having enlarged his premises, they sought damages for obstruction of ancient lights and free access of air. The case was tried before Mr. Justice CAVE at the local assizes. It was found there was an obstruction, and the damage was assessed at 10*l.* What was more important, it was likewise found that the effect of the alteration was to make the basement of the lodging-house more damp and some of the rooms less wholesome and not adapted for habitation. His lordship

accordingly granted an injunction for the pulling-down of the part of the building which caused the dampness. The defendant appealed. The Court of Appeal found for the defendant on the ground that he had not caused the nuisance, that there was no legal right to such a current of air as was sought, and if any inconvenience was suffered it was “*damnum absque injuria*.” There was no legal ground of complaint. The plaintiff in turn appealed to the House of Lords. It was suggested by their lordships that an arrangement should be come to, and accordingly the defendant agreed to pay 300*l.* instead of 10*l.* for obstruction of ancient lights, besides costs, and that any right to have the new building demolished should not be enforced. There is no actual judgment with regard to dampness and other discomforts, but plaintiffs in the future will be satisfied if they are as fortunate as CHASTEY and Another in having 10*l.* damages increased to 300*l.*

THE plans for the restoration of Malmaison, which were prepared with the aid of M. DAUMET, are now complete. The estimated cost of the works is 480,000 francs, and does not comprise the outlay on the decoration of the interior or on the gardens. M. OSIRIS, who has enriched France with so many costly memorials, intends to have the restoration scheme carried out in its integrity. Malmaison will recall associations of BONAPARTE and JOSEPHINE for many a year to come. The charge of the building will be undertaken by the Department of Fine Arts. The coming international exhibition has incited M. OSIRIS to further generosity. In 1889 he offered 100,000 francs to reward the author of the work which was considered to be most interesting as an example of art, industry, or public utility. A similar sum will be available for the exhibition of 1900, and, as in the former case, the selection will be left to the syndicate of the press.

THE late WILLIAM DAWES, of Manchester, paid a heavy penalty for being endowed with a gift of genuine humour. People who might have been his clients were afraid that “Elifer Goff” could not deal with bricks and mortar gravely, and was likely to enjoy a failure of foundations or an interference with an adjoining owner's rights as an excellent joke. The fact was Mr. DAWES was very careful with every work entrusted to him, and although he was known to be connected with theatrical enterprises he was not disposed to sacrifice convenience or economy in building to effects. His largest work is the block of Victoria Buildings. Financial causes have affected it, and on a gloomy day it is not the cheerful refuge which the designer had anticipated, but Mr. DAWES undoubtedly made the most of his opportunities, and every inch of the awkward site was utilised. He was the architect for some of the Manchester Board schools, and in one case he had to surmount unusual difficulties with the foundations. We have published several drawings of his works, including the original design for the Victoria Buildings. WILLIAM DAWES was a native of Gloucester, where he was born in 1840, but he was trained in London. In 1863 he entered into partnership in Manchester with Mr. HAYLEY. He distinguished himself in the competition for the Town Hall, and thirty years ago he was able to look forward to a prosperous career. His manners were charming, and his humour pleased rather than wounded. Even those who differed from him must regret his loss as one of the best of good fellows.

PROMPTITUDE was never better exercised in architectural affairs than when an injunction was applied for to restrain Messrs. J. ALLEN & SON, contractors, from interference with the visits of the architect, Mr. WOODWARD, to works on which the firm was engaged. The British workman is often anxious to exercise authority at all costs, and in the case in question it is the labourers who should be held responsible. But the interference has excited much indignation, and many architects will agree with Mr. T. E. KNIGHTLEY when he says:—“So far as I am concerned, in all future contracts I shall insert a heavy penalty clause with power of dismissal to meet the case, and if treated as Mr. WOODWARD has been, will refuse certificates for payments and be very guarded in the selection of those I employ.”

## CONSTRUCTIVE ASYMMETRY.

IT is not easy for anyone who has grown up among examples of the Mediæval buildings of England, France or Germany to take much delight in Italian examples of the same period. The indifference is not always to be justified. Professor WILLIS, while admitting that Gothic architecture never flourished in Italy at any time, appeals for more attention to such works as are found there on the part of Englishmen, because the doorways are very elaborate. Mr. RUSKIN also considers the sculpture is of a character which does not warrant so much neglect. Professor W. H. GOODYEAR, the American, has discovered another reason for attentive consideration of them, and one which appeals to a scientific age. He has ascertained that they are optical puzzles. Assuming his conclusions to be true, the Mediæval Italian churches would on that account be allied on one side to the Parthenon, and on the other to the iron and steel girders of the nineteenth century, which are cambered or curved in order to appear as straight to all who care to contemplate them.

We have already endeavoured to suggest the character of Professor GOODYEAR's researches. He is no speculator. Accompanied by some trained pupils, he has scrutinised Italian buildings. But he has not trusted to the eyes of the party for discoveries or for tests of observations. Scientific instruments, including levels and theodolites, were used, and photographs were prepared under conditions which made them become trustworthy evidence. Yet the Professor has sometimes to acknowledge that some of his discoveries are due to chance.

In the latest instalment of his work which has appeared in the *Architectural Record* of New York, Professor GOODYEAR describes some of the phenomena relating to "constructive asymmetry" which he has met with. Symmetry in architecture is a wide subject, and it is not easy to define in what it must consist. Greek temples and some buildings of the Italian Renaissance are symmetrical, for if an axis be supposed to pass vertically through a middle point, the parts on either side are found to correspond. But the Gothic buildings of the North do not display much respect for the principle in the minds of the designers, and to some extent in later Flemish and modern Queen Anne buildings deviations from symmetry are manifest. It might, therefore, be allowed that Italian Mediæval churches should occasionally neglect a rigid balance of parts without exciting much attention.

In fact, the majority of foreign visitors to Italian churches have not searched for deviations. It was assumed that the early practice of utilising shafts and capitals and other portions of old buildings must inevitably give rise to irregularities, and that the effect of the practice would be more or less indifference to an exact disposition of new buildings. Moreover, it was remembered that Gothic was a foreign style to the Italians, and it was not difficult for them to assume that one of the Mediæval characteristics was a disregard of law and order. Englishmen in the eighteenth century would support that opinion by referring to their own glorious cathedrals as if they were architectural aberrations, and Italians might be excused for anticipating the notions of our most refined arbiters on subjects in which taste was concerned.

It would, however, be agreed that, speaking generally, there was a respect not only for right lines, but for right angles among the English Mediæval buildings. Occasionally there might be a deflection of the choir which was supposed to be a symbolic arrangement in keeping with some other peculiarities of a building. But unless in those cases, and some few where new work was introduced among old work, it was assumed that the right angle was to prevail in all buildings. In the examples selected by Professor GOODYEAR there appears, at first sight of the plans, as much deviation as we should expect if the buildings were constructed of undried bricks and were allowed to follow any direction which the heat of the sun might impose on them. Or we might suppose, the main lines of the buildings were set out by men whose vision was defective, and who could not understand in practice the value of a right angle.

We can only refer to a few of the more striking obliquities which are cited by Professor GOODYEAR. In the church of S. Nicola, Barri, if a line be drawn from a

central point and normal to the façade, it will not coincide with the centre line of the church. Although the sides do not follow the normal lines at right angles to the façade, they are parallel. Again, opposite columns are not always in the same plane; a bay on the left side is 24.45 feet, whilst the corresponding bay on the right side is 21.85 feet, and in the bays nearest the entrance there is a difference of a foot in width. In the cathedral of Ruvo there is a deviation of 8 feet between the centre line and the normal line, or in other words the side walls form an angle of 85 deg. with the façade, instead of 90 deg. No less remarkable are the plans of S. Bartolomeo, Rome; S. Giovanni in Zoccoli, Viterbo; the cathedral of Orvieto, the cathedral of Cremona, S. Maria Toscanella; the cathedral of Troja, &c. As an explanation of the phenomena, Professor GOODYEAR offers the following remarks:—

All of the Italian ground-plans which have oblique exterior walls have interior obliquities in the lines of nave and aisles. In most cases there is a slight spread in the lines of the nave and a slight convergence of the lines of the aisles in the direction toward the choir. The purpose seems to have been an avoidance of mathematically parallel lines, with a view to an increase of picturesque effect. From the standpoint of purely perspective effect there are contradictory appearances in all uses of converging lines in plan, and this is probably why the convergence of church walls toward the choir had no wide application. (About six cases are known to me in Italy.) If the lines of a nave converge in plan toward the choir and the arches do not drop correspondingly, the effect of the arches contradicts that of the lines in plan. If both devices are employed at once, detection of the trick is generally easy. (I do not know of any Mediæval Italian church in which both schemes were employed, but it was the method of Bernini in the Scala Regia of the Vatican.) On the other hand, if the lines of the nave diverge to the choir there is an increase of perspective effect as regards the lines of arches, which are thrown into more pronounced appearance of recession, although the lines in plan contradict the natural effect of perspective. Mystification of the eye, as distinct from direct increment of dimension, seems to have been the purpose of most cases of constructed asymmetry in the plans of Italian churches. For all the cases of the oblique plans taken collectively it is a point that our survey has found no churches in which both walls make an obtuse angle with the façade. The fact that the walls are always oblique in one direction is a strong argument in favour of design. Explanations based on local causes are out of the question, in view of the number of examples (about thirty-five cases), and this possibility has, moreover, always received careful attention from our survey in face of the monuments, but without finding anything in its favour as a universal or general explanation.

It is possible that the deviations from lines which show respect for regular forms may be due to peculiarities of Italian lighting. Some of the northern architects must have known about the Italian practice, but they do not appear to have systematically imitated it. What is remarkable is that there seems to be no reference to the subject in Italian books on architecture, and therefore no explanation of peculiarities which should be the more remarkable because they were not generally adopted. If it were necessary to mystify the eye in some cases, what were the conditions which imposed the effort; and, if the ruse succeeded, why was it restricted to a few buildings?

Assuming symmetry to signify a correspondence between parts which have relation to the same axes or lines, it must follow that exactness in the bays of a church having a nave and aisles should be observed. But we cannot always expect mathematical exactness at the present day, and it could hardly be attainable in days when instruments were less perfect than those in use. In S. Pietro Toscanella, it is discovered that while the bays in the nave on the Gospel side are 13.55, 15.70, 15.10 and 14.80 feet, those on the Epistle or right side are respectively 13.70, 15.95, 15.05 and 15.05 feet. The largest difference is only about 3 inches, and that might arise, as we have said, from careless setting-out. "Fudging" was likely to be familiar to the Italian builders as a way of evading the consequences of a blunder. It happens in the same church that the capitals which are not uniform in size or style are "arranged in corresponding pairs on the two sides of the nave, so that two Ionic capitals, two Corinthian capitals, and two Mediæval capitals, of similar though not identical design, are brought to face one another." The spacing might to some extent have been determined by the aid of the capitals as standards rather than by the axes of the columns. What, however, is not explained by Professor GOODYEAR is the law of optics which is subserved by the irregularity of the bays on either side of the nave. He says that "evasions of regularity

were practised from a definite artistic feeling and purpose, and generally without the design of obtaining an effect of dimension by palpable trickery ;" but how by means of evasions artistic effect was gained is by no means clear. Professor GOODYEAR adds :—" It is not necessary to assert that a special theory was present to the minds of the Italian Romanesque builders in the matter of every intentional irregularity ; but it is clear that their ideal of art was to make every part of a building interesting to the eye, by giving to every part some subtle variety of form and aspect."

The subject is not only curious, but tantalising. It was only after the entasis of Greek columns had been ascertained by actual measurements that a statement of VITRUVIUS was accepted as proof of his familiarity with such a way of producing effect. Whether he was acquainted with the method of substituting curved for straight lines in other parts of a Greek building is uncertain. With that precedent before us, we might suppose it was not strange that the Renaissance writers on architecture neglected to expound all the illusions which were practised in building. Moreover, the study of the subject can only be said to have commenced, and in many later buildings we may yet discover that the practice was followed. But while admitting so much, it must be considered remarkable that deviation from horizontality, symmetry and regularity should be a commonplace occurrence in Italian practice, and yet that it should be abandoned without any valid reason, and afterwards be ignored by all men, while the reasons for its adoption remain among the mysteries that are not to be revealed.

## ELECTRICAL INSTALLATIONS.

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Continued from last week.)

### ACCUMULATORS.

THE advantages of using accumulators have already been casually mentioned, and they should be used wherever possible with private-house plants. They insure a steady light, and make it available at all hours without having to run the engine continuously.

*Theory.*—The action of an accumulator is purely chemical. It does not store or accumulate electricity as the name implies, and which is the general impression, but it stores or accumulates energy. It has been found that every unit of electricity has its equivalent of chemical energy, as it also has its mechanical equivalent. If a current is passed through an electrolyte there is a back pressure exerted, and the energy required to force the current through the cell is an exact measure of the chemical work done. If a current of electricity is passed through two platinum plates in acidulated water, the water is decomposed and the oxygen is given off at the plate where the current enters the electrolyte (the positive), and the hydrogen is given off at the other plate (the negative). The amount of work done in the cell is the amount of energy required to split up the water. If this gas is collected in finely divided platinum it will give out an equal current in the opposite direction for very nearly the same time, which would do the same amount of work (nearly) as that which was done in splitting up the water. This is the elementary theory of an accumulator. In practice the finely-divided or spongy platinum accumulator is impracticable, and other means are used for storing the energy. The lead accumulator is the one used most frequently instead of platinum, and the oxygen is not given off, but attacks the lead of the positive plate or anode, forming lead peroxide. The hydrogen is given off at the negative plate or cathode. When the cell is reversed, i.e. the positive plate made negative, the hydrogen is not given off, but attacks the lead peroxide and reduces it to spongy lead, and the oxygen attacks the positive plate as before.

When working, and the cells are discharged, both plates are partially converted into sulphate, especially the positive, and, if the cell is discharged very rapidly, the negative is partly converted into peroxide.

When the cell is charged the positive is converted from lead sulphate into peroxide, and the negative from lead sulphate to spongy lead.

The positive plate has always a considerable quantity

of peroxide, and the negative has spongy lead mixed with the sulphate, and this allows the current to flow, as the sulphate is non-conducting. When the cell is habitually over-discharged the coating of sulphate becomes complete over patches of the surface of the plate and the cell apparently loses its capacity.

*Construction.*—There are many ways of forming and many methods of constructing plates, and especially the positives. The method of forming the plates direct from the lead is the one developed by PLANTÉ, and this class is at present the most common. The Faure type of plate is pasted with red lead. When this type of plate is immersed in sulphuric acid it converts the red lead into lead peroxide, lead sulphate and water.

There is a great saving in current and time for forming with this type of plate, but notwithstanding specially shaped lead grids, &c., the paste does not adhere to the plate as well as if it is formed directly from the grid itself.

There have been several attempts to keep the paste on to the grid by mechanical means (chiefly outside pressure). The I.E.S. plate is one example of this. This plate, which is somewhat similar to the Tommasi, consists of a very light grid with vertical bars only ; the plate is compressed on this grid (there being horizontal pieces of an insulating material to form a support for the paste), and the whole is then pressed tightly into a bag of perforated celluloid. The celluloid bag, it is claimed, prevents the paste from detaching itself or from being washed off ; but this latter will only occur when batteries are used for traction purposes, falling to the bottom and short-circuiting the plates.

There are very many other devices analogous to this for keeping the paste in its place, such as the placing of asbestos fibre, perforated ebonite, celluloid, &c., between the plates ; but it may be said of all these that when the paste is detached it does not matter whether it falls or not, it is then worse than useless, as there is a bad contact between it and the grids. For private plants there is no need for these devices, as the battery is not subjected to vibration, washing, &c., and their use prevents a proper examination of the condition of the cells.

*Erection.*—It is necessary that a storage battery be used carefully, and if the attendant has not a proper knowledge of the subject, it will be advisable to have the battery inspected at regular intervals by an expert. A very good plan is to arrange with the manufacturers of the battery to maintain it on a contract. Many firms offer to do this, and if reasonable terms can be arranged it will be the most satisfactory.

The battery-room should be completely isolated from the machinery, or in fact, any other portion of the building, and be well ventilated. Heating apparatus (preferably hot-water pipes) must be provided and the temperature must never be allowed to fall to freezing, as the plates often lose their capacity if this happens. The room must be lighted by means of incandescent lamps (not arcs) and no naked lights should be allowed. The hydrogen gas which is given off when the battery is nearly charged has been known to explode ; but a very small amount of foresight and care will prevent any possibility of this.

The connections between the cells should be burned together, not made by brass nuts and bolts, and the attendant should be instructed how to do this. The work is rather more difficult than soldering, but proficiency can soon be obtained. If a cell has to be removed the lugs are sawn through and reburnt when the cell is replaced. The brass nuts and bolts frequently used for connecting cells are often dropped into the cells ; if so they corrode, and a very little copper in the cells will spoil the negative plates.

The makers supply full directions as to fixing, and these must be rigidly carried out.

### THE WORKING OF ACCUMULATORS

When the accumulators are set up and the maker's instructions with reference to the first charge have been carried out, the voltage of each individual cell should be tested, after the battery has been standing some hours. The cells should be tested with a low-reading voltmeter, and the E.M.F. of each should be at least 2.1 volts. If this is not the case the cell should be examined for short circuits, &c., and if needed should be charged up again.

A hydrometer should be placed in each of the regulation or end cells, and one or two in the rest of the battery. The specific gravity of the acid recommended varies with different kinds of cells, but the usual is 1.20 when fully charged, and 1.19 when discharged. The hydrometers should have a distinctive mark on the stem, which shows whether the cells are charged or not at a glance. The hydrometer cannot always be relied upon as a certain indicator, and a cell-testing voltmeter should be used occasionally.

The chief difficulties met with are (1) sulphating; (2) buckling; (3) short circuiting by mud shed from the plates (positive usually); (4) mysterious loss of capacity.

*Sulphating.*—The sign of sulphating is the appearance of white patches on the plates, which usually spread rapidly, especially on the positives. This is due to over-discharging, either at too high a rate or for too long a time.

The only satisfactory way of reducing this sulphate is to overcharge the cells, *i.e.* keep them gassing for several hours before discharging, and then discharge at a very low rate, and stop before the cells are fully discharged. Several charges and discharges on this plan will usually convert the sulphate into peroxide and spongy lead. The apparent result of sulphating is loss of capacity, which is caused by the non-conducting layer of sulphate preventing the necessary reaction between the electrolyte and the electrodes.

*Buckling.*—This is due to unequal expansion of the positive plates. It is a well-known fact that the plates expand and contract when used, and if one part of the plate is charged or discharged more than the other, due to many causes, usually sulphating, the plate expands and contracts unevenly and buckles.

For this reason it is impossible to make large plates work satisfactorily. When a plate once buckles, the buckled plate approaches the adjoining one, takes more than its share of the current, and the buckling becomes worse. If cells are discharged at too high a rate they will buckle, and there is no permanent remedy to prevent this recurring. Buckling can be prevented in the design of the plate, but the subject is too large a one to enter into here. The smaller the plate the less is the buckling, and a plate built up of a number of small elements is better (from this point of view) than a large solid one.

*Shedding of Active Material.*—This fault occurs in all cells without distinction, and is at present unpreventable, and when the material is once detached there is no means of replacing it. It is better to allow it to fall than to try to keep it in position by mechanical means. Molecular forces cannot be resisted successfully by means of perforated celluloid and the like.

To prevent short-circuiting a space of at least 2 to 3 inches must be allowed between the bottom of the plates and cell. If this is done the cell will need cleaning out at long intervals only.

*Loss of Capacity.*—Although great attention has been given to the positive plate in a cell the negative is the one which is most hopeless to deal with if anything goes wrong. Negatives lose their capacity in a, to the user, most mysterious manner.

There is a belief that a fall of temperature to below freezing causes a permanent loss of capacity of from 25 to 33 per cent. Whether this is true or not it is difficult to say, but there seems to be no satisfactory reason for such a result.

Loss of capacity in the negatives is usually, and, in fact, nearly always due to impurities in the lead or acid. The difficulty is that in the negative plate the conditions are those of reduction, and the tendency is to keep the impurities in the metallic condition. The only way to clean out the metallic impurities is to reverse the plates by charging them up with sheets of lead as the negatives, *i.e.* make the negative positive. The impurities become dissolved in the acid or deposited on the dummy plate, as all the oxides and sulphates of common metals (except lead) are soluble in dilute acid. The electrolyte should then be poured away, the plates reversed back again, and recharged with the original positives in fresh electrolyte. The cell will then most probably work satisfactorily. This should not be attempted without the advice of the makers, or an expert on accumulators, as the operation requires great care, and the cell may be ruined by injudicious treatment that is caused by want of knowledge.

It must not be imagined that the above formidable list of disorders to which lead accumulators are liable makes them useless for practical work.

If reasonable care is exercised and a good accumulator of the proper size for the work is selected, very few or none of the troubles, except the shedding of the active material, will be experienced. In a Plante cell the shedding of the active material makes little or no difference to its capacity. The grid or support is left thick enough to enable it to be acted upon and fresh material to be formed out of it for many years, and the battery should become more and more efficient (as regards weight and capacity) until the positives are all peroxide, and then they will fall to pieces.

A battery, like everything else, wears out in time, but it will save many times more during its life than it costs to keep it going.

My thanks are due to Mr. W. FENNELL (one of my assistants) for the help given in my endeavour to prepare this article in a simple manner without going too deeply into the subject.

## THE SOCIETY OF ARCHITECTS.

THE annual dinner of the Society of Architects was held on Tuesday evening last at the Hôtel Cecil. The president, Mr. Robert Walker, J.P., occupied the chair, and he was supported by the Bishop of Stepney, Mr. Wyke Bayliss, Judge Emden, Mr. J. A. Rentoul, Q.C., M.P., Mr. A. A. Hudson, Professor Banister Fletcher, Mr. G. Candy, Q.C., Mr. W. H. C. Payne, Mr. R. Roberts, J.P., Mr. G. Highton, Mr. Edgar Farman, Mr. S. W. Thompson, Mr. H. Lovegrove, Mr. Walter Emden and Mr. Ellis Marsland, hon. secretary, and among the guests present were Mr. G. A. T. Middleton, Mr. S. Trevail, Mr. W. Woodward, Mr. Williams, Mr. O. Marsland, Mr. S. Marsland, Mr. Drysdale, Mr. Hills, Mr. Coyle, Mr. Bennett, Mr. Slater, Mr. Andrew, Mr. West, Mr. Perkin, Mr. Bull, Mr. Jackson, Mr. Finch, Major F. S. Leslie, R.E., Mr. Richards, Mr. Kingerlee, Mr. Welman, Mr. Burgess, Mr. Tucker, Mr. McDermitt, the Rev. A. Mercer, Mr. Ferguson, Mr. James, Mr. Manning, Mr. Hawes, Mr. Corby, Mr. Condry, Mr. Wallace, Mr. Warren, Mr. Devill, Mr. Dick, Mr. H. G. Quartermain, Mr. Elliott, Mr. A. I. Quartermain, Mr. Tarte, Mr. Alderman Skinner, Mr. Scott, Mr. Bond, Mr. Johnson, Mr. Day, Mr. Chart, Mr. Slater, Mr. Hardman, Mr. Dunford, Mr. Boyer, Mr. G. Haslam and Mr. M. Baldwin, M.A., secretary.

After the toast of "The Queen," Mr. Walter Emden, J.P., proposed "The Houses of Parliament." They had an example in the House of Lords of what an untrammelled State could do, and the House of Commons deserved the credit and reputation of being the finest Parliament in the world.

Mr. Rentoul, M.P., who responded, said he had replied to the same toast some years ago. It was unwise to discuss politics before such a gathering, where men of different parties were assembled. He thanked them all for the emphatic way in which they had toasted the Houses of Parliament. He was among those Conservatives who liked Radical opposition to the House of Lords. The last time the Radical party came into power, one of their first acts was to recushion the seats of the House of Lords, and their last was to create a number of new peers. The House of Commons consisted, he said, of 103 Irish members, and some other persons of more or less importance, and as long as Englishmen and Scotsmen were content to allow his fellow countrymen to absorb two-thirds of the time of the House, he thought his compatriots would be perfectly satisfied.

The toast of "The Clergy" was proposed by the President, who thought it was one that specially commended itself to the Society.

The Bishop of Stepney in responding drew attention to the very strong hold religion had on Englishmen, Scotsmen and Irishmen. If he spoke of the clergy with modesty he would say that as a body they did their work as well as the buildings designed by architects would allow them. As far as the churches were concerned he thought too much expense was wasted on the external effect, whereas foreigners very sensibly looked to the interior for effect. Ravenna was an instance of a poor external appearance but magnificent inside.

In proposing the toast of "The London County Council" Mr. A. A. Hudson said the toast should commend itself to architects. Apart from the promotion of the Metropolitan Building Act the County Council had created a tribunal for the judging of building disputes. Hitherto these actions had been treated as not worthy of a higher Court, but they ought to have a fair tribunal and be tried, and if the present powers were increased many other cases might be tried with expedition. There would be a sympathy for the County Council for not being able to build their offices in Trafalgar Square. Had the scheme been carried out, it would have created one of

the finest squares in Europe. It was laughable to find that bricklayers in search of recreation and health went to the Council for work. Somehow they managed to find that the works committee did not require so much of them as the ordinary builder.

Mr. Payne responded. He remarked that perhaps there was nobody so misunderstood as the County Council. Those who depreciated their work knew the least about them, and he advised those people to try and learn something of their administration. The chief drawback to the present municipal work was the lack of proper offices and the difficulty one experienced in finding one's way about the existing buildings.

Mr. Candy, Q.C., proposed the toast "Architecture and the Society of Architects." He said he was only an understudy on that occasion, but he wished the Society success in its efforts to secure harmony and good-feeling among members of the profession.

The President in reply said the Society was progressive; the members sought to elevate themselves by scientific and technical education. The object of the Society was to raise the standard of architecture and put a check on the number of inexperienced, uneducated and unqualified members of the profession. He hoped Parliament would not favour these practitioners by excluding education and registration Bills for the profession.

Professor Banister Fletcher in proposing the toast of "The Arts and Crafts allied to Architecture," referred to the importance the success of the arts and crafts must bear to the enjoyment of the nation. Mr. R. Roberts, J.P., and Mr. Wyke Bayliss responded. The toast of "The Visitors," proposed by Mr. Lovegrove, was responded to by Judge Emden, who looked upon it as a great treat attending these gatherings, not only a social one but intellectual, and he thought he might say on behalf of all the visitors that they wished the Society every success. The toast of "The Press," proposed by Mr. S. Trevail, was responded to by Mr. Harvey Piper.

## A CANADIAN VIEW OF THE STYLE OF THE FUTURE.\*

(Concluded from last week.)

LET us conceive the experiment tried under the most favourable conditions. Let the designer be a man who has been brought up like a Nazirite from his birth with a view solely to this experiment. Let us assume that he has been thoroughly trained in the theory and practice of construction so that the most intricate problems present no difficulties to him. But with all this knowledge of building he has never seen a book on architecture nor a photograph of any architectural example, and he knows nothing of ornamented construction. Let us suppose further that he is naturally a man of artistic temperament to whom the beauties of nature are a constant delight, and that he is a lover of painting and sculpture. Now suppose a problem set before him to be worked out without regard to cost or any other limitation. The subject selected would probably be a large church, because religion has caused the production of a greater number of architectural monuments than anything else in the world. Now how would he go about it? The first idea would be that a large number of people must be able easily and comfortably to see and hear the whole of the service. This means to begin with a large open space unencumbered with piers or columns; altogether there would be no objection to the use of these outside of this space to form aisles or other adjuncts. But they would not be absolutely necessary as constructive expedients because the use of trusses renders it easy to roof over without intermediate supports any space that could possibly be required for an audience room. A consideration of the *pros* and *cons* in regard to the different available forms would probably lead to the conclusion that a rectangular plan not very far removed from a square would be, upon the whole, most convenient both for sight and hearing. Perhaps it might be more convenient to put staircases, vestries, schoolrooms and other appurtenances in projections rather than within the main walls. Something of the nature of an apse or chancel might be rendered necessary by the ritual. A tower might be necessary for bells. Some stacks might be required for smoke flues and ventilating shafts. Windows and doors would be necessary, and perhaps also porches. If the roof were of truss construction a greater thickness of wall would be necessary under the ends of the trusses than elsewhere, which would break up the uniformity of thickness of the walls. That appears to be all. Two other factors, however, remain to be considered—materials and climate. In a country in which stone is the usual building material, and in which large stones could be readily procured, lintels would probably be used to cover the openings to save the labour of cutting voussoirs for arches. On the other hand,

if only small stones or brick were available the openings would naturally be arched over. Considerations of climate would probably determine the pitch of the roof and how the eaves should be formed, whether by projections or otherwise, also perhaps whether there should be an inside ceiling to form an air space or not. The dimensions of the windows and the character of the glass would be determined partly by the quality of the light and perhaps by the character of the service to be performed in the building. In a cold, bright climate the windows might be smaller than in a warm, foggy one. If the service were one in which books had to be used by the whole congregation, more light would be needed than if the ritual were not committed to paper at all, or if books were used only by the clergy conducting the service. It might even be desirable to have only a "dim religious light" in the portion of the building occupied by the audience, in order that they might better see what was done by the officials conducting the service, on whom a bright light should therefore be thrown.

The raw materials out of which the design is to be made are now lying ready to the designer's hand, and it cannot be said that they are lacking in possibilities. The first thing to be done is to arrange the different features in the relation to each other that would be most convenient for the purposes of the building. This would soon be accomplished. Up to this point all has been plain sailing and no difficulties have presented themselves to our designer, accomplished as he is in engineering and building, but ignorant of architecture. But now a new problem presents itself. Aesthetics must be taken into account. The building is not only to be strong and convenient, but it is also to be beautiful. The designer has now gone as far as his knowledge of building will carry him, but if he were to stop at that point the result would simply be building and not architecture at all. How much further will his natural artistic instincts and cultivated taste carry him without any knowledge of existing architectural forms? Bringing these to bear upon the character of the materials to be used, he would probably see that polished variegated marbles would call for some treatment requiring large unbroken surfaces, while a material of uniform texture, especially if light in colour, would require to be broken up to get the effect of light and shade. They might also enable him to compose his raw materials in masses, so as to produce agreeable effects of light and shade. But he must go much further than this to produce anything worthy of being mentioned in comparison with the masterpieces of ancient or modern architecture. There must be beauty of detail as well as of outline, and play of light and shade on surfaces as well as in contrasting masses. He would now have to go on to express the construction by suitable detail, and enrich it with appropriate ornament, so as to form a beautiful and harmonious whole. If, with the limitations we have assumed, he were able to accomplish this, he would thereby prove himself such a heaven-born genius as has never yet appeared in the world. All his ideas of outline of masses and play of light and shade and beauty of form would have been derived from a class of objects entirely different in shape, proportion, colour, and texture from those with which he was now called upon to deal. He would be practically in the position of a student, say of electrical science, who had studied the theory of electricity but had never seen a dynamo or other electrical machine. Such a person would probably discover on taking his first model to the patent office that he had wasted his time in inventing again something that had been invented in the very infancy of the science. Our designer would be in the same position. So far as architecture is concerned he would be in the position of a child or a savage, and his best efforts would inevitably be crude and puerile.

Now let us suppose the same problem presented to an architect trained in the modern or eclectic school, the sole proviso being that his design should be beautiful, but absolutely devoid of style. Would it be possible for him to divest his mind of all his accumulated knowledge of the architectural forms and details and ideas of the old styles as a slate is cleaned off with a damp sponge? Is it not more likely that from the very first steps in the arrangement of his plan he would be influenced by recollections of the old styles? He could not divest himself of the influence on his taste of those buildings which he had admired and studied. Try as he might, he would find recollections of basilica or temple or cathedral or mosque suggesting ideas as to the treatment of his raw materials, and insensibly he would find himself designing in some familiar style. He could not help himself, because style consists not merely in ornamentation, but also in structural form and disposition of mass. So the questions of style and external treatment have to be kept in mind even in the arrangement of the ground plan. The consideration of the nature of the various materials alone would bring him face to face with the question of style. Is the ruling motive to be the beam or the arch? This might not be determined by local circumstances, and so the one system might be as available as the other. What is to determine it then? The aesthetic taste of the designer. And having once made his choice his artistic instincts would lead him to adhere con-

\* A paper read by Mr. D. B. Dick at the annual convention of the Ontario Association of Architects.

sistently to the principles of the system chosen. The leading lines must necessarily be either horizontal or vertical, because every great architectural monument that has ever been produced has been either in one style or the other.

No, it is not thus that a new style of architecture will ever be invented. Man is always the heir of all the ages, and his heritage is the sum of the learning and knowledge that have been slowly accumulated in the past. Progress is only made by advancing beyond the highest point previously reached. The men who originate new ideas are those who are most familiar with all the ideas of their predecessors. New inventions are most likely to be made by those who are most familiar with all previous inventions. So, in art as in science, that man is most likely to invent a new form whose mind is most saturated with the best of the old forms.

Some attempts have been made to produce a new style by harking back to some old style at an incomplete stage in its development, and trying to carry it onward on some other lines than those on which it was actually developed. This appears to have been Richardson's idea in attempting to revive the Romanesque style, and to that extent his attempt differed from most other modern attempts to revive old styles. None of these attempts have had any better result than to galvanize the old forms into a semblance of life more or less ephemeral according to the ability of the apostles of the cult for the time being. Examples of the more recent attempts will at once occur to you—the Gothic revival, Norman Shaw and the Queen Anne, Eastlake and his so-called principles of "Truth." It is curious to observe in Eastlake's case how some of the designs in his own book belie every one of the principles laid down in it. It is difficult, for instance, to conceive on what principle of truth a book-case can be designed which is finished on top with an imitation of a shingle roof with dormer windows. As regards Richardson, it is futile now to speculate what he might or might not have accomplished had he lived to the allotted span. His experience would doubtless have been that of all others who have trodden the same path. Measured by actual results, his influence upon the architecture of this country has not been beneficial, not so much because of what he did or failed to do, but because of what his imitators have done. Richardson went to original sources for his inspiration, but most of his imitators have only gone to Richardson, and the result therefore cannot be considered surprising.

Attempts have sometimes been made to combine the outlines of one style with the details of another, but no new style has ever resulted from these attempts. The best example of this is probably the French Renaissance of the time of Francis I., where the outline is Gothic and the details mostly Classic. The effect is picturesque, but there was no vitality in the resulting style or variety. The English Elizabethan is of the same type. The term "debased" applied to it by the Gothicists is not inappropriate, and no better instance of this debasement is to be found than in the west front of Westminster Abbey, where the Classic details look strangely out of place on the Gothic front.

If, then, all attempts at revivals have failed to produce a new style, if the eclectic method has failed, if the invention of new constructive methods and the creation of new needs have also failed, and if the attempt to dispense with style altogether is sure to fail, is there anything left on which to base a hope that there will ever be a new style? It is a question not lightly to be answered. The conditions under which the old styles were produced have long passed away. Life was leisurely in those old days. There was time to linger over a design until it was as perfect as its author could make it. Men whose work was of an artistic kind worked for the love of their art and took pleasure in their work for its own sake. The styles were not made by men who looked upon their art as a mere means of making a living. In those days each worked in only one style, and all worked in the same style at the same time, and they probably knew little or nothing of any other, so that to them it was the vernacular. They did not dabble in Greek one day and Gothic the next. In some cases they may have had before them examples of the preceding styles out of which their own had grown, but they could only have had such knowledge of these as they could obtain at first-hand. There were no excursion trains to afford them the mental dissipation of a glance at all the monuments of antiquity during a summer holiday. They had few books, still fewer illustrations, and no photographs at all. So it is not surprising that some of the Romanesque work, for instance, was obviously the result of efforts at recollection of Roman forms, which might perhaps have been copied literally, had the means only been available in the shape of a library. Men were, therefore, compelled to think for themselves instead of borrowing the thoughts of others. The growth of a new style was an affair of centuries. The best Egyptian or Greek architect, if called upon to design a spire, would probably have pronounced it impossible. And so it was within the time at the disposal of one man or one generation. But it kept the problem before one generation after another, and gradually the thing is done—not all at once or by one man, but slowly through many tentative efforts and failures success is finally

reached, and the Greek temple becomes the Gothic cathedral. Mr. Sturges puts this idea very well when he says, "Once only in a series of centuries appears an architectural thought destined to grow great and stimulate other thoughts, and call out their embodiment in visible form."

The shadow cannot move backwards on the dial and the old conditions can never be restored. Some one said recently that "the most fertile mind—much less the average—is not able to produce from the use of the material and purposes of the structure an entirely original supply of forms, especially within the limit of the time allowed for the occasion." That is true, and therefore every architect must express his ideas in the forms of some known style. All styles are open to the choice and all are alike alive or alike dead to this generation. The history of the last three centuries seems to point to the Renaissance as the one most in touch with the spirit of modern life. It is by far the most plastic of all styles. It is suitable alike for all classes of buildings, from the most humble to the most palatial, and for every purpose—domestic, ecclesiastical, educational, commercial, municipal, national and monumental. So long as the fancy is restrained within the limits of good taste its forms can be used with the utmost freedom and adapted to every purpose. Every young architect after having acquired a general knowledge of all styles, should take some one and make it his own and try to know it thoroughly, in its principles, its history, its monuments and its details, and he should design in that and no other. If the Renaissance is chosen then some one phase of it—say French or English—should be thoroughly mastered before another is taken up.

It cannot be predicated with certainty that there will ever again be a new style. But there are certain principles on which the existing styles should be used, and it may be confidently asserted that if these principles are not followed there will assuredly never be a new style. Blind copying will never produce one. It would be a long task fully to analyse and formulate these principles, but for the present purpose they may be summed up into two propositions—(1) That construction must be absolutely truthful, and must be expressed in forms appropriate to the purposes of the building; and (2) that no moulding or feature of any sort must ever be used merely from habit, or without careful analysis to discover why it is pleasing to the eye and what it means, and even then it should be used only after long and careful consideration whether it should be used at all, what function it is to perform, and whether nothing better can be devised to perform that function.

The following out of these principles may never result in the formation of a new style. Certainly no one man will ever invent one; but it may be that the efforts of some of those who try faithfully to carry out these principles may start an influence that will increase as it rolls onward, until in course of time it will be found that unconsciously a new style has grown up. But assuredly the only efforts that will be of any avail will be inspired by an earnest striving after what is true and beautiful and an honest love for art for its own sake, and only when these are vivified by at least some spark of that divine creative imagination which must be born in a man, and without which he may be a builder but never an architect.

#### ST. MILDRED'S, BREAD STREET.

THE promoters of the City and West-end Railway Bill have agreed to accept the clause which the City Church Preservation Society had proposed in the interests of St. Mildred's Church, Bread Street, subject to the substitution of 70 feet for 80 feet as the depth below the roadway of the tunnel which is to be bored for the use of foot-passengers. In these circumstances Mr. H. C. Richards did not persist in his motion for the rejection of the measure when it came on for second reading in the House of Commons. The new clause, as amended, reads as follows:—"Notwithstanding anything contained in this Act or shown on the deposited plans, the company shall not, except as hereinafter provided, purchase or take or enter upon, use, or interfere with the church of St. Mildred, Bread Street, or any part of the property numbered on the said plans 4, in the parish of St. Mildred, Bread Street, in the City of London. Provided that the company may acquire, and the owners of the said church may sell, an easement or right of constructing beneath the said property a tunnel for the use of foot-passengers only, such tunnel to be constructed by the company at their sole risk and expense, and so that the top thereof shall not be less than 70 feet below the surface of Bread Street. And provided also that the company shall use their utmost endeavours to prevent any damage or injury to the said church or any part thereof during the construction of the said tunnel, or at any time after the completion thereof in consequence of the construction, use, or want of repair thereof, and in the event of any damage or injury being caused or happening to the said church or any part thereof, or any of the fittings or furniture therein, by reason of the construction, use, or want of repair of the said tunnel, the company will forthwith, at their own expense, repair and make good such damage or injury."

## OLD CORNHILL.

ON the 15th ult. we published a view of Tudor Chambers, Cornhill, and gave some account of that renowned thoroughfare in the sixteenth and seventeenth centuries. Through the kindness of one of our friends we

are now enabled to give a reproduction of a rare etching, which shows Cornhill about 1630. It is a bit of Old London, and suggests that although much that was picturesque had to be sacrificed, the Great Fire, which directly or indirectly led to the removal of so much that was dangerous, must have been a blessing in disguise.

OLD CORNHILL, LONDON, ABOUT THE YEAR 1630.

## NOTES AND COMMENTS.

MR. G. F. WATTS cannot be considered by the crowd as a successful painter, but there is no one among his contemporaries who has gained more respect. His career has been a rebuke to many artists, for he has remained true to his ideal regardless of disappointments. It must, therefore, have been gratifying to Mr. WATTS when he was surprised on Tuesday morning by the presentation of an address congratulating him on his eightieth birthday, and expressing the hope that he might be spared to practise his art for many years to come. A ceremony of the kind is unusual in this country, but the circumstances justified it. The address was signed by the Prime Minister and other statesmen, the Archbishop of Canterbury, the Lord Mayors of London and provincial cities, the President and Council of the Royal Academy, officers of the British Museum, the Science and Art Department, the National Gallery, the National Portrait Gallery, the Royal Society, the Society of Antiquaries and others. The address was accompanied by a sonnet from Mr. SWINBURNE, and a bronze medal designed by Miss HALLÉ. Mr. WATTS has a wider circle of admirers than was represented by the signatories, and all who know the artist only by repute will be no less desirous that he may long remain as an honour to English art.

LONGFELLOW has made all readers of English acquainted with the legend of WALTHER VON DER VOGELWEIDE, the Minnesänger, who when dying gave all his property to the monks of Würzburg in order that they should daily feed the birds upon his tomb. It is added that "time has long effaced the inscriptions on the cloister's funeral stones, and tradition only tells us where repose the poet's bones." The Historical Society of Würzburg a few days ago discussed the subject of WALTHER'S grave. Dr. KERLER explained that various positions in the Neumünster (which is a very old church) were assigned to the grave, but his conclusion was that the grave was in the cloister. About sixty years ago the inscribed tombstone was there, but it has vanished. An old gentleman who was present at the meeting, said he remembered the stone, for he often played marbles on it. There were small troughs in it for the food and drink which, by the terms of the poet's legacy, should be supplied every day for the use of the birds. WAGNER'S "Tannhäuser" has revived an interest in the Minnesänger and their poetic and martial contests. WALTHER VON DER VOGELWEIDE shares in it, and accordingly a statue of him is to be set up in an open place near the spot where he was buried.

It cannot be said that any of the English museums show an excess of decoration. The British Museum would become more attractive to crowds, and therefore more useful, if the Trustees could expend some money in overcoming the monumental chilliness of the galleries. The most expensive decorations in the South Kensington Museum are the full-length artists' portraits, and they were produced at cost price or less. It is therefore unnecessary to stipulate that if the same Museum is enlarged the new courts should be left unadorned in order that the contents would be seen with more advantage. Mr. ASTON WEBB, who has exhibited marvellous patience over his accepted but unutilised drawings, says in a letter to the *Times*:—"The report which accompanied my design explained that the walls of the courts and galleries had been purposely left without architectural embellishment, being arranged solely with the view of placing objects upon them, decoration being confined to the entrance-hall and staircase; a view of this latter portion only has been published, and may, therefore, have been misleading as to the general character of the interior design. After my formal appointment as architect in 1891, the internal planning of the building was very carefully considered in conference, both with the Office of Works and the Museum authorities, and I was further considering the exterior design when the drawings were stopped, and I have since been anxiously waiting instructions to proceed. That the best architecture for a museum is that which interferes least with the objects shown, and that good lighting and planning should be the leading considerations for such a building is perfectly true, but I venture to think, sir, that beyond this it is the duty of the architect to remember that

he is entrusted with the erection of a great national building to shelter some of the nation's greatest art treasures, and that he would not be properly fulfilling his duty by the provision of a mere utilitarian structure." South Kensington has become a by-word on account of its sheds, and it is time there was a change. In no foreign museum are such costly objects so unworthily housed.

THE REGISTRARSHIP of the Art School at South Kensington may not be the most important office under the Science and Art Department, but it is essential that the holder of it should be familiar with the peculiar routine of the school, or, in other words, should be acquainted with the history of the origin and development of the system. Students are shy of dealing with an ordinary example of circumlocutionism, and it is advantageous for them to be able to refer to somebody in authority when there are doubts over questions which are not within the province of the art-masters. The office is now vacant, and for the sake of the school it is desirable that whoever is appointed should have some other claims to respect than those which belong to a mere example of an arbitrary display of patronage. We have always upheld the advantage of securing for all branches of the Department's service the aid of men who might be called outsiders, but it was on the understanding that they possessed power which was not attainable among the officers. But it is absurd to thrust into any of the appointments a gentleman who may need a long term of coaching from another official, or the continuous aid of a special auxiliary. That experiment has been tried, and the experience of the inconvenience which followed should be enough to restrain any attempt at its repetition. The present time is also not opportune for a return to the ancient process by which interest secured office, while merit was rejected, for the opponents of the Department on a Parliamentary committee could make capital out of an ineligible selection for a humbler office than that of registrar.

THE importance of the easement of support has been exemplified in the Court of Appeal under rather novel conditions. The plaintiff was the owner of two houses on the cliff at Hastings. They were not erected by him. The original owner made an excavation at the back to obtain courts for them, and to insure their security erected a retaining wall to uphold the cliff above them. The defendant also owned houses which were erected above the plaintiff's, as well as an open space which was obtained by an excavation of the cliff. There was also a retaining wall, but it was in front of the premises—unlike the wall below, which was at the back. The upper wall was apparently calculated to withstand the pressure which would arise by any decay of the cliff at the place, although there was not sufficient provision for drainage. The excavated rock, amounting to about seventy tons, was also added to the load on it. As a consequence the upper wall succumbed, and with a part of the cliff attached to it fell on the lower wall, which of course was unable to withstand the weight, and was almost entirely destroyed. Mr. Justice MATHEW, after hearing the case, gave judgment in favour of the owner at the lower level, and assessed the damages at 150*l*. The defendant appealed, but the judgment of the Court below was not disturbed. The Master of the Rolls ascribed the origin of the accident to the excessive weight, a consequence of the excavation, by which the load on the upper wall was increased. There was no default by the plaintiff, and the defendant alone could be held responsible for the damage. The moral to be drawn from the case is, that there are unusual risks in building on the cliff of Hastings; but it is to be feared that there and in similar places there is a belief that a retaining wall acquires additional strength from being contiguous to a rocky mass, while in reality it is the wall which has to strengthen the rock.

## WINCHESTER CATHEDRAL.

IT is often an advantage to be able to consider English objects and institutions as it were through the eyes of foreigners and strangers, for in that way the drawbacks of too much familiarity are partially removed. The English cathedrals are pleasing to our French visitors because they see in them evidence of the influence of their countrymen at an early age. But Americans consider the buildings with more affection than is given to them by inhabitants of the cities in which they are placed. Mr. J. F. HUNNEWELL, who has made a dozen tours through the country, expressed American sentiment when he said:—"Around these venerable cathedrals the history, character and sense of beauty of the people, with the power and grace of the deep faith of England, appear in forms that are visible, making all they embody real to us, and the land fairer and more

church, being 556 feet by 250 in breadth of transept. I think I prefer this church to all I have seen, except Westminster and York. Here was Canute buried, and here Alfred the Great was crowned and buried, and here the Saxon kings; and later, in his own church, William of Wykeham. It is very old; part of the crypt, into which we went down and saw the Saxon and Norman arches of the old church on which the present stands, was built fourteen or fifteen hundred years ago. Sharon Turner says:—"Alfred was buried at Winchester in the abbey he had founded there, but his remains were removed by Henry I. to the new abbey in the meadows at Hyde, on the northern quarter of the city, and laid under the high altar. The building was destroyed at the Reformation, and what is left of Alfred's body now lies covered by modern buildings, or buried in the ruins of the old." William of Wykeham's shrine tomb was unlocked for us, and Carlyle took hold of the recumbent statue's marble hands and patted them affectionately, for he rightly values the brave man who built Windsor, and this cathedral, and the school here, and New College at Oxford.

WINCHESTER CATHEDRAL, WEST DOOR.

lovable and precious. The hearts of the builders have been English, and they have built each throb in with the stones wrought to make shrines that have long kept, and, we may hope, will save for all time the unique record of the steadfast piety and wise endurance that have made the small, wild island become the throne of the world-wide empire, telling its people of this every day, and that the nation's strength and glory will endure while they, like what they signify, remain secure." In the case of Winchester we have a record of the effect it produces on one of the most distinguished Americans, R. W. EMERSON. He visited the cathedral in company with THOMAS CARLYLE, and he gives the following account of his impressions:—

In the cathedral I was gratified at least by the ample dimensions. The length of line exceeds that of any other English

It is easy to understand why an American, who was accustomed to look at long stretches of open country should feel less restricted in Winchester than in the majority of cathedrals, although the total length of the building was little over the tenth part of a mile. EMERSON might consider the forest alleys with which he was acquainted, and which resembled those that in an earlier age suggested the aisles of Gothic buildings, as far excelling any vista at Winchester. But he would be the first to acknowledge how immeasurably in historic interest the cathedral surpassed all the buildings in the States. With the exception of Westminster Abbey there is, indeed, no church in all England which was so closely connected with the rulers of the country during a long series of years. It may be well to recall how that arose and why the connection declined.

From its advantageous position within easy reach of the sea, the Romans considered the place where Winchester now stands as a fitting site for a settlement and they probably utilised an early British village. No record of that time relating to the place has survived. Afterwards the historic notes are few and far between. In A.D. 534 CERDIC the Saxon ruler was buried at Winchester. In the next century BIRINUS, the Roman missionary, was fortunate in converting CYNEGILS, the thane of the district, and his son CENWALH, or COINWALCH. The rite was administered at Dorchester, and there BIRINUS was set up as bishop. But it was only a provisional arrangement, for the erection of a church for the bishop at Winchester was then contemplated. It was afterwards erected in a style that amazed the people of Wessex, and was endowed with a vast domain, part of which still yields a revenue to the cathedral treasury. Owing to the reverence for associations which inspired the old church builders, it is not unlikely that the site of the seventh-century building, and it may be of the Roman church as well, is within the precincts of the existing cathedral.

The times were troubled, and Wessex appeared to have experienced alternate victory and defeat for many a year. The petty kings were unable to agree. The princes, we suppose, committed acts in their warfare which, on reflection, they believed to be wrong, and hence we read of long, toilsome and expensive journeys to Rome in order to calm their consciences. At length, in the ninth century, under ÆTHELWOLF, who had been, it is said, a monk, Winchester rose to the foremost place among the cities of Britain, and the Church throughout the country assumed an authority which the early missionaries could not have anticipated. When his youngest son ALFRED ascended the throne, and when peace prevailed, Winchester was not only the capital of a great king, but a school of arts and literature. ALFRED's literary efforts are familiar by name to all, and on their account he must be included in every list of royal authors. As regards art, LINGARD says that "among his artists were numbers of foreigners attracted by his offers, and by his frequent conversation with them he is said to have acquired a theoretical acquaintance with their respective professions which astonished the most experienced workmen." ALFRED died in 901, and was buried in the cathedral. He had resolved to found two minsters in Winchester, and to one of them, the "New Abbey," which his son EDWARD erected, his remains were afterwards transferred. From thence they found their way to Hyde Abbey, which in the last century was superseded by a lunatic asylum. After imagination has traced the noble dust of ALEXANDER until it is found stopping a beer-barrel, the fate of ALFRED's dust deserves to be next considered. It is now impossible to discover for what reason he wished to set up a rival to the old cathedral, and subsequently the wisdom of the new foundation appeared dubious, for the two ecclesiastical establishments were often at loggerheads. Apparently Bishop ÆTHELWOLD, as one means to settle the contests in the middle of the tenth century, began a new cathedral, and somehow was able to persuade the monks to engage in the operations, although it might be supposed their rivals, the canons, would have all the advantages. The building was consecrated in 971, during the reign of King EDGAR.

Forty years afterwards Winchester was in the hands of the Danes. CANUTE was a respecter of churches, and it was on the crucifix of the high altar of the cathedral he placed his crown after he had convinced his flatterers and parasites that the waves were not subject to his power. If he had lived the fate of Winchester, and of England too, might have been different. But the greatest of the Vikings died in his fortieth year. His widow EMMA remained in Winchester when her son EDWARD THE CONFESSOR, the son of ÆTHELRED, reached the throne. After the death of his half-brothers she was considered by the new king and his supporters as the most dangerous enemy of the English race. Winchester became in their eyes as a hostile fort. The Saxon Chronicle records how EDWARD unexpectedly swooped down on the city, seized all the treasures which EMMA had amassed, and swept away the cattle and corn from the lands which were her dower. She was, however, allowed to remain in Winchester until her death in 1062. She was buried in the cathedral. But while living her presence was not pleasing to her son, and EDWARD held no council in Winchester until after her death.

The absence of EDWARD, as well as other causes, strengthened the power of the foreign element in Winchester. EMMA was a Norman, and naturally was inclined towards her countrymen. EDWARD, who appears to have been a good prince so long as there was no event to disturb him, was, out of policy, no less friendly towards the Normans. In preparing the way for the invasion, the clerics of Winchester Cathedral were as zealous as if the whole system of Church government were in jeopardy unless the strangers quickly arrived. When WILLIAM THE CONQUEROR marched through England, he found no opposition to his taking possession of the citadel of Winchester, which was the strongest in England. He decided to make it his residence during spring, Gloucester serving for the winter, and London for the summer season.

WILLIAM was not disposed to allow any exceptional conditions to Winchester in his mode of dealing with England. He showed no respect for the loyalty of the monks of the New Abbey to HAROLD and the English cause. According to THIERRY, he had resolved on the simultaneous deposition of the higher English clergy everywhere, and to rule in Winchester one of his relatives, named WALKELIN, was selected. Like the majority of the Conqueror's new bishops, WALKELIN believed in the policy of having splendid and substantial churches, and in 1079 he commenced his operations, in order to supersede the cathedral which Bishop ÆTHELWOLD had erected a century before. It is not easy to determine the relation of the Norman to the Saxon building. Mr. GARBETT, an architect who had charge of the cathedral in the early part of the century, used to maintain that a very large portion of the old masonry yet remains, because WALKELIN wished to demonstrate to future ages by means of it that the Norman builders were far superior to their predecessors. It is, moreover, superior in endurance to much later work. Dean KITCHEN has come to the following conclusions on WALKELIN's building:—

It is possible that Walkelin placed his apse close to the west door of the older English church, and when his main fabric was completed, pulled down the old church and built his lady chapel on its foundations. There is some masonry of high antiquity in the crypt, just to the east of the lady chapel apse, which seems to countenance this view, and if this is a correct surmise, we may venture further and claim that the present cathedral, in part at least, stands on the site of the oldest Christian building of these parts—that Roman church in which the gospel was preached to the primitive inhabitants of the district. Walkelin's church was fourteen years in building. When finished it was almost as large as it is to-day, for it was planned to run 40 feet farther to the west than it does now. Of this huge edifice the massive transepts remain almost unchanged; the long nave, hidden under William of Wykeham's remodelled building, is still there, walls and piers being still Norman; the tower, which fell in 1107, was soon rebuilt in somewhat later Norman style; and though the Norman lady chapel is gone, its ground plan and features remain in the crypt, lately cleared out and made once more intelligible to all who visit it. The stone for the building came by water to Winchester from Quarr in the Isle of Wight, and the cost of the work must have taxed to the full the resources of both bishop and monastery. Indeed, we see this in the quarrels which marked the first years of Bishop Giffard and in the grant to Walkelin by William Rufus of the profits of a fair on St. Giles's Hill in 1094. But the most dramatic incident in the building is of an earlier date, when William the Conqueror granted Walkelin as many trees in Hemptage Wood as he could fell in three days wherewith to roof the nave. The bishop called together "carpenters innumerable," and swept off the whole wood of oak trees, leaving nothing standing there save the traditional "Gospel Oak," under which St. Augustine is said to have preached. The bare stem of this ancient oak still stands, and by it yearly, when bounds were beaten, the parish priest used to read, till quite lately, the gospel for the day. The solid trees thus carried to Winchester are still to be seen in the roof of the nave above Wykeham's stone groining, and they are as sound as when they were first hoisted up more than eight centuries ago in 1086.

Although Winchester was safe enough under the control of his officers, it did not possess all the qualities which WILLIAM I. desired for a capital. He recognised the capabilities of London to be the seat of government, but owing to the strength of its citadel he continued to utilise Winchester as a treasury. The first act of WILLIAM RUFUS was, therefore, to seize on the citadel, and when he was

pierced by an arrow in the forest his brother, HENRY I., was no less eager to take time by the forelock in gaining possession of the wealth which the second WILLIAM had left untouched. WALKELIN, meantime, took advantage of the state of affairs to gain privileges which would enable him to complete his cathedral. The Red King made over to him the royalties of St. Giles's Fair as well as other sources of revenue, and he utilised the money on building. He was zealous as an ecclesiastic, but in the great contest between ANSELM and WILLIAM RUFUS he stood by the king. Retribution followed, for he died in 1098 through sorrow arising from a royal demand for money which he was unable to supply.

He was succeeded by WILLIAM GIFFARD, who was not consecrated until 1107, and in that year he had to encounter the difficulty of erecting a central tower in place of WALKELIN'S, which had fallen. That was not an unusual fate for Norman work when carried to a great height, although when it did not rise beyond the dimensions of such a transept as is found at Winchester the masonry may appear as if capable to endure for ages.

GIFFARD was succeeded by HENRY OF BLOIS, a nephew of King HENRY I. He was a young man of twenty-eight, and it was natural for one of his race to be ambitious. His desire was to have Winchester raised to an archbishopric, and in the contests of the time between the Empress MATILDA, King STEPHEN (the bishop's brother), and others, his conduct appears unaccountable, unless we realise the object he had in view. In the family and personal squabbles which were then enacted in Winchester the dignity of history is not to be discovered. The bishop had fortified his castle, and he was not ashamed or afraid to cast red-hot missiles from it on his flock, or to reduce Hyde Abbey to ruins, although he was its official protector. Afterwards he endeavoured to make amends for his turbulent conduct, and when he died it was said of him that never was there a man more eager to adorn his church. His work in the cathedral would appear to consist in the erection of a treasury and the presentation of the immense font, which shows scenes from the life of St. NICHOLAS of Myra. He deserves to be remembered, however, as the founder of the Hospital of Holy Cross.

The coming of the Angevine kings, beginning with HENRY II., was not advantageous to Winchester. As a matter of form the king received the homage of the nobility, but it was from London, Woodstock, or Falaise he preferred to rule his kingdom. After BECKET'S death HENRY adopted a new system, and he occasionally visited Winchester. He does not appear to have been a benefactor to the cathedral. Bishop DE LUCY ruled the see from 1189 to 1204, during the reign of RICHARD I. and part of JOHN'S. He gave the first indication of dissatisfaction with the Norman style. He extended the church towards the east and erected a lady chapel. The change was rendered necessary by the number of pilgrims that visited the shrine of St. SWITHIN. Several of the bays of the arcades show trefoil arches, but Mr. PARKER considered the style to be pure Early English and quite as advanced as any work of the time found at Lincoln. Professor WILLIS observed a similarity between the arrangement of a double pointed arch under a single trefoil arch, in the lady chapel, and what is to be seen in St. Christopher, Mentz.

DE LUCY'S experiment of employing the new style somehow does not appear to have much impressed the succeeding bishops. A great hall was erected in Winchester in 1235 for royal use, but that did not either produce any effect on the cathedral authorities. A century and a half had to elapse before a bishop arose who was sufficiently venturesome to attempt a transformation of the building. In 1345, when WILLIAM OF EDINGTON was appointed to the see, Gothic had gone through a series of evolutionary processes. It was then in its Perpendicular period. To Bishop WILLIAM are attributed the first two windows on the north side of the west end of the cathedral and the first window on the south side with their buttresses. The great west window is also his work, but the parapet and pinnacle above it were added by his disciple, WILLIAM OF WYKEHAM. WILLIAM OF EDINGTON, from the little he attempted, was able to imagine what his cathedral would become, and on his death in 1366 he bequeathed money to continue the works. (To be continued.)

## THE ARCHITECTURAL ASSOCIATION.

AN ordinary general meeting was held in the rooms of the Royal Institute of British Architects on Friday evening last, Mr. Beresford Pite, president, in the chair.

The minutes of the last meeting were read and agreed to.

Three nominations having been read, the following were elected members:—Messrs. S. E. Barron, C. B. Chesshire and T. M. Wilson.

The Chairman announced that Mr. Arnold Mitchell, F.R.I.B.A., had asked to be reinstated a member.

Mr. W. H. Bidlake then read the following paper on

### The Architect and the Public.

The public is not inherently or intuitively antagonistic to the architect nor the architect to the public. Some assume that this state of hostility does exist. On the contrary, each stands for a mutual help to the other. I must live and be sheltered. This want you will satisfy, and you will make my shelter beautiful for me. For all this I will assist you in turn towards living and being sheltered. What arrangement could be more just, more harmonious? Quite true, and yet the working of the arrangement might undoubtedly be more just, more harmonious. Then comes the question, How? That is the subject for to-night's discussion.

The world is divided by the English schoolboy broadly into two classes, What is good to eat and what is not.

To the architect society appears in similar fashion divided into two groups—clients and non-clients. The former, I think, forms a disproportionately small minority. The architect has the advantage of the schoolboy: he can regard any member of the public as a potential client—perhaps would be wise to do so—but the small boy cannot regard in the same way his rod of chastisement as a potential plum-cake. Literally, too, every taxpayer and ratepayer is a client where state or municipal buildings are concerned. Of course he will take an interest in the matter, will see, as far as he can, not only that money is wisely expended in a well-constructed and convenient building, but that its architectural beauty shall gratify his citizen pride. In securing economy he will undoubtedly do this, beyond that not the slightest.

The unwelcome fact may be faced at the outset:—

The British public is profoundly indifferent to architectural matters. Some one perhaps says no. I reply, "Brompton boilers." From this lethargy one will occasionally awake, and, with a volume of Ruskin in his hand, vehemently denounce the modern architect and all his works. To me it seems immensely to the credit of architects that in the teeth of this public indifference so much good work is done.

No wonder Seti or Rameses could count upon the production of a hypostyle hall at Thebes, superbly grand. The services of the architect were then regarded as amongst the highest in the State.

Under Pericles every Athenian gloried in each fair jewel of that architectural diadem that crowned the Acropolis.

At Florence, in the days of the Renaissance, the same keen interest in architecture invigorated the air her great builders breathed. It braced them to surpass each other, to surpass themselves, to rear works that should be the subject of public praise, even of public gratitude. And of the many great men of that period who practised architecture some have achieved immortal fame.

When a people is deeply touched it is heart and emotions, especially when it has been emancipated from some yoke and is intoxicated by the spirit of freedom and hope, then is there an outburst of music and song and exquisite and grand creations of art.

Such was the case amongst the Athenians after the overthrow of the Persians at Marathon and Salamis, and such when, at the Renaissance, men threw off the superstition and tyranny of the Church which had held them in moral and intellectual slavery.

A certain degree of wealth ungrudgingly spent is necessary before the enthusiasm of a people can express itself in grand architecture. But easy commercial prosperity makes men content with the uneventful commonplace present; it does not set them longing or idealising. Physical luxury and social position is what they ask, and that they may be left alone to make money. Life runs smoothly, and surface currents do not disturb deeper emotions. The arts, however, minister to the pleasures of life amongst those who are cultivated to feel their influence, and so, even in easy commercial days like these, they may not only flourish, but progress in a steady, quiet fashion, provided that public apathy be replaced by a keen appreciation. For no lovely flower blooms in the garden of neglect.

An architecturally appreciative public would stimulate the architect to produce his best. He would produce better work than he could do in an indifferent world. All his faculties would be awakened. The prospect of public commendation would stimulate him to create something worthy of public praise. But, gently. He will need more than that. Public

praise is very well, but what if it be the applause of ignorance? Public appreciation, to have any worth and to be capable of influencing the best men, must be critical, and founded on knowledge and good taste. Else will it only be despised.

This leads us to consider a second unwelcome fact. The British public is profoundly ignorant in architectural matters. How could it be otherwise? Indifference breeds ignorance, and ignorance indifference.

People for the most part do not even know what architecture consists in. Some seem to regard it as the application of archæology to modern building, a view which has been fostered by architects themselves. There are some clergymen, for instance, who have studied Parker's "A.B.C. of Gothic Architecture," or have mastered the terms in a glossary, whose lecturing on correctness of style the architect finds much more trying than modest ignorance. And we may, no doubt, recall one or more amateur architects whom a little knowledge has made extremely dogmatic.

The popular idea of architecture is that of ornamenting buildings. Here is a barn or factory. Only cover it with sufficient ornament, and it will become architectural. The ornament may be inappropriate and misplaced, it matters not. Before it was a plain, ugly building, now it is a beautiful one; it is a work of architecture. Such a view might be pardoned in an uneducated man, but it is the view of many an otherwise well-educated man. It is notorious that many people of taste who can appreciate good music, and painting, and literature fail in understanding the excellences of good architecture.

If a building is treated in simple broad masses, it is called plain and ugly—that is, unornamented. The grandeur of breadth and mass is the last thing that the public will admire, unless it be that equally fine quality of reticence. No doubt there is a winning grace in modesty, theoretically, but the Englishman likes to see a man push himself to the front, and he likes to see a self-assertive building too. He calls it a "handsome structure."

This popular architectural taste is especially to be deplored, because it is answerable for the production of an ostentatious class of building which is vulgarising whole districts. And we must suppose that there are architects as insensible as their clients to modesty and refinement in design, or else that they are content to sacrifice whatever principles they may have to captivate the popular taste.

Another popular fallacy is that the planning of buildings and the designing of them are two separate processes, and further, that a building may be designed on paper. So it may be by the experienced man who is reading the perspective value into every part of his drawing. But this paper and T-square designing is, I fancy, one of the chief causes of architectural failure. The right treatment of building material is a matter about which the public has no ideas at all—in fact, does not even know that there may be a right and a wrong way of using material, still less that this is an important factor in judging the excellence of a building.

The effect of this widespread ignorance is not only that architects are deprived of the stimulus of cultivated public opinion and approbation, the public itself is a loser. For not being able to criticise its architects intelligently, and being perhaps conscious of the fact, it is at their mercy—and the tender mercies of an architect may be very cruel. Having revived Greek, Mediæval, Gothic, or some other more or less unsuitable style, the architect will tell his client what is at present the fashion and what is the proper thing to have, and the client, with British long-suffering, will pay heavily for being made miserable and uncomfortable until his lease or his life runs out.

But why should this public ignorance of architecture surprise us? From our youth up we have been taught music, and have studied English literature. We have also been taught English history, as being for the most part a series of sanguinary conflicts between England and France, with occasional civil wars at home; but no one has instructed us how to read for ourselves the history of our forefathers written in the stones of our village church. Is it not astonishing that the study of English architecture is not part of a school or at least college curriculum? What better method could there be of teaching a boy to observe accurately, and reason from his facts? Even in the schools of art throughout the kingdom we may find, perhaps, building construction taught, but the study of architectural history and design is conspicuous by its absence.

A man ought to be considered as lacking in the cultivation of an English gentleman if he did not possess more or less knowledge of English architecture at least.

Can this be remedied? If architects who have presumably studied the subject exerted themselves to further its claims by bringing it before public notice, by assisting in the appointment of architectural professorships and lectureships and the foundation of architectural scholarships, and by exciting an interest in their own neighbourhood in architecture, much might be done towards securing public recognition of the claims of architectural study. This, of course, would not necessarily

mean a purification of architectural taste, but it would assuredly tend in that direction. It is vastly more important that our streets, wherein we walk every day, should be adorned with beautiful buildings than that we should be able to listen to grand music for a few hours in the winter season. Yet we think much more of our concerts than of our street fronts.

One of the most important departments of municipal government nowadays is that which deals with the erection of new buildings. Never by any chance is an architect, whose experience might be invaluable to his town, found to offer his services on its council. No: architects neglect their opportunities of advancing their art and instructing public taste, and stand by and whimper.

Indifferent as the average Englishman may seem towards architecture, he is not so any longer when his interest has been excited. He really wishes to know what is good and what to admire, and if he is authoritatively told to do so he will admire it. But he must be taken in hand; first he will not take the initiative, and it is the architect from whom he has a right to expect this leading.

He is for the most part unimaginative and commercial. He worships a fact, especially if that fact is a bargain sealed to his own advantage. So when he builds he likes to see his money's worth. Refinement of proportion is a quality which eludes him. Ornament is tangible. Let him have plenty of it and full flavoured, and he will be content; he will even praise his architect. But if the beauty of proportion and grouping, breadth of mass and breadth of light and shade, of reticence and all those other evidences of refined thought were pointed out to him, he is not so insensible but that he would learn to admire them. But who will point them out to him? Not architects, they are too busy with their private practice.

If this be the attitude of the public towards architecture, how does it regard the individual architect? Frankly, it cannot see the reason for his existence. It does not regard him as the practical man—that term refers to the builder. He is a luxury and an expensive one, and his services may be dispensed with, especially in these days of municipal and rural inspection, when you can rely on the "authority" for seeing that your drains are right and walls dry.

People are quite ignorant of the *modus operandi* in designing and erecting a building. They think that when an architect has made a plan and designed an elevation, and obtained a builder's estimate, he has practically finished his work. They have no idea of the immense amount of detail work necessary, of the varied knowledge required, of the responsibility, anxiety and labour entailed.

It comes as a surprise to most clients who have had no previous experience of buildings to see the number of drawings required, and to find the architect actually giving his attention to the most minute details.

If this knowledge were generally diffused it would save much misunderstanding. "Well," says a client, "I really had no idea you architects had to do so much work for your money. Why, I should not think the 5 per cent. pays, does it?" And you answer, "Well, perhaps not."

As it is, however, 5 per cent. commission is usually considered a high rate, and architects are frequently asked to take less. Not a few do so rather than lose work, even though they are men of established practice, and it becomes a difficult matter to obtain more than 5 per cent., even for the most elaborate church fittings or church decoration.

If a building is to be erected for a religious or charitable purpose, the architect is often asked to forego part of his commission on those grounds, and if he demurs he is reminded that a subscription towards the organ would be very acceptable. It is desirable to have an imposing ceremony of foundation-stone laying because that stimulates the subscriptions, and the architect is asked to present a silver trowel. Later on, perhaps, he may have to present a silver key for the opening ceremony. As a result, the architect whose practice lies not amongst the commercial, but amongst religious and charitable bodies, is subjected to a perpetual fine, while at the same time the work probably requires a large amount of attention.

Not infrequently a committee will act with contemptible shabbiness towards its architect. In fact, a committee may sometimes prove a very good instance of individual morality and collective immorality. Happily, I have not suffered from these experiences myself, but I know I am fully justified in these remarks from the experiences of others.

On a committee there is usually at least one member who has already had some experience of building, and he assists in formulating the requirements of his colleagues, but the private client is often incapable of forming an idea of his own wants, and the architect has to find them out for him. This sometimes entails a number of alternative sketches, and then, perhaps, the client will decide not to build. He is astonished if his architect then sends in his bill. "Why," says he, "I did not approve of any of the sketches you made me." But he knows at the same time that sometimes his doctor's prescription has done him no good, but he has still paid for it, even if it has done him harm.

Many a patient architect will continue to lay one after another of his most exquisite ideas before unrefined and uneducated wealth to find them brusquely set aside, and will meekly endure with only a sigh for the ill association of beauty and the beast.

Another method by which a client realises his own wants at the expense of the architect is the private competition. This method is becoming alarmingly prevalent owing to the folly of architects in ministering to it. It appears to me a very mean way of getting 100% worth of brains and paying 10% for it. For undoubtedly the client, if he saw good points in the unsuccessful drawings, would not hesitate to incorporate them in his building. I wonder if painters will in time be asked to compete for painting portraits?

Public competitions, on the other hand, provided that a professional assessor is appointed, seem right and desirable. But the offer of a first premium is a delusion and a snare. Why, it always merges in the commission. The architect competes under the tacit understanding that if placed first by the assessor he will be employed to erect the building. It would not pay him to do the immense amount of work necessary in a competition for the paltry and wholly inadequate amount of the first premium. The competition drawings will not serve as the working drawings. All the work must be done over again, and it is right that the architect should receive some compensation for his preliminary labours. There are others, however, to whom these labours have been just as great, and who have not the consolation of carrying out the work. Should not these, too, receive compensation for their work in all cases wherein they have been personally invited to compete, and would it not be far more satisfactory to divide the amount offered in premiums, including, of course, the first premium in equal honorariums to all those who had been invited to compete, than the present system of prizes?

Further, would it not be to the interest of all to limit the number of competitors in any competition and so avoid the enormous expenditure of labour and bad language which the Exeter church competition must have entailed? It is practically impossible for an assessor to select the best out of 400 drawings unless one chances to be of conspicuous merit. No competition should have more than twenty competitors, and these should be taken in the order of their application or by some system of ballot. Those of them, however, who had been invited would, of course, receive precedence.

In the case of one of the competitors submitting a design of great excellence, but at the same time omitting to fulfil one or other of the conditions, it seems wrong towards the public and posterity that they should be deprived of a great or beautiful building on trivial or ephemeral grounds. The right course seems undoubtedly to erect such a building, but part of the commission payable to its architect might be deducted and paid over as compensation to the first of those competitors who had observed the conditions. In any case the latter should receive a substantial compensation, and any course of procedure which might be adopted by the committee in such a contingency should be clearly made known to the competitors from the first.

Now, where the public generally knows little of the extent and character of the architect's work, the attitude of the public towards the architect himself is, I believe, one of distrust. This is the underlying sentiment, the fundamental note, engendered both by prejudice, hearsay and experience. We may be inclined to deny this; we certainly should wish to be able to do so. But is it not true? If it is true, what are the causes? There may be many, but I believe there are two chief ones—the distrust of the architect as included in the general distrust of the term “artistic,” and the particular distrust of him on financial grounds. As a red rag to the Britisher is the very word “artistic,” except as restricted to washed-out colours and painted drain umbrella stands, to which his wife and daughters, instigated by the various ladies' journals, have accustomed him. To him it means faddism, want of common sense, the sacrifice of comfort to architecture, an unnecessary outlay of money without any compensating gain. It means a complex system of gables and gutters, which are always needing repair. Sham half-timber work which warps off in the sun, small windows with a transome at the eye line, leaded glass so arranged that it distorts the outlook, ingle nooks with very uncomfortable straight-backed seats. Ask the Britisher himself, and he will say that if he has to go to an architect at all he will go to a practical one, and not one of those “artistic chaps.”

Now, architects have to blame themselves for this conception of the artistic. The Britisher has shrewd common sense, and his idea of a home is comfort; further, he has an idea that every building should be made as serviceable as possible for its purpose. He does not think it proper to make a building dark in order that its exterior should be in the style of Mediæval Gothic.

I am aware of the extreme excellence of much modern domestic work, and how possible these examples prove it to be to combine the greatest comfort with the artistic in its best and highest sense, but we must remember that the public judges

from the rank and file of buildings and the rank and file of architects.

Undoubtedly most architects set themselves sincerely to interpret their client's wishes, but there are others—a minority—who seek their own reputation at their client's expense, practically compelling him against his will to accept a certain design or certain features of that design.

Now, if a private client consults an architect and has definite wishes, it is the duty of the architect to respect those wishes if he feels they are wise and reasonable. If not, it is equally his duty to persuade his client against them to, so to speak, save him from himself. This is especially the case in an uneducated man, or one who is possessed of some fad of which he will probably tire. If the architect acquiesces without protest, his client will turn upon him afterwards and say, “It is true I wanted such and such, but I did not know much about the business, and I certainly did not foresee the effect of it. I came to consult you as a specialist, and I expected you to advise me. I was quite open to argument.”

If he cannot persuade his client, then he must carry out his wishes, and make the best of the circumstances, for it seems only reasonable that if a man is going to pay for the work he should have it to suit him.

With public work the case is different. The committee stands for the public, and the individual opinion of any member ought not to override that of the architect, who, presumably, better understands the subject. The architect, it appears, convinced of the rightness of his view, should then maintain his position, not dogmatically defending it so much as winning his opponents to his own side by persuasion. The fact is, both a client and a committee will allow themselves to be persuaded by their architect if they put confidence in him.

A further question remains to be considered, one of the greatest importance—the public distrust of the architect on financial grounds.

It is often said that if you go to an architect to build you a house you never know when the expense will end.

The client lays his wants before his architect, and tells him how much he is prepared to spend. Usually the sum is quite inadequate. Of course the architect tells him so. Not at all. He tells him that it will need economy, and implies that the design which he submits, and which meets his client's approval, can be carried out for the sum named. All goes well until the builders' tenders are opened, and then comes the disillusionment of the client. The lowest tender is half as much again as the sum to be spent. The architect anticipated as much, but he trusted to his power to surmount the difficulty when the time came. This misleading of a client as to the cost is of most frequent occurrence. How much more confidence a client would have in his architect if the latter told him at once that it would be impossible to erect the building for the sum named. Not at all. He would doubt the architect's judgment, and say that Mr. So-and-So had built a house of similar size for less money, and eventually he would consult another architect, who was willing to mislead him. Every architect knows that if he is thus frank and straightforward with his client he runs the risk of losing him. Notwithstanding this it is better, even as a matter of policy, and certainly as a matter of professional morality, to let the client know the worst. For you will in time obtain the rare distinction of being regarded as an architect whose estimate can be trusted, and that means in time a practice based on the most solid foundation.

A similar difficulty occurs in competitions. A fixed sum is stated, and competitors must design a building which can be carried out for that sum. Each competitor must give an estimate of cost. Some of them conscientiously endeavour to carry out the instructions in the spirit as well as in the letter. They have to somewhat cripple their design in consequence. Others make elaborate drawings of an equally elaborate building, and give every accommodation that could be desired. They arrive at the probable cost by dividing the sum allowed by the cubical contents of their building, and then, having found a constant— $4\frac{1}{2}d.$  a foot, perhaps—they multiply this by the cubical contents, and find to their satisfaction that it works out at exactly the sum they have to spend. This operation, if judiciously described in the report, is sufficient to throw the committee off its guard, and has even misled the professional assessor. In due time the builders' tenders are opened, and then comes this disillusionment of the committee, and the suppressed growls of the fellow competitors.

But if the public distrust the architect on account of the unreliability of his first estimate, how much is that distrust deepened when the bill of extras is presented.

Here, again, the architect has himself to blame. He cannot, perhaps, prevent extras altogether, but he can do much to spare his client from the extreme annoyance of an unexpectedly heavy bill.

The two most fertile sources of extras are the absence of a thorough thinking and working out of the scheme before the quantities are taken out and the subsequent alterations made by the client himself. Every building ought to be worked out

in  $\frac{1}{4}$ -inch detail and an exact specification written by the architect himself, and not by the quantity surveyor, and then, and not before, the quantities should be taken out. And if a client is inclined to order extras he should be kept informed by the architect of how the bill is mounting up, and he will not then be taken by surprise at the total.

All this takes much trouble, and a client in his hurry to commence work grudges the time spent in making details. Besides, the work may fall through, and then a large proportion of the work will have been done in vain, although the architect will certainly be entitled to claim payment for it.

Notwithstanding these drawbacks, the reputation of being able to build without extras is so unique and so priceless to the architect that it is worth some trouble to win. It will increase his practice more than any misleading shifts, or engaging to do work for less than 5 per cent.

There remains but one more subject for consideration. The public has heard from time to time some talk of illicit commissions associated with the practice of architecture. There have even lately been discussions on the subject in the Press. There may, of course, be no truth in it at all, but the public is naturally suspicious.

Now, while it cannot be doubted that the majority of architects, as upright and honourable men, would not stoop to receive indirect commissions, yet it is an equally undoubted fact that there are some who do. It is useless to disguise the fact as it is too well known. The opportunity of increasing his income by the acceptance of those commissions is no temptation to the well-established architect. But all architects are not well-established; some have a struggle to make a living, and others are just starting in practice and have not thoroughly grasped the moral question involved. Very severe blame, therefore, rests with those manufacturers and others who offer these temptations, and it is the duty of every honourable architect to endeavour to attach a public stigma to the name of any such firm. In fact, a black list ought to be kept by each local association, and the members of that association should undertake to boycott all manufacturers and tradesmen whose names appear on such a list.

But it is not from tradesmen only that architects sometimes receive indirect payments. It is a practice far too prevalent for architects to share in the quantity surveyor's fees. It is not, indeed, to the credit of either architects or surveyors that the practice should exist at all. The architect employs a surveyor to take out quantities, and for this the surveyor charges certain fees, of which he pays the architect a certain proportion. What for? If the architect has properly worked out his plans and written his specification, both of which are supposed to be included in his own fees, it gives him no extra trouble to employ a quantity surveyor. The payment is as much an illicit commission as if it were paid by a tradesman, although a specious defence is sometimes advanced by those who receive it on the score of custom. It is not that the surveyor is paid less for his work; the extra charge comes indirectly out of the client's pocket.

It is the architect, as the client's agent, and not the client himself, who employs the surveyor, and the latter is therefore largely dependent on the architect for his work. The same may be said of the builder, as it is usually the architect who invites him to tender. The client meantime, who is entirely ignorant of the preliminary methods of procedure in building a house, is often left in the dark by the architect even of the very existence of the quantity surveyor, and as the latter is paid not by the client but by the builder, there is no very evident way by which a client should get to know of his existence, or that he had been indirectly paying him through the builder.

Now, while I would most carefully guard myself from implying the slightest motive of dishonourable practice in thus keeping the client ignorant, I do say that the present system of an architect, practically on his own initiative, employing a surveyor, and the latter receiving payment directly from the builder, so that the amount of that payment is hidden in the builder's charges, is one which might readily lend itself to the practise of dishonesty and fraud. I do not say that the fraud exists, but that when the means for fraud exist without the likelihood of discovery, there is a probability that someone will sooner or later be found to avail himself of them.

The wise architect will explain everything to his client in the fullest detail at the very first. He will explain the functions of the surveyor, and mention the name of the one whom he proposes to ask. He will state his charges. He will also explain that if the building is not proceeded with the surveyor will none the less be entitled to his charges in full. And he will also consult his client as to the builders who should be asked to tender. And I think it would be wise if he arranged that the surveyor should be paid by his client direct. It may come to the same thing in the end, but in an evil world one must consider appearances.

It is only by the utmost frankness on the part of the architect, combined with loyalty and justice towards client and builder alike, and associated with the most assiduous care in

sparing his client unexpected or excessive expense, that that distrust to which I have referred, and which undoubtedly does exist, can be removed. That is a consummation devoutly to be wished. It devolves upon each architect individually to assist in its realisation.

Mr. Osborn Smith said he was present that evening because he expected to hear a very interesting paper, and he had not been disappointed. Mr. Bidlake had put his finger on certain defects in the architectural profession which he thought ought to have been pointed out before, and he was prepared to endorse the remarks the reader had made. One of the first items he heard was an allusion to the difficulty the average client had in understanding the vast amount of knowledge put on paper in relation to drawings. He himself took every opportunity he could of deluging his clients with drawings when necessary. In this way a difference would be seen in such a work as a house when put up by a speculative builder and one erected after the design of an architect. As regarded irregular commissions, there were undoubtedly quantity surveyors and architects who shared, but he had never come across them. The system was dying out, but he was bound to make an exception that it was much more prevalent in the provinces than in London. It could not apply to first-class surveyors, and even second-class, in London. It was not the custom, so far as his experience went, to pay architects in proportion for taking out quantities. If the drawings were prepared properly there was no occasion for an explanation regarding the quantities. The only remedy for indefinite plans was that they should be developed before they were put into the quantity surveyor's hands. If everything was made clear to the client, and he was told at an early date that such a person as the quantity surveyor did exist, a lot of distrust would disappear. He had much pleasure in proposing a vote of thanks, and was extremely glad such a good paper had been read before the Association.

Mr. Banister F. Fletcher seconded the vote, more especially as he differed on several points. Why should the public be ignored? Too much should not be expected from them, considering that architecture was one of the most difficult questions to understand. Even if the architect was looked to for guidance he was often found to be quite ignorant on the subject. New revivals might be said to be due to this ignorance. Proportion was a subject they knew little about. It was innate and could not be solved by the rule of thumb. The right use of materials seemed to him the very last thing the public would learn anything about, the study being very laborious. It was a question of a little knowledge being a dangerous thing. The more the public knew about a certain form of architecture the worse for it. The knowledge of form could not and would not be reasoned out of them. As regarded the payment by percentage it was not an ideal way of working, but it was a definite way and could therefore be understood by outsiders. It would be impossible to work out a building entirely on paper, so that it was almost out of the question to build without extras. The subject of commission was one that could hardly be treated in a paper of the present description. It did not affect the public and he thought it did not go on to the same extent as Mr. Bidlake had expressed, at least not in London.

Mr. H. W. Pratt also stated he was not aware that the question of sharing commission was so general as Mr. Bidlake had made out. For himself, he was dead against such practice, and wished architects would look at it from a conscientious point of view. Then, if the commission was not sufficient as had been first agreed to, let the architect go direct to the client and explain the case openly. Clients never had an idea of the amount of work involved respecting details in drawings, and it was sometimes believed that the architect made use of his competition drawings as working drawings. If a little more business capacity as regarded finance was put into the work he thought extras would be reduced, in fact found unnecessary. A man who sat down and thoroughly worked at his drawings need never go beyond any extras he had calculated. A close ring, composed of the quantity surveyor, architect and builder he had never heard about before, and thought it would create a false reputation of all three, but he hoped Mr. Bidlake, after hearing the discussion, would go away with the impression that in London they knew nothing about it.

Mr. E. W. Mountford thought the paper had rather brought into prominence things which might exist, but only in a comparative degree. He could not imagine that there was such a thing as the ring of which the quantity surveyor, architect and builder formed parts. Of course, builders were honest men, but looking at things from a different point of view, they meant to do good work, but then came the question of profit. They were entitled to a fair profit, but then builders differed on this point; 10 to 15 per cent. was a fair profit, but anything beyond this it was the duty of the architect to stop. The accepting of commission might be true to a certain extent. He (the speaker) always made the invariable rule that when commission was offered his connection with that firm ceased. In the past it

may have been a common custom, but he could not think now men would accept illicit commissions.

The Chairman said they had to recognise a fact which would clear the ground. Architects were never paid for the design, and the client did not understand that there was so much work and time spent in designing. The young architect was liable to sacrifice everything in order to get an idea of his own embodied in stone, and under these circumstances it could not be expected that a client would put up with all work. The client might even imagine the architect ought to pay him for being allowed to express an idea of the Renaissance. Architects were employed to carry out the ideas of clients, and yet the former took the opportunity for carrying out their own. This ought to modify their idea of the public. The adjudication of competitions was unsatisfactory. Why should not the decision rest with the competitors? But failing this, the Royal Institute of British Architects should adjudicate in any competition without charge, and this would be a great gain to the profession at large. As regarded estimates, they should learn to please their client and not to run into artistic fads at first. The client's reasonable wishes should be satisfied, and nothing ought to be started before everything was clear to one.

Mr. Bidlake said he did not wish to speak disrespectfully of the British public. He had a great pity for them, and, if they were ignorant, it was their misfortune and not their fault. Extras could be avoided on a large scale—not altogether perhaps. An architect who was constantly picturing the building should be able to picture the various parts of it, and thus he might be reasonably expected to know before the foundations were built. There was a distrust on the part of the public regarding building, and, if architects dealt frankly with their clients, it might disarm suspicion. There was, undoubtedly, the risk of a ring existing quite unknown to the client. The quantity surveyor, builder and architect could make arrangements by which higher fees would be obtained. There was a possibility of fraud, and when such a possibility existed some would be found to take advantage of it.

It was announced that at the next meeting on March 5 Dr. F. S. Granger will read a paper on "Greek Sculpture and Greek Legend."

### THE PHILÆ TEMPLES.

IN Lord Cromer's annual report on Egyptian affairs is found the following passage concerning the Philæ temples:—The work of excavating the temples at Philæ was completed in April 1896. The débris has been carefully removed from the whole of the area enclosed by the two colonnades, as well as from the open spaces to the south of the colonnades. The site of a Temple of Augustus at the north of the island and a small unfinished temple near the Kiosk were also excavated. Subsequently the Coptic village, which covers three-quarters of the island, was laid bare, the walls, stairways and doors of the dwellings being left, while the streets and interiors of the houses were cleared from the rubbish of fallen roofs and walls which encumbered them. To the great Temple of Isis nothing has been done beyond clearing out the crypts which were choked with rubbish. The foundations of all the principal buildings were examined by sinking holes to their bases. In every case the foundation masonry was found to be in a sound condition and extending to a great depth below the surface of the ground. No sign of any settlement was visible, although the infiltration water had saturated the subsoil in every direction. The main Temple of Isis is founded upon the granite rock. The only instance in which serious deterioration of the stone was observed was at the bases of the columns of the eastern colonnade, which were buried in the rubbish of the Coptic village. Here the contact with the salted earth had caused considerable corrosion to the stone. This portion of the buildings has now been restored. Repairs have, however, been as few as possible and have been limited to replacing dislodged blocks and drums of columns. Other fallen stones belonging to each separate structure have been collected together, numbered and catalogued. Great progress has also been made during the past year in the work of preserving the Karnac temples. The engine and pumps presented by the Egyptian Exploration Society proved of the greatest utility.

### THE NATIONAL TRUST FOR PLACES OF HISTORIC INTEREST.

A MEETING of the executive committee of the National Trust was held at No. 1 Great College Street, Westminster, on Wednesday, 17th inst., Sir Robert Hunter in the chair. It was determined to take steps to initiate a regional survey of the country, and by means of local correspondents initiate the compilation of a catalogue of buildings, objects and places of historic and archæological interest, with a view to their proper protection and preservation. Such a work is

urgently needed in this country, and it is hoped that it may eventually be possible to obtain the recognition of the Government and its aid in the performance of such duties. A report by the treasurer showed that the work of repairing and making sound the old clergy-house at Alfriston (which has recently been acquired by the Trust) had had to be suspended on account of lack of funds; a sum of 200*l.* is still needed to put this interesting edifice into a proper state of repair. It was announced that the purchase of the cliff situated opposite Tintagel Castle in Cornwall (which has been recently acquired by the Trust), was now complete. This fine headland, comprising 14 acres of down, is now, therefore, in the hands of the Trust, the property of the nation for ever. The secretary was able to report that the circular issued by the Trust, in conjunction with three other societies, suggesting the acquisition by local authorities throughout the country of a piece of land or place of historic interest or natural beauty as a "Victoria Open Space" in commemoration of the Queen's long reign, had aroused wide-spread and sympathetic interest.

Finally, the committee were unanimous in agreeing to resist as strongly as possible the Hastings Harbour District Railway Bill, on the ground of the serious interference to which it will give rise with the most charming features of natural beauty in the district.

### TESSERÆ.

#### The Arts and Queen Elizabeth.

THE prejudices to which the zeal of the Reformation gave birth against painting and sculpture and their consequent state of humiliation in England has been but too sensibly felt by artists. Among prejudices can be comprised that of false judgment of the value of the art, not formed on a rational consideration of its real qualities, but first imposed by casual circumstances, and afterwards, by their continuance, grown into habitual opinion. Of the state of these opinions soon after the time mentioned as the era of their commencement, an idea can be formed from the words of Stow, who wrote his annals in the reign of Elizabeth:—"Of the art called of Aristotle graphice, and in English paynting, there be in this citie cunning masters for either shadding, pourtraying, counterfetting, tricking, paynting, enlumining or limning. But this is an art now not accounted ingenious or fit for a gentleman, by reason that it is much fallen from the reputation which it had aunciently; which, whether it be for the unworthinesse or unskilfulnesse of the persons exercising and practising it in this age, or for the abuses and deceipts used by paynters, or for the scandall of images and idols . . . or for what other cause I know not well; but sure I am, it is now accounted base and mechanically, and a meere mestier of an artificer and handy craftsman. Insomuch as fewe or no gentlemen, or generous or liberal person, will adventure the practising this art." This statement may appear to many too severe, and even exaggerated. There are some instances of regard shown to painting at various periods after the Reformation; and Elizabeth herself, although issuing her injunction against all pictures in churches, seems at other moments to have been inwardly desirous of protecting them. But the general aspect of the arts after the Reformation is correspondent with the account here given. The change which they suffered in public opinion, from the honour with which they had been formerly treated to the degraded state in which Stow reports them, and to the light in which they were then generally viewed, is certainly very striking. Stow's defence of painting, immediately following, is scarcely less singular:—"But inasomuch as Aristotle recommendeth it to his statesman or politician, and because it is numbered among those arts which are necessary for a gentleman and for a courtier, by Count Baldassar, and in regard also that the heraulds (who be gentlemen by their places) must be skilful in this art, I must preface somewhat in the defence or excuse of it."

#### Sir J. Reynolds as a Painter.

Reynolds stands distinguished as a great painter because his mind discerned and his skilful hand displayed the expression and feelings of nature in every various stage and condition of life. He sought and disclosed every grace of youth and beauty; he gave dignity to the noble, respect to the matron, innocence and mirth to the child. His pictures frequently reflect back the strong impression made on his mind by the eminent beauties of former great masters; and the attitudes of his figures, as well as the ideas of his compositions, are sometimes evidently borrowed from others; but his powerfully combining mind rendered everything which he touched his own. In portraiture, Reynolds, no less than Titian himself, excelled in the due and skilful selection of the appearances which nature holds indiscriminately forth to view. With him, not every peculiarity, not any vice of incidental habit, affectation rarely, deformity never, were requisite to produce the complete likeness of the person who sat to him. He excluded the transient and stamped on his canvas the permanent character

of the countenance; he painted the mind; and it is by these distinguished powers of perception and expression prevailing over every other excellence of his works that his superior eminence as a painter is finally established. As an historical painter it cannot be denied that Reynolds remained imperfect; and it is not now to be calculated what might have been his accomplishment of that province of the art if youthful competition had conducted him to it and if opportunity had been presented to foster his exertions. Who shall say to what disclosure of his mind the proposed plan of adorning St. Paul's with scriptural subjects might have roused him? His powers of conception occasionally, and of execution always, appear to have been equal to the highest enterprise. The fame of Reynolds is acknowledged worthy to have mixed with that of the proudest name that has ever adorned the records of our history. But he shines in solitary glory. Phidias, illustrious as the sanction of ages has made him, borrowed splendour from the favour of Pericles, under whom he rose, and Raphael from that of Julius II. and Leo X. The fame of Apelles became tributary to Alexander, and that of Titian to Charles V. The English painter had no patron. The coldness or the magnanimity of State neglect has left to Reynolds undivided honours.

#### Thorney Island, Westminster.

It was about 470 yards long and 370 yards broad. On the east it was washed by the Thames, a branch of which entered at Canon Row, or as it was probably called from this cause Channel Row, almost close to the south wall of the Privy Gardens, and at the east end of Manchester Court, then running westward, it intersected King Street and flowed down Gardener's Lane, from the west end of which its course ran to the south by a moat called Long Ditch, by the present line of Princes and Delahay Streets. The stream crossed Tothill Street to the west of the Gatehouse, and sweeping to the east continued its way under the south wall of the infirmary garden in College Street, and so fell again into the main stream. This island comprised the precinct of the Abbey and Palace, which were further defended by lofty stone walls, those on the east and south of the college gardens being the last remains of such defences of a later date. They were pierced with four gateways—the first in King Street; the second near New Palace Yard, the foundations of which were seen in December, 1838, in excavating for a sewer; the third opening into Tothill Street; and the fourth near the mill in College Street. The precinct was entered by two bridges. One crossed the water of Long Ditch at the east end of Gardener's Lane, having been built by Queen Matilda, the consort of King Henry I., for foot-passengers; the other was situated at the east end of College Street, underneath the pavement. It connected Millbank with Dirty Lane.

#### Ancient Spires.

Of Norman pyramidal spires England cannot now produce one single specimen. The towers of Southwell in Nottinghamshire were once surmounted by two such spires, and Rochester Cathedral before the innovation by Cotingham presented to us a venerable low plain spire covered with lead, which, though not perhaps of Norman date, was probably coeval with its base of early English structure. Low conical cappings are still also to be met with on the tops of turrets, as fortunately yet at the west end of the interesting building just alluded to. Bentham has stated that the first spire built in this country was that of Old St. Paul's, and Dugdale says a clocher or tower for bells was finished there about the year 1221. But whether he alludes to a detached campanile which stood in the northern part of the churchyard and was pulled down in the time of Henry VIII., or to the spire which surmounted the central tower of Old St. Paul's, it is not easy to determine. If we may credit the etching by Hollar, this spire, the highest in Europe, was octagonal, and appears if coeval with its tower, which had the lancet windows of the thirteenth century, to have been equally subjected with the south door and other portions of the old foundation of King Ethelred to the barbarous incongruities of Inigo Jones and his coadjutors in the expulsion of our estimable English architecture.

#### The Iron Age in Denmark.

Antiquities from the Stone and Bronze period occur very plentifully in Denmark and the south-west part of the present Sweden, but very rarely or only in single specimens in the other parts of Sweden and the whole of Norway. With regard to the objects from the Iron period the circumstances are wholly reversed. The swords and other weapons characteristic of that period, the oval clasps for the breast, the mosaic beads, &c., are so common in Sweden and Norway that traces of them are discovered in nearly every barrow which has been examined there; on the contrary, in Denmark (with the exception of Bornholm, which in an antiquarian point of view is connected with Sweden) they occur but very rarely indeed, when compared with the objects of stone and bronze. In places of historical note, for instance, as Leire and Jellinge, which we must con-

sider as having been tolerably well peopled in the Pagan times, swords and trinkets belonging almost exclusively to the Bronze period alone have been exhumed, but none from the Iron period, although numerous graves in the neighbourhood have been opened. This can scarcely be a matter of accident, since the Royal Museum of Northern Antiquities in Copenhagen, which during a series of years has received accessions from different parts of the country, and from many hundred barrows, possesses only a very few weapons of iron which are known to have been found in heathen graves, while, on the other hand, it exhibits several hundred swords and daggers of the Bronze period.

#### GENERAL.

**Lady Wallace** has presented the invaluable collections belonging to her husband, Sir Richard Wallace, to the nation on condition that they are kept in a special museum unmixed with other examples of art.

**The Members** of the Architectural Association, by courtesy of the architect of the County Council, Mr. Blashill, have paid a visit to the large scheme of improvements being carried out in Shoreditch. Mr. Owen Fleming conducted the visitors over the buildings, and gave a short address embodying the main points of the scheme. The members of the Association then inspected the buildings, which are in various stages of completion. Great interest was shown in the workmanship of the works department.

**The Members** of the Edinburgh Architectural Association met on the 17th inst. in the Royal Institution, Princes Street, Dr. Rowand Anderson, president, in the chair. After the transaction of formal business, Mr. Henry F. Kerr read a paper upon Elgin Cathedral, illustrated by limelight views.

**The Society of Antiquaries**, on the motion of the Rev. G. W. Minns, seconded by Sir Samuel Montagu, Bart., M.P., have passed a resolution urging upon the local authorities of Southampton the importance of preserving ancient landmarks of historic interest while the scheme for the removal of certain dilapidated buildings to insure the sanitary welfare of the borough is in progress.

**Sir J. Blundell Maple, M.P.**, has promised to rebuild and extend to three times its present size North London, or, as it is better known, University College Hospital, in commemoration of the Diamond Jubilee. The cost will amount to 100,000*l.* or 120,000*l.* The plans for the new building have been prepared by Mr. Waterhouse, R.A.

**The Next Ordinary Meeting** of the Liverpool Architectural Society will be held at the Law Library, Union Court, on Monday, March 1, at 6 P.M. prompt, when a paper will be read by Mr. W. E. Willink, entitled "Mediæval Trade Guilds," with limelight illustrations.

**Professor F. M. Simpson**, of University College, Liverpool, delivered a lecture in the Corporation Galleries, Glasgow.

**Mr. Matthew Webb** will read a paper on "Gesso" before the applied art section of the Society of Arts on Tuesday next.

**M. Chaucard**, the owner of Millet's *Angelus*, has given 29,000 francs for a drawing by Moreau le Jeune out of the Goncourt collection. The subject is a review of troops by Louis XV.

**M. Edouard Garnier**, the conservator of the Sèvres Museum, has completed a new catalogue of the collections under his charge, which contains about 700 pages, with reproductions of marks, monograms, &c. It is a true history of faïence.

**Mr. Philip E. Pilditch** (Messrs. Pilditch, Chadwick & Co.), architect, surveyor and valuer, has, in consequence of the projected demolition by the Government of Parliament Street, where the firm has practised for the past twenty years, removed to No. 2 Pall Mall East, Charing Cross.

**The Second Visit** of the session of the Edinburgh Architectural Association takes place to-morrow, and will be to the North British Distillery, Gorgie Road.

**Mr. A. T. Cooke**, of Worthing, is the architect for the important additions which are about to be carried out in the existing assembly-rooms of that town, a company having been formed for the conversion of the building into a modern theatre. The alterations will be of an extensive character, and will comprise the erection of a new stage and proscenium, a dress-circle, and the building of a large hall for dances, banquets, &c., with a handsome frontage to Bath Place. It is hoped that the work will be finished in July next.

**Lord Derby** opened on the 20th inst. a village hall which his lordship has presented to the village of Knowsley. The building, which has been erected by Mr. James Pilkington, of Rainford, is in a convenient situation immediately fronting the church and schools. Lord Derby laid the foundation-stone on May 29 last year.

**We have** been requested to announce that the Lord Mayor has consented to open in State the National Building Trades' Exhibition at twelve o'clock on Saturday, March 20.

# The Architect.

## THE WEEK.

THE exquisite ornamentation of Celtic manuscripts has been a surprise to modern designers, and so competent an authority as the late Sir M. DIGBY WYATT admitted he was puzzled with some of the effects. An explanation of the process employed has been given in Dublin by the Rev. Dr. BERNARD, one of the Fellows of Trinity College. He said that no modern vellum was equal to the best specimens of the vellum of the Middle Ages. In Ireland and England the parchment or vellum used was, as a general rule, thicker and heavier than that used in France and Italy. The Irish ink was very black and almost indelible, and seemed not to be made of substances now in use for the purpose. Reeds were first used for writing on vellum, and quill pens afterwards. It would be interesting to know what the actual value of such work executed by scribes would be, but unquestionably in the pre-commercial period these books could not be written for money. Mr. BERNARD might have added that, however excellent the vellum and colours employed, the Celtic scribe was occasionally as careless in his work as any modern member of a trades union. The Irish school of illumination was described by Mr. RUSKIN as without a rival, and seemed as if it might be advanced to the highest triumphs in architecture and painting. But it had one flaw; it was incorrigible. As evidence, Mr. RUSKIN referred to a figure of an angel by an Irish missal painter, who in happy complacency put red dots into the palms of each hand and rounded the eyes into circles, but left out the mouth. That arrested development Mr. RUSKIN considered was indicative of points of character which still diminish the national power of Ireland.

In Scotland papal relics might not seem to be of much interest, but Dr. ROWAND ANDERSON was on Tuesday enabled to fascinate the Students' Union of St. Andrews University with a cast of the head of Pope BENEDICT XIII. His Holiness when at Avignon in the early part of the fifteenth century received HENRY WARDLAW, who came on a mission for the purpose of obtaining facilities for the education of Scottish students in their own country instead of in foreign schools. The Pope gave encouraging sympathy to the project. In order to aid in its restoration HENRY WARDLAW was appointed bishop of St. Andrews and papal legate in Scotland. WARDLAW was able to gather a staff of honorary professors, and he opened a wooden building known as the Pedagogue, which was the first college in St. Andrews. In 1412 the Pope granted a charter conferring on it the privileges of an university. BENEDICT was afterwards deposed by the Council of Constance, and then retired to the castle of his family, the LUNAS, at Peniscola, in Spain, where he died. He was buried in the chapel, but six or seven years afterwards his remains were removed to Illueca, in the province of Zaragoza. Dr. ROWAND ANDERSON having visited Illueca found that DE LUNA's family had specially constructed a small chapel to receive the body of the Pope, and it lay there, surrounded by twelve lamps kept constantly burning, till the year 1536, when the chapel was closed. A priest went in and said mass for the repose of his soul. This act was condemned by the Church, as it was unlawful to pray for the soul of a heretic. It remained built up till in the year 1810 the French overran the country on their way to the siege of Zaragoza. The castle was sacked, and the chapel broken into in the hope of finding treasure. Indignant at finding nothing but the mummified body of an old man, the soldiers threw the body out of the chapel, and it was broken up. Part of the head was all that could be recovered, and it was then taken to Savinan, about nine miles from Illueca, and deposited in the house of the Conde DE ARJILLO, one of the collateral descendants of BENEDICT, and there it still was. All that was mortal of this most eminent man was now enclosed in a small, shabby wooden casket. The head is not merely a skull, it is a mummified head. One could see the

configuration of the head, which was very deep, the brow low but wide, the eyes deep set; but the most striking feature was the very high and prominent nose. The lower jaw was unfortunately lost, but from what one saw one could imagine a face keenly intellectual and highly sensitive, refined and distinguished, a face to command respect and admiration, indicative as it was of loftiness of sentiment, of nobility of character and of uprightness of life. Dr. ANDERSON obtained permission to take two modellers with him when he visited Savinan and to bring away a cast of the head. At the close of the lecture Dr. ROWAND ANDERSON presented the Students' Union with the cast. Principal STEWART made a suitable acknowledgment.

THE question of ownership of plans rarely arises without giving rise to unnecessary acrimony. At Margate the School Board have had a wordy contest over the subject. A school was lately completed from the designs of Mr. DALBY REEVE to the satisfaction of the Board, but when it was proposed to pay him the balance of his fees it was made a condition that the cheque should be held until the plans were delivered. One reason given was that so long as Mr. REEVE retained the plans any new work at the schools would have to be given to him. Some members considered the stipulation was not fair to an architect against whom there were no complaints, but after an angry discussion the resolution about retaining the cheque was adopted by a majority of two votes. It is to be regretted that in all such cases law is not distinguished from custom. Unless there is a clause to the contrary, the architect, so long as he is regarded by the courts as the agent of the building owner, cannot uphold a claim to the retention of his plans after all his fees are paid. But as a rule plans are not demanded by the building owner or employer, and in very few cases has any inconvenience followed from allowing the architect to preserve them. In the Margate case if a new architect had to be employed to carry out additions, he would not be likely to accept a lower rate of commission if the Board could allow him to refer to the original plans.

ACCORDING to the British Consul there are several qualities of very good marbles in the province of Verona of variable tints between the red-purple and red-yellow colours. The most esteemed are those called Broccatello and Nembo, which are obtained from the mines existing at Sant' Ambrogio di Valpolicella and Fiumane. The red marbles of the Commune of Grezzana for flooring and decorative purposes are also in great demand, as well as the stones coming from the quarries of Bosco and Chiesanuova. There are also quarries of fine marbles in the Communes of Caprinico Veronese, Prun and Torri del Benaco. The cost of the marble is moderate and varies according to the quality and quantity ordered. There is a considerable exportation of such marbles to America, Great Britain, Austria and Germany, but the greatest part is used in the interior. There are also numerous quarries of hard stone and tufa in the said province, which are used for building and other purposes.

THE restoration of the pinnacles and battlements of St. Mary's Church, Oxford, was again considered on Tuesday. Professor CASE proposed a return to the plans originally proposed by Mr. T. G. JACKSON in 1892, and accepted by the council, which were not only historically and architecturally preferable, but would result in a considerable economy of money. The President of Trinity pointed out that the House was incompetent to discuss questions of architectural detail, and deprecated the practice of heckling their architect. Opposition on economical grounds he sympathised with, but if the work was to be done at all it should be done well. Mr. HENDERSON asked what Professor CASE would think if Congregation were called on to decide by decree some debatable question in moral science. Finally the amendments were rejected by thirty-five to nineteen, and we suppose there will be no further obstacle to the realisation of Mr. JACKSON's later designs.

## EAST SUTTON CHURCH, NEAR MAIDSTONE, KENT.

BY THE REV. J. CAVE-BROWNE, M.A.

THE spirit of church restoration is indeed in the air. It is permeating the whole country. Not only our cathedrals and larger parish churches, but the smaller ones too, in retired country villages, are being affected by it. The zeal and energy of the laity, in co-operation with their clergy, are verily effecting a revolution. The little village church of East Sutton, near Maidstone, is a pleasing illustration of this. No one who has chanced to see this building within the last few years (say a year or so ago) can fail to be struck with the wonderful change which has lately come over it. It now presents a welcome example of what a conscientious restoration of such a building can produce—and a noteworthy example too. Instead of everything old and out of repair being summarily swept away to make room for “modern improvements” (?), every feature long since well-nigh obliterated, every trace of Mediæval art long buried beneath layers of mortar and whitewash and paint, has been carefully uncovered and brought to light.

It is but a short time since the entire area of the church was crowded and blocked up with high pews of painted deal, comfortably cushioned and hassocked; the walls smoothed off in plaster, once perhaps white, but then toned down with waterstains and mildew and moss; the windows partly bricked up at the bottom to save the expense of re-glazing; the mullions too bulging out of the perpendicular, and threatening to fall; while over all spread a barrel-like ceiling of plaster and whitewash, everywhere betraying signs of leakage through decaying lead. The font also, judiciously thrust out of sight, seemed but little more than an octagonal mass of mortar. The whole church looked as if utterly uncared for and forlorn.

Happily for the parish it had as its churchwarden a man (who we hope will forgive our mentioning his name), Mr. W. R. WARD, who was deeply imbued with the sense of veneration for what is old, and the faculty for appreciating ecclesiastical art. It has been almost entirely through his persevering zeal and untiring energy that this now graceful little church has been restored to almost its pristine beauty. The pews have disappeared and the entire area is covered with open seats of oak, while all round the range of the side walls has been brought to light a line of stone seats with moulded edges. The walls, stripped of their countless coats of mortar and whitewash, have disclosed their long hidden treasures of Mediæval skill and taste. In the little chancel, now relieved of its cumbrous monuments, which have been judiciously placed elsewhere, appeared in either wall a window of which not a trace was visible from within, with jambs and soffits more or less complete. That on the north retained its original form, and has now been filled in with stained-glass presented by Mr. LAVERS, of the firm of LAVERS & WESTLAKE; that on the south side had evidently been partially blocked up when the south aisle, known as the Filmer Chapel, was added. While the arch itself and the upper portion of the window was closed, an opening, either as a lychnoscope or squint, was left open at the base, which has been carefully preserved. A piscina too and an aumbry were discovered in the chancel, and restored; as also in the adjoining Filmer Chapel.

In the north wall of the north aisle was found a beautifully moulded doorway opening into a newel stair in the buttress which led to the rood-loft, of which the entrance door remains. Of the rood-loft itself only portions were found, which had been in a spirit of the grossest vandalism utilised for ornamenting the sides of the family pews. Then the font, which has been described as seeming to be little more than a mass of mortar, has been restored to its pristine form, with apparently a Norman base and four rounded columns supporting an octagonal bowl of Kentish ragstone, having on each alternate face a slightly recessed window tracery of the fourteenth century.

Perhaps the most choice, as it is the most conspicuous, object inside the church, is the western arch leading into the tower. Here, as elsewhere, the thick mortar, which for a time overlaid it, has helped to preserve the graceful mouldings of the jambs and arch, which tell of the fourteenth, if not thirteenth-century work. And lastly, the little

porch on the south has revealed its long hidden treasures in the form of two small windows, one in either wall; these have been carefully restored and filled in with glass, representing the two patron saints of the church, St. PETER and St. PAUL, one on either side. And on the right hand of the entrance door is opened out the stoup for holy water, in good preservation.

Thus is the whole aspect of the church changed. From being a desight and a disgrace, it has become an object of beauty and justifiable pride. The question naturally suggests itself, “How has all this been brought about?” The parish is very small, and by no means wealthy, while, like so many of the grandest estates in the county, Sutton Place, the mansion adjoining the church, has for some years been occupied by a succession of tenants who have no ancestral, and very little personal, interest in the parish church. The metamorphosis which has taken place here may be mainly, if not altogether, ascribed to the persistent efforts of the churchwarden already mentioned. The patronage of the church, which is only attached to and little more than a chapel-of-ease to the neighbouring parish of Town Sutton,

EAST WINDOW, NORTH AISLE, SUTTON CHURCH.

or Sutton Valence, lies with the Dean and Chapter of Rochester, to whom it was transferred on the dissolution of the Abbey of Leeds by HENRY VIII. On a representation being made to that chapter, as being “rectors” of the parish, the energetic Dean HOLE made a personal inspection of the building. The appeal of those dilapidated windows, the leaky roofs, the sad state of the floor, the foul condition of the graves—for they were not vaults—was irresistible; and the Dean and Chapter recognised fully and freely their responsibility, and made a liberal grant towards the restoration, while the trustees of the Filmer estate also contributed handsomely. Thus the good work was started, and an interest created among friends and neighbours soon helped to swell the fund. But, the work once begun, every day seemed to bring forth fresh demands, as it disclosed fresh defects and fresh beauties. The dilapidated state of the walls rendered it necessary to remove all the mural tablets and monuments; and as step by step the workmen

went on clearing away the surface mortar, fresh discoveries were made. One after another the architectural treasures were being brought to light, each discovery stimulating further research; until the present results were attained.

While this was in progress, the deplorable condition of the east window of the chancel created a fresh demand. Here a very poor specimen of seventeenth, or perhaps eighteenth-century taste had been substituted for what the curves of the arch and the jambs which still remained showed to have been a graceful window of the Decorated period. This window, out of condition as well as out of keeping, was a painfully conspicuous eyesore, especially in the midst of so much beauty. This was mentioned to a widow lady who with her husband had at one time lived in the parish, and she offered to replace the window and to fill it with glass as a memorial of her husband. The design of the stonework was taken from a window of Merton College, Oxford, which was thought to correspond nearly with the original one, and the glass, representing the leading events in Our Lord's life, produced by Messrs. LAVERS & WESTLAKE, has now been inserted.

Although so much has been done, and so well done, more still remains before the church can be said to be perfectly restored. At the east end of the north aisle is a beautiful specimen of Decorated tracery, a window of repute far and wide, and in the north wall of the same aisle one of almost unique character, containing some striking Flamboyant tracery. But both of these windows are in a deplorable state of decay; the mullions are out of the perpendicular, the tracery crumbling away, and the whole threatening to collapse. It is to save these that the enthusiastic churchwarden is now pleading for funds. He appeals to those who love Mediæval art—to archaeologists generally—to come to the rescue. Such gems should not be suffered to perish. Who will help to save them?

#### THE PROSPECTS OF BUILDING.

THE oldest architect or contractor in Great Britain would not be able to recall a time when so many projects of building were announced as within the past few months. The number, too, is likely to be increased. There is, however, nothing surprising in so general a desire, for it was anticipated. The year 1897 is deserving of celebration as marking not only an auspicious event, but one that is almost without precedent. There are few kings or queens in ancient or modern times who have reigned for sixty years, and fewer still whose reigns could be considered as continuous incentives to loyalty. The British Empire has had many reasons for satisfaction through escaping from the general lot of nations, and may well congratulate itself on possessing a Sovereign of whom it has been truly said, "A thousand claims to reverence closed in her as Mother, Wife and Queen." It is a privilege to have lived on an occasion which may be considered as unique, and it is no wonder that in obeying an instinct which seems as old as the human race, there should be a desire to set up memorials which shall testify to the feeling that is so general in the present time.

The very depth of that feeling is suggested by the character of the proposed memorials. On an ordinary occasion we may endeavour to imitate our more volatile neighbours and erect a statue, although we know by sad experience it will neither be a thing of beauty nor even a temporary joy. But on exceptional occasions the nature of our race must be expressed, and as we prize our men and our institutions, our Church as well as our Government, for qualities which can be turned to account for the good of the public or of individuals, so in memorials that can be considered as national we expect the quality of utility to be paramount in them. Now and then a case of noble extravagance is tolerated, as in the Hyde Park memorial, but, rightly or wrongly, it is believed that a great reputation cannot be more worthily represented or preserved than by some creation which recalls the object by its beneficence.

The general desire to commemorate Her Majesty's reign by buildings is therefore a testimony of the affection of British subjects, and should accordingly be encouraged. In saying so we trust that nobody will consider we are undervaluing sculpture. There are times when an amor-

phous figure may serve as a record, for apparently the latest representation of JOHN BRIGHT remains unbroken; and although the likeness of himself which the Duke of WELLINGTON loved to contemplate from his windows could not be tolerated in London, it has found a refuge at Aldershot; but the sculptor's art on an unusual occasion like the present is most fitly employed when it becomes subservient to architecture. Let us have reliefs and statues if they are considered necessary to express the character of memorial buildings to future generations, but the sculptor who is most eager to be in unison with the spirit of the time would allow that a simple word such as "Victoria" or "Queen" or the date "1897" would be adequate to suggest why those buildings exist.

The sincerity of the feeling which will make buildings indispensable for commemorating the current year is further suggested by one remarkable circumstance. Amidst the countless projects which arise in cities and towns, there are many which signify local needs. The changes in the relations between various classes of people, the new requirements which follow an extension of education and a diffusion of a knowledge of sanitation, and the exigencies which modern theories of sociology create, give rise to buildings of kinds which were unknown a generation ago. Who could then have imagined that public reading-rooms would be opened in the busiest parts of the City, or that an East End vestry would expend 70,000*l.* in public baths, or that art galleries would be established in provincial towns? Refinement, physical exercise, entertainments, have to be provided at the expense of ratepayers. If a large provincial town will establish a band and a concert-room, smaller towns will long for similar luxuries. Accordingly, among the buildings which are proposed there is much variety. But from a comparison we have made among the projects, it seems to us that the class of buildings which is most generally sought may be described as one for the solace of bodily pain, such as hospitals, infirmaries, convalescent homes, &c. There is an appropriateness in the selection. They are all suggestive of woman's help, for when, as the poet says, pain and anguish wring the brow, the most whimsical woman becomes a ministering angel. How can a woman's reign be more fittingly celebrated than by creating opportunities for the exercise of feminine devotion to duty? It should also be remembered that such institutions derive little support from public funds. They have to depend on the liberality of individuals, and by creating them now there is no departure from the ordinary course of philanthropy. That is likewise an advantage.

The kind of building to be selected must of course depend on the circumstances of the locality and cannot be defined. It is impossible to erect one that cannot be turned to account, although the original purpose may have to be altered. But it cannot be too strongly impressed on committees and other authorities that some expedition should be displayed in the preliminary engagements. It may not be feasible in every case to imitate the action of Sir BLUNDELL MAPLE, who has made himself responsible for the immediate payment of 120,000*l.* in order to have University College Hospital erected. But in that promptitude we can see the act of a thorough and most successful man of business. He knows that shilly-shallying never leads to prosperous results, and having decided on a course of action he resolves to deprive himself of the opportunity to revoke. It would be of the greatest advantage if a similar course of action were followed with all memorial buildings. Architects require time to prepare plans, surveyors for taking out quantities, and builders cannot prepare their tenders without a tedious process of calculation. In each case there may be hurry, and architects, surveyors and contractors are prepared to make a sacrifice of their convenience, but it is always well to remember that more or less deliberation at the beginning of arrangements for a building often removes obstacles to its satisfactory completion. Although clients often think otherwise, plans cannot be prepared for several buildings simultaneously; in every one there are special conditions, and they cannot be met by stereotyped designs. If promoters of building projects will think over these facts they will be spared disappointment.

It is not always easy for architects to take the initiative, but we expect that this year there will have to be departures

from the usual procedure. As it will be supposed that all efficient practitioners are overwhelmed with commissions, and as there will often be no time for competitions, it will not be prudent to assume that the most eligible architect will be selected in every case without any effort on his part. The course to be followed must be settled individually, but there is likely to be often a risk that through a regard for the dignity of the profession by competent architects men of a different class may secure many a building.

As for contractors, there is no use in offering them advice. They have to depend on the caprices of their workmen, and it is much easier to foretell the condition of the weather daily during the summer and autumn seasons than to imagine what the British bricklayer, carpenter, slater, or plasterer will do a month hence. There are, too, the men who are not directly paid by the contractor, and who are also liable to be led astray. But their weakness can be provided against by laying in an adequate stock of building materials.

The manufacturers of materials, and dealers in them, will find they have also to grapple with an altered condition of affairs during the year. As we have said, there is not likely to be many competitions owing to the pressure of time, and for the same reason men who have to depend for business on architects can not expect to be always remembered when an opportunity arises to use their goods. Architects must be excused if they overlook past services and specify the goods of men who understand the occasion, and have brought themselves into notice in order to take advantage of it. This is not a year when architectural ability can afford to be concealed, and manufacturers and dealers must adopt the same course, and seek for publicity if orders are desired.

We cannot conclude without a word to another class who may not be supposed to be affected by the excitement of the time—we mean ordinary building owners. If they are prudent they will not lose a day in completing arrangements for the erection of any buildings they have in view. As we have pointed out, memorial buildings are likely to be started to an extent that is without precedent, and what with stipulations of contract, trade disputes, and the difficulty of obtaining manufactured articles and materials, contractors may be compelled to decline ordinary contracts. To obviate so unsatisfactory a possibility it is best to leave as little as possible to future contingencies.

## ELECTRICAL INSTALLATIONS.

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Continued from last week.)

### FITTINGS.

**Switches.**—It is one of the most important points in connection with installations that the switches should be of such a design that they do not arc or deteriorate rapidly, and that they are of ample size for their work. A good switch should be solid, and have large contact surfaces. The movable part should rub over the fixed part, as by this means the surfaces are kept clean, and there should be a considerable force pressing them together. The parts carrying the current should be massive, and there must be no signs of heating. The break should be long and quick in ordinary installation switches, and there should be only two positions in which the movable portion will remain, *i.e.* "on" and "off."

Main switches need not be very quick break; but the movement should be decided. They are seldom used when any heavy current is flowing, and consequently there is no danger of arcing. The contact surfaces should, however, be large, and the pressure between them heavy. These precautions are necessary, because main switches have to carry heavy currents, and are so seldom used that bad contacts are liable to occur.

Double-pole switches, if used, should be of as good design as single-pole, and extra care must be taken to insure that both poles are made and broken at the same instant, otherwise bad arcs may result. The insulation between the poles must be high, and this should be tested before fixing.

Switches in which the current passes through the pin or pivot are to be avoided, and all good switches are arranged so that this is not the case.

The base of the switch should have a high insulation, and no screws, &c., for fixing the brass contacts should be left projecting through the base at the back, but they must be countersunk and covered with some insulating material such as paraffin wax.

With reference to the material for bases, it is necessary that one be chosen which is strong, unflammable, not affected by moisture or high temperature and which is a good insulator. There are very few materials which fulfil all these conditions, and the materials used almost universally are porcelain and slate. There is a decided preference for the first-named amongst engineers. Slate has often veins of mineral ores running through it, and in consequence its insulating properties cannot be relied upon. On the other hand, porcelain cannot be worked, and all screw-threads, holes, &c., have to be moulded, and the material often warps during preparation.

**Fuses.**—The fuse and fuse block should be the subject of far more thought and be attended to much more carefully than at present.

The fuses so generally used, consisting of a piece of tin wire clamped under two screws, often without washers, are not trustworthy, mechanical or safe, and much annoyance is often caused by the sudden failures of the fuse, usually due to careless fixing.

The gauge of a fuse should be carefully measured and the fusing point tested under working conditions (screwed to the actual terminals to be used), and with the cover on. When this has been done the fuses can be inserted of the correct size with some amount of certainty.

The current at which a fuse melts increases with the sectional area of the wire, decreases with the length of the wire, and, if short (say  $\frac{3}{4}$  inch), increases with the surface and mass of the fuse terminals. The cover for the fuse box decreases the fusing current, and many other circumstances alter it. A great many of these objections are overcome by the spring-clip fuse, each size being of different length. This latter precaution is to prevent the larger sizes from being inserted into the low-current circuits and *vice versa*, but, all things considered, fuses are not altogether reliable.

Large fuses for main switchboards should be of sheet tin, stamped with the fusing current, and firmly clamped between two screw terminals.

The break between the fuse terminals required depends upon the current and voltage. The length should be more than the longest arc possible with double the standard current and voltage. Tables of the lengths of fuses under various conditions will be found in all books of electrical rules and tables.

Double-pole fuses should never be used, but two single-pole fuses, one on each pole, and separated by a distance greater than the break in each fuse. Double-pole fuses have been known to arc between the poles with disastrous results.

**High-voltage Fittings.**—When a pressure of more than about 110 volts is used, it is important that extra precautions be taken to insure that the fittings, switches, lampholders and fuses are properly constructed for the higher pressures.

The 200 to 220 volt systems now coming into use are perfectly safe if the necessary conditions are complied with. The break in fuses must be longer; terminals of opposite polarity must be kept further apart, the break of switches must be quick and long, all metal parts of the cover must be kept well away from all parts of the switch having the pressure on them.

The small arcing distance between the poles in lampholders has been one of the objections, and is overcome by sinking the metal parts almost entirely in porcelain, and the use of the clamp-screw terminals. The flexible cord is, however, still the weakest point in the circuit, especially near the terminals in the lampholder. Extra long and quick break switches, and in brass-covered switches enamelled liners, are used to prevent arcing to the cover.

There must be no fuses in ceiling roses or wall plug bases, or in any place where there are two poles together, but fuses may be inserted in a switch, as one pole only is used.

If care is exercised in these directions, and wires, fit-

tings, lampholders, &c., are protected from damp, there will be no trouble owing to the higher voltage. Higher voltage systems have an advantage over the usual 100 volt system, as any faults which occur are developed at once and burnt out, the fuse blown and the position at once indicated.

*The Wiring of Fittings.*—It is found that fittings are often sold of such a shape that wires cannot easily be drawn through, and it is perhaps advisable to obtain all fittings, which are complex, ready wired by the makers. This plan should only be adopted when the purchaser can thoroughly trust the makers, as bad work may be concealed very easily.

#### CABLES AND WIRES.

There appears to be a considerable amount of misapprehension on this subject, and it will perhaps be of interest to give roughly the properties of an insulator.

Insulation resistance is the inverse of conductivity, and this is the usual way of talking of the matter, because as a rule with a wire the conductivity is always made as high as possible, and with an insulator the conductivity should be extremely low, or, in other words, the resistance should be at the rate of many megohms per mile of cable. The sign  $\Omega$  is always used to denote megohms, *i.e.* millions of ohms; mistakes are often made when "megohms per mile" are mentioned, and it must be remembered that this expression is incorrect; as, if true, two miles would have twice the insulation resistance of one, whereas it has only half. In fact, the term "conductivity of the insulation" should be used, and then there would be no trouble; but unfortunately there is no recognised unit or word for  $\Omega$ . The important matter to remember is that the insulation resistance is inversely proportional to the length and to the circumference of the wire, and proportional to the thickness of the insulation and to the quality of the material. The usual insulation resistance specified for cables and wires for installation work is 500 to 800 megohms per mile, and there is very little advantage in increasing this beyond about 1,000 megohms per mile, as it is highly improbable that the contractor will use a higher class cable.

In rubber-covered cables vulcanised insulation should be insisted upon, as pure rubber is not waterproof enough, and it is better if there is a layer of pure rubber between the vulcanised rubber and the copper wire, as there is a chemical action between copper and the vulcanised rubber. All copper wires in rubber cables must be tinned, as the coating of tin will prevent the action referred to, and also it will be found very advantageous for the soldering of joints.

There are several other classes of insulation used now for wiring—the paper and the jute with resinous insulation, amongst others. With any cable in which a hygroscopic material is impregnated with oil of any description, usually resinous, it is necessary that a continuous water and air-tight sheathing be used. This usually is of lead, hydraulically pressed round the finished cable. The end connections on such cables must be well designed and carefully carried out (and the suppliers of the cable should be consulted in this), or moisture will enter and the whole length of cable may be ruined. Lead-covered cables, in which the insulation depends upon the continuity of the lead, should be armoured or enclosed in suitable mechanical sheathing when buried in plaster, to prevent injury from nails, &c.

There is a growing dislike against rubber cables for use in damp positions, as it is found that even rubber which is vulcanised will not withstand the action of being wet and dry alternately.

For such positions, if rubber cables are specified they should be lead covered, but lead-covered rubber cables are expensive, and are very little better than the lead-covered jute or paper insulated already mentioned.

Whilst speaking of lead-covered wire, it may not be out of place to mention another system of wiring in addition to the ones already noted. This is being introduced by Messrs. ALLINGHAM & FENNELL, and has most of the advantages of the concentric system, while it can be used on the public supply mains. The conductors used by them early in 1896 consisted of concentric lead-covered cable with the outer conductor insulated, but owing to the difficulties experienced with the end connections, this was abandoned later in the year for a twin wire. It was found that,

with the concentric cable, the very fine wires of which the outer conductor is composed were often cut by workmen in paring the insulation, and the wire was bulky. The form preferred is the paper insulated cable, in which each conductor is hemispherical in section; this cable is very small, the  $2\frac{1}{2}$  ampere branch wire being only  $\frac{1}{4}$  of an inch in diameter. This wire can be run on the surface and, owing to its flexibility, can be buried in the plaster at a subsequent date if desired. The conductors are so near to each other that it is impossible to have a fault on one wire, and certainly an arc, without both wires being connected and the fuse melting. Ordinary fittings are used and there is not the disadvantage of an extraordinary appearance, as is the case with most special systems. The ends of the cables are sealed perfectly by a special form of end connection, which is small and flexible, while moisture is kept from the paper insulation.

The fire offices and supply companies to whom the system has been submitted up to the present time have sanctioned its use, and there appears to be no reason why it should not be extensively adapted, as the cost of installation is even less than with wood casing, while there is no doubt that an extremely mechanical and safe installation is the result.

*Flexible Cord.*—The use of flexible cord for wiring fittings is not allowed in first-class work, and, in fact, the use of the ordinary flexible cord for any purpose is one of the most unmechanical and certainly the weakest portion of an installation. It is practically cotton covered wire; the rubber coating is a mere pretence and absolutely useless; the only portion of the wire which is good is the braiding. There are, however, several better classes of cord on the market, one in which all the insulation except the braiding is vulcanised rubber; this wire is not quite so flexible as the cotton covered, but it is quite flexible enough for ordinary purposes, and is very much safer than the other. A point which should be remembered is that when vulcanised insulation is used the wires should be tinned. The cost of tinning flexible cord is rather high, owing to the long length of the wire, but it should be insisted upon in the best work. In all cases where flexible cords are connected to lampholders or ceiling roses the ends should be tinned and sweated together. This prevents stray wires from touching the other pole, or, in the case of lampholders, the brass parts of the holder, so making it possible for persons to receive shocks. This latter precaution is very necessary with high-voltage fittings.

#### WINCHESTER CATHEDRAL.—II.

WE stopped last week in our recital of the history of Winchester Cathedral at what might be called the eve of the great transformation by WILLIAM OF WYKEHAM. It was shown that during a period of about two centuries and a half the building remained unaffected by changes of taste. When WILLIAM OF EDINGTON was consecrated it was still in nearly all its parts a memorial of Norman liberality and artistic power. That character should have been allowed to remain unaltered, for the principal associations of the cathedral were with Norman and other foreign prelates and kings. Winchester and its cathedral after the first half of the fourteenth century could not be reckoned among those happy spots which are without history, but from that period there was less turbulence among citizens and clergy. WILLIAM OF WYKEHAM if he had left the old nave would not have demonstrated his architectural power. He would, however, be entitled to more respect if he had shown reverence to WALKELIN's work, which was substantial enough to endure for more than a thousand years. Several of his predecessors might with as much reason consider the nave to be in an obsolete style, but they refrained from changes, and WILLIAM OF WYKEHAM should have followed their example.

It must be acknowledged that if he could not resist the temptation to innovation he at least made compensation by his manner of yielding. We wish he had shown his skill in an entirely new church on a grand scale, but what he did at Winchester saved English Gothic from an unworthy close. Whether WILLIAM OF WYKEHAM devised the peculi-

arities which belong to the Perpendicular or Rectilinear period cannot be determined. There is no doubt he was among the earliest to employ them. This will be seen from comparison of a few dates. RICKMAN was content to say Decorated English was followed until 1377, and PARKER supposes the transition from Decorated to Perpendicular to have followed for twenty-three years, and he considers the west end of Winchester to be an example. SHARPE says that the Rectilinear period began in 1360, when the Curvilinear, which originated in 1315, came to an end. It was in 1367 WILLIAM OF WYKEHAM was consecrated Bishop of Winchester, and he held the office until 1404. Whether we adopt RICKMAN'S or SHARPE'S chronology, 1377 or 1360, as the starting-point of the period, the bishop's works at Winchester must be taken as Perpendicular. If PARKER'S theory is preferred the nave is not

architect and his friend PETER are seen competing in the creation of forms which would be more remarkable for their difficulty and eccentricity than for their solid beauty. Impossibilities were attempted. Gothic architecture suffered from the same malady as philosophy and poetry—it was too subtle. The artist, continues RENAN, was so eager to excite a sentiment of astonishment and terror, he hesitated before nothing that would help in producing illusion and phantasmagoria. He concealed the supports of his building. Vaulting appeared to rest on colonnettes which were supported by lateral walls. A church became a bundle of towering reeds—"l'épanouissement d'un faisceau de roseaux." From exaggeration so aggravated English Gothic was preserved. There were signs enough that English builders were disposed to be adventurous; but if the new work in Winchester Cathedral could exercise any

WINCHESTER CATHEDRAL, FROM NORTH-WEST.

affected, for he says the change took place between 1394 and 1410. It is also agreed that WILLIAM OF WYKEHAM carried out works at Windsor and elsewhere before coming to Winchester to assist Bishop EDINGTON, so that in whatever way we consider the subject, it appears to be undoubted that he was associated with the Perpendicular style from its appearance, and so far as can be made out there was not one of his contemporaries who was better qualified to have introduced the new fashion in architecture.

Whoever was the deviser, he saved England from the vagaries which were adopted on the Continent. Before the year 1400, when "Gothique Flamboyant" is supposed to have started in France, the art was in a declining state. ERNEST RENAN considers the Album of VILLARD DE HONNECOURT as sufficient evidence of what "l'ivresse de combinaisons" was destined to produce. On one page the

influence, it was that of a corrective to the tendency towards license which was to be found in some churches of the period. According to Mr. RUSKIN, Perpendicular work is "detestable," yet as there must be degrees in badness he would probably admit that, in spite of their rigidity, the English examples are preferable to the riot which is easily found abroad.

Whatever may be thought of detail by critics who adopt a similar standard with Mr. RUSKIN, it cannot be denied that WILLIAM OF WYKEHAM exercised remarkable tact in dealing with the nave. Whether he planned the alterations which Bishop EDINGTON commenced is not certain, but we cannot believe that he superintended the operations. Apparently there was then a removal of the Norman work before the new masonry was laid. WILLIAM OF WYKEHAM seems to have used as much as he was able of the piers,

and may have altered not more than one bay at a time. He realised the value of height, but restricted himself by adopting the floor and string-course of the clerestory as constants which were to be respected. To gain effect it was necessary to sacrifice the triforium or to diminish its importance to a minimum, but the practice was so general during the Perpendicular period, it is not impossible there were other causes to account for the indifference to that ancient gallery. In that way he was able to obtain bays in the nave which were at least one-half higher than those of WALKELIN, and a clerestory that was of far greater importance. Besides, there was a vaulted ceiling which looks as if indispensable, and explains the necessity for the height of the piers. The late J. D. SEDDING gave much attention to WILLIAM OF WYKEHAM'S great effort, as the following remarks will show:

In architecture man's imagination employs two mediums by which to express itself—first, by the disposition of lines, mouldings and masses in agreeable proportions; and secondly, by sculpture. The relative importance of these mediums of imagination it has been the great life-work of Mr. Ruskin to enforce, and I shall have presently to test the sculpture of the Perpendicular period by the canons of criticism which he has so eloquently and truly propounded. But first as to the science of proportional lines in elevation. Winchester Cathedral affords a well-known illustration of the process of transformation which went on as the science developed. I have had Willis's drawing of the nave in its original state and in its present state enlarged, and it will be both interesting and instructive to compare the aims of the workmen in the early and later middle ages. The Norman compartment is divided into three parts of nearly equal altitude, whereas the Perpendicular is divided into two parts enclosed under one arch. The lower pier-arch of the Norman work is less than one-third of the whole height, whereas the pier-arch of the Perpendicular work is half the total height. The triforium is of equal importance to the other two parts in the Norman arcade, but in Wykeham's work it is subordinate to the general design, and becomes a panelled balcony.

I am well aware that they who look at early art with rose-coloured spectacles consider that the omission of the triforium as a leading feature in a Gothic edifice is one of the many signs of debasement ascribable to the Perpendicular period; and I am also aware that these same people with charming inconsistency declare in the same breath that the proportions of Wykeham's nave, which they even cannot but admire, are the proportions of the Norman nave. But the student finds sufficient reason for the changes that took place by simply following the course of art development. In the first place a design that shall please a trained eye must be governed by laws of proportion, and it needs no angel from heaven to tell one that the proportions of the Norman arcade are not of the highest order. Here is a given height to be dealt with, which the designer wishes to divide into three parts, and in untaught fashion he makes the three parts of equal height, and there is nothing principal and nothing subordinate, nothing above and nothing below the rest. This, then, is not a composition, if composition need the conscious disposal of parts.

Another point to be noted with regard to this and kindred work is, that a design is made bit by bit, and one part is not intimately linked to the other part. A compartment of a nave arcade stands alone; it may be repeated, but one bay does not lead the eye into the other. In this Norman nave the abacus moulding of the pier-arch and of the triforium stops short at the nave pier; there is no through string-course under the triforium to connect bay with bay; while the clerestory runs on to a tune of its own, regardless of any required harmony in the lower parts, and even the centres of the clerestory arcade do not agree with the two lower arcades. A glance at the Perpendicular nave shows a transformation so complete that one might call it antipodal. In every particular where similarity was possible, the Perpendicular is designed in entire disregard of the earlier fabric. It is true that some of the early piers are reworked as they stood, but in regard to the proportions and aims of the later work the architect acts as independently as though the whole had been rebuilt from the ground. The nave of Canterbury is like it, and that was rebuilt from the ground and begun in 1380, before Wykeham's nave. Again, the designs of other cathedrals of intermediate date exhibit a tendency towards the very treatment here brought to such perfection, and the nearer the Perpendicular period the stronger the tendency. To take two such instances in the choir of St. Albans and the nave of Exeter Cathedral; and although the triforium is so strongly marked in such examples as Salisbury and Lincoln, yet in both of the cases I have named the triforium practically disappears. It is clear, therefore, that the Perpendicular nave of Winchester is a spontaneous expression of the principles and laws of design as then understood.

To carry this matter further. In regard to composition, the composition of Salisbury is higher than that of the Norman

nave of Winchester, just as the Perpendicular of Winchester is higher than the Early English at Salisbury; and Exeter lies between these two both in ability of design and the clearer association of part with part. Salisbury gives us, through string-courses which we do not get in the Norman nave of Winchester. But neither Salisbury nor St. Albans carry out Gothic principles to perfection. At St. Albans, as Mr. Freeman has pointed out, the three continuous horizontal ranges have no more vertical division into bays than a primitive basilica. And though vertical lines are more enforced at Exeter, so as to mark the bays more definitely, yet they are only used for a moiety of the whole height, whereas at Perpendicular Winchester there is a continuous line from ground to vault. The evolution of the inherent principles of Gothic design is also to be illustrated in another particular. Exeter nave dates from 1331, Winchester nave, 1394. At Exeter a large traceried window almost swallows up the whole space above the pier-arch, but the triforium forms no part of a scheme in the general design. There is nothing to carry the eye from pier-arch to triforium arcade, nor from panelling to window. The window has five openings, the triforium four. The design is checked, it is not a whole. But at Winchester the vertical principle is strongly felt and asserted, and the law of association has ultimately linked part with part. The clerestory and triforium are unlike the earlier clerestories and triforiums. The old division was but threefold, this is multifold. The window here only forms part of a composition of wall-panelling which has a deeply-moulded arch divided at mid-height by a transom. The harmony is intricate. The tracery is first divided into three divisions, then into five—the middle taking three, and the side compartments one panel each. The window is not a feature by itself; it is less a window than a glazed space in tracery which would take its present shape whether glazed or not. And even the upright bars separating the sides from the centre compartment are carried through in the spandrel of the pier-arch, and the cusping is repeated, as though the designer would have no internal rivalry anywhere, but all should be ruled by one purpose. Nor is this all. So strongly is the artist dominated by the sense of harmony, so exalted is his perception of the beauty of order, that the whole structure becomes one grand piece of harmonious toil. Not only is the division multifold, as I have said, but each part has its multifold division, in principal and subordinate members; the eye never rests on a fragment, but is led to see the whole. The structure is one system of energetic, copious life, the vertical moulding of the wall-pier rises like a tree from the ground, to burst into branch and flower in the lierne vaults overhead. On every possible count, then, the Perpendicular nave at Winchester differs from the Norman, and hence the significance of the example.

How so many amateurs in Mediæval times contrived to design buildings is incomprehensible, especially if we judge them by a nineteenth-century standard. The mystery is not so obscure in the case of WILLIAM OF WYKEHAM. He was so long connected with building works, the wonder is how he attained the knowledge which was desirable for a bishop. WILLIAM was a brave man, and CARLYLE was justified in his admiration of him. The next bishop was HENRY BEAUFORT, who is generally considered to have been the chief cause of the evils which befel England in the reign of HENRY II. But the Cardinal was not so black as SHAKESPEARE represented him, and if he did not make many changes in the cathedral, he was munificent to the Hospital of Holy Cross. WAYNEFLETE, who followed, was a quiet man, whose thoughts were occupied with Magdalen College, Oxford, of which he was founder. COURTENAY erected at least a bay in the cathedral, but LANGTON was less ambitious. To RICHARD FOX, who was rewarded by HENRY VII. with the bishopric, Winchester was indebted for the great screen, which J. D. SEDDING considered was unrivalled for its canopies, for he maintained there is more imaginative power in the central canopy than in a score of modern churches—it is a miniature cathedral. Fox was the last of the prelates who might be called building bishops, and he was a fitting follower of WALKELIN and WILLIAM OF WYKEHAM.

---

**The Executive Committee** for the erection of a memorial of Archbishop Benson have recommended that a sum not exceeding 2,500*l.* be set apart for the monument in Canterbury Cathedral, and that the balance of the sum collected be devoted to some definite portion of Truro Cathedral, the details of this being left to the Truro committee. The designing of the monument in Canterbury Cathedral and the superintendence of its execution is placed in the hands of Mr. T. G. Jackson, R.A., the execution of the effigy being entrusted to Mr. Thomas Brock, R.A.

## NOTES AND COMMENTS.

WE lately offered some remarks about the new method of dispensing with a contractor which has found favour with philanthropists in several countries of Europe, and showed that wherever tried it was followed by failure. The last report of the Department of Public Works in New South Wales affords another example. The engineer for roads, in describing the relief works which were undertaken in the neighbourhood of Sydney, says:—"In carrying out these relief works, the co-operative or butty-gang system was adopted, and had a fair trial. The whole of the work done was let to small gangs at prices based on departmental estimates, and although 380 men were employed in small gangs, averaging from ten to twenty-five men, the whole experiment, as far as the men were concerned, was a failure. The system in theory is very good, and, under a capable leader, hard-working and competent men should not only make wages, but have in addition what would otherwise be the contractor's profit. Experience has shown, however, that in most cases in choosing their ganger the men have made an unwise selection, and his authority has been practically nil. Further, that in almost every gang there have been so many loafers that the average earnings of the workers have been reduced by 20 per cent. This system has been tried in other parts of the colony with similar results." It would be fortunate if the unwise selection of leaders was confined to New South Wales, but the same cause operates still more in England. But if working-men will confide their interests to incompetent hands, what is to be expected? A man may pose as an oracle and remain a windbag, but a mischievous one.

It was announced a few days ago with befitting ceremonial that the President of the Royal Society of Painters in Water-Colours would be allowed to wear an official chain and badge at any Court ceremonies he attended. Immediately afterwards the President of the Society of Painter-Etchers states that a similar privilege awaits himself. In one case the badge has been designed by the versatile Mr. HERKOMER, R.A.; the Painter-Etchers appear to consider the work as too important to be entrusted to an individual. According to the mystic Professor TEUFELSDRÖCH, "All visible things are emblems; what thou seest is not there on its own account; strictly taken, is not there at all. Matter exists only spiritually and to represent some idea and body it birth." What idea does the new badge stand for? It might be supposed something of the kind was needed as a sort of label to distinguish so venerable and worthy an artist as Sir JOHN GILBERT amidst a crowd of beribboned and bespangled old gentlemen. But the badge is in reality taken to be a sign of victory over the Royal Academy. The Academicians offered no respect to water-colour drawings, and now water-colour artists have their Royal society, and their president is on a footing with the successor of Sir JOSHUA REYNOLDS, and can display no less brilliant a badge on his bosom. The Academy received engravers, but the doors are closed to etchers. The etchers now in turn constitute a Royal society, and will shortly possess insignia for their president. The office of President of the Royal Academy is therefore hardly worth acceptance, for the holder of it is no longer a unique personage in one of the crowds at Court. He is only one badge-bearer among several. Happily neither painting nor etching will gain or lose by the struggle for a badge, for the temporary possession of one does not make a man handle a pencil or a needle with more dexterity.

THE French Académie des Beaux-Arts is compelled against its inclination to recognise that art follows a course which is not determined by the rules and regulations which were formulated by the early members. Occasionally, however, an opportunity is offered for the Académie to reassume its ancient character without incurring any responsibility. The selection of subjects for prize essays is generally utilised for that subject. For example, it is arranged that the Prix Bordin will be given in 1899 to the author who produces the best essay (in an academical sense) on the following subject:—"The conditions, from the point of view of art

and of special qualities, which distinguish engravings from the results obtained by various heliographic processes, as well as the characteristics of the different schools of engraving when opposed to the fatal uniformity of mechanical productions." The Académie does not attempt to be impartial, and supposes that essayists are no less indifferent. The line which is to be followed by all who aspire to gain a prize is clearly defined. Anyone who is not disposed to believe, for a time at least, in the worthlessness of all photographic reproductions in comparison with any sort of an engraving has no chance in the competition. If it were said that long before heliogravure was employed Mr. RUSKIN expressed there were only two engravings in the world which could be considered as worthy of the pictures they represented the Académie des Beaux-Arts would be unmoved. How many French painters have approved of engravings from their works? The success of lithography in France is mainly owing to the dissatisfaction of artists, who have felt that the roughest drawing on stone, so long as it suggested the "values" of the original, was preferable to the most laboured engraving. The English mezzotints of the last century were another indication of revolt against engraving in the ordinary sense of the word. There is no more mechanical reproduction than some of the prints which once were popular. If they have ceased to be admired in France one of the reasons is that painters preferred photographic reproductions. We doubt if any of the members of the Académie des Beaux-Arts, with the exception of the few engravers, are very partial to the ancient art, but in their corporate capacity they are obliged to sacrifice their principles as individuals.

THE Duc d'AUMALE is busily occupied with the preparation of the catalogue of the contents of his palace at Chantilly. Buildings and works of art are to become the property of the Institut de France, and the prince is desirous that doubts shall not arise hereafter about the authenticity or the history of any object with which he has enriched his country. While the Duc d'AUMALE will write a general history of the château and its treasures, he has obtained the co-operation of specialists for the detailed descriptions of the different sections. M. GEORGES DUPLESSIS, a member of the Académie des Beaux-Arts, has undertaken the catalogue of the engravings. M. BOUCHOT, of the Bibliothèque Nationale, will write about the pencil portraits dating from the sixteenth century. The archaeological examples will be described by M. LÉON HEUZY; the libraries are to be entrusted to M. GEORGES PICOT, and the manuscripts to M. DELISLE. Sculpture, furniture, bijoutry, &c., will exercise M. GERMAIN BAPST's great learning, and M. GRUYER will deal with the paintings. The catalogue will consequently become a work of authority which can be consulted by experts.

THE French scaffold builders are proud of their constructions, and therefore are more opposed to their demolition than men who employ stone or brick in building. Sanguine people imagined when they found the forest of timber around the Arc de Triomphe was removed, in order to allow the Czar to have a glance at CHALGRIN's work, that they would be able to enjoy once more the fine prospect in which the arch was an element. But they were doomed to be disappointed. The scaffold builders, with the approval of the authorities, have selected the time when crowds of Parisians once more have to pass by the Arc de Triomphe for another display of their handiwork. It is to be hoped they will condescend to remove the timbers before the international exhibition of 1900 is closed, so that some strangers at least may have an opportunity to see the most remarkable example of a triumphal arch which the world possesses. If the *Départ des Volontaires* by RUDE can be preserved, the Parisians would not object to a temporary concealment of the masterpiece; but it is remarkable that while figures which express the revolutionary spirit more emphatically than any history should be decaying, the lifeless *Résistance* of ETEX should be invulnerable to all that time and weather can do.

## THE ENTHRONEMENT OF CHARLEMAGNE.

**A**MONG the paintings in the Panthéon of Paris is a very big one in three compartments, by M. HENRI LÉVY, representing the *Coronation of Charlemagne*. Our readers will remember the large illustration of it which we have published. An additional bay had afterwards to be filled, and in it M. LÉVY has painted the work we now reproduce. It is in keeping with its larger companion, and presents the courageous composition and brilliancy of colour which entitle the artist to be considered as a worthy follower of RUBENS.

A print of CHARLEMAGNE is not so much out of place when in company with a view of Winchester or the cathedral as it might appear to anyone who had not considered the subject. EGBERT, who was the first great king of Wessex, of which Winchester was capital, spent at least three years under CHARLEMAGNE. The Emperor's Court was a refuge for ambitious refugees. When BRIHTRIC was elected to the throne of Wessex his rival was EGBERT, who, on failing to secure the majority of votes, fled for safety to Aachen. There he was initiated into the arts of war and government. On the death of BRIHTRIC the claim of EGBERT was recognised by the West Saxon thanes. During nineteen years he gradually extended the power of Wessex until his rule was accepted over the greater part of England. The Saxon Chronicle describes him as "the eighth Bretwalda," or sovereign of Britain, his predecessors being ÆLLA, CEAWLIN, ETHELBERT, REDWALD, EDWIN, OSWALD and OSWIG, most of them resembling shadowy beings rather than brave men who endeavoured to bring order in our British chaos. EGBERT had to contend not only with rebellious vassals, but with the terrible seakings, the sight of whom compelled CHARLEMAGNE to weep. In 833 a fleet of thirty-five of their vessels appeared at the mouth of the Dart, and the West Saxons fled. EGBERT then organised a system of defence, and when the invaders next appeared he met them at Hengstone Hill and was successful. He returned in triumph to Winchester, which he had preserved from the northern rovers; there he died, and it is believed his dust is to be found in one of those mysterious coffin-chests which are placed on the choir-screen of the cathedral.

It would be ridiculous to attempt within the limits imposed upon us an estimate of the character of EGBERT's master, the great emperor who is claimed by Frenchmen and Germans as their special ruler and compatriot. Few men can have so good a claim as CHARLEMAGNE to be numbered among those monarchs who still rule, as it were, from their tombs. Europe continues to be under his power. He was forced to be severe. In one day, for example, no less than 4,500 Saxons were decapitated at Verden by his order, but withal he was held in so much veneration, it was found necessary to remove his remains from the tomb in Aachen in order to prevent an undue reverence to them by people who considered him to be a demi-god. There is, however, one trait in his character which has been too much overlooked even by writers who have devoted large tomes to CHARLEMAGNE. We mean his recognition of architecture as an agent in civilisation. We can have evidence of that characteristic in the simple pages which were composed by his son-in-law, EINHARDUS or EGINHARD, an ecclesiastical dignitary whose revenues appear to have been always applied to good uses.

According to EGINHARD, the emperor, although constantly occupied with the carrying out of his vast designs for the extension of his empire, "undertook numerous works in various places for ornament and utility and was enabled to complete several of them. Among them were the basilica of Aachen, and a bridge 500 paces in length across the Rhine. A fire consumed his bridge in the year before CHARLEMAGNE's death. There was no time to repair the disaster, but the thought of a new bridge was constantly in the emperor's mind, and he was desirous to employ stone instead of timber in its construction. CHARLEMAGNE also began two remarkable palaces. One was not far from Mayence, and near the domain of Ingelheim; the other was at Nimeguen. But the erection of churches throughout the whole extent of his kingdom was above all things the object of his care. As

soon as he heard churches had fallen out of repair he gave orders to the prelates and religious communities to restore them, and he appointed commissioners to insure that the work was done." In another place EGINHARD relates how the emperor adorned the basilica at Aachen with gold and silver candelabras, screens and doors of massive bronze, and how he had columns and other works in marble brought from Ravenna and Rome. He presented a large number of vases in gold and silver to the church, and most sumptuous vestments. It is mentioned by EGINHARD that the "porters," who formed the humblest grade of the ecclesiastical order, were not overlooked, and were so well provided with special habits, they never had to wear ordinary dress at any of the functions. He was eager to see Rome reassuming its ancient preponderance among the cities of the world, and although he was unable to visit St. Peter's on more than four occasions during forty-seven years, he endeavoured by his gifts to make the basilica supreme in ornaments and riches.

In his will he announced that all the gold and silver, precious stones and regal ornaments in the treasury had been divided by him into three great portions. The first and second were subdivided into twenty-one parts, corresponding to the number of archbishoprics in his kingdom. One of the parts was to be handed over to each archbishop, who was to apply a third of the value for the use of his own church and to distribute the remainder among his suffragans. In order to avoid confusion, each part was placed by the emperor in a coffer duly labelled. The third part comprised not only an equal amount of gold and silver, but a large number of vessels, arms, vestments, tapestries, woollen stuffs, and whatever else was to be found at his death in his own robing-rooms and chambers. If in the chapel there were any treasures which were not specially devoted by CHARLEMAGNE to its use, or which were not inherited, they were also to be sold, in order to increase the amount to be given in alms. The large quantity of manuscripts were to be also sold and the proceeds bestowed on the poor. In the arrangements we can see that CHARLEMAGNE, although he might leave kingdoms to his heirs, believed it was right to comply with the doctrine of sacrifice and distribution of goods. There is particular mention of three silver tables in the will. One, on which appeared a view of Constantinople, was to be presented to the basilica of St. Peter in Rome; a round table with a view of Rome was destined for the cathedral of Ravenna; the third, which was heavier and more beautiful than the others, and was remarkable for the art with which the universe was shown on it, was to be sold for the benefit of the poor, and the emperor's golden table was destined to the same purpose.

From his will we see that CHARLEMAGNE was a collector, and he may have had the excusable selfishness of his class and could not think with satisfaction of other princes enjoying his treasures. That may have been one of the reasons for his generosity. In his time collecting was not a financial speculation as it is nowadays. Being a collector, we may conclude he was an amateur, and from the style of the will with its description of various objects that conclusion is confirmed. Was he an artist? That may be answered by another question, Was he a poet? There are noble hymns, such as the "Veni Creator," still in use which are attributed to him; and as men were versatile in those old days it is not impossible that CHARLEMAGNE could design. At least he was a better judge of fitness than some architects of the time, for it is said he found great difficulty in preventing columns from being fixed in a reversed way, with their capitals below and the bases above.

EGINHARD we know was an enthusiast for architecture, and probably the art was one of the links between the emperor and the religious. One of his letters to his son VUSSIN suggests that around CHARLEMAGNE there was a love of art which helped to redeem the general character of the Dark Ages. EGINHARD writes:—"I have sent you a list of some words and obscure phrases which are found in VITRUVIUS; in fact, as many as I was able to gather up to the present. I hope you will endeavour to seek out the meaning of these for me. I imagine that you will obtain some help in the solution of them from the casket which was made by the artist E., for it has ivory columns which are imitated from antique examples. As to what

VITRUVIUS calls "scenographio," it would be well to consider VIRGIL's lines in the third book of the Georgics:—

Jam nunc sollemnes ducere pompas  
Ad delubra juvat cæcosque videre juvencos,  
Vel scæna ut versis discedat frontibus, utque  
Purpurea intexti tollant aulaea Britanni."

It is remarkable to find the grandson of CHARLEMAGNE occupied with an exposition of VITRUVIUS, that venerable authority who is likely to remain a puzzle to all generations of men—it may be because he was not possessed of a practical acquaintance with the subjects he dared to treat. EGINHARD could be made to furnish many other fragments of news of a technical kind, as well as some relating to different subjects in the ninth century. But we have already said enough to justify admiration for CHARLEMAGNE by an English architect.

WINCHESTER CATHEDRAL.—SOUTH AISLE, LOOKING WEST.

SHAKESPEARE THEATRE, LAVENDER HILL, S.W.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary general meeting of the Institute of Architects was held on Monday evening last, the president, Professor Aitchison, A.R.A., in the chair.

The minutes of the last meeting were read and confirmed.

Mynheer P. J. H. Cuypers, of Amsterdam, was elected the Royal Gold Medallist for the current year.

Mr. Owen Fleming moved and Mr. Hooper seconded, "That it be referred to the science standing committee to consider the desirability of formulating a definite standard size for bricks."

Regarding the question by Mr. Robert Williams as to whether "the Institute of Builders have agreed to abide by the provisions of the form of contract sanctioned by the Institute," Mr. William Woodward said first-class builders had refused to sign the conditions, and it seemed to him the observations he had made before on the same question were accurate, and that the best thing for the Council to do would be to withdraw the conditions from circulation, which would not impose much of a loss on the Institute.

The President said the Institute could not well take any action in the matter.

Mr. John Slater read Professor Eidlitz's paper on

### The Educational Training of Architects.

During the last half of the present century the questions "How are Architects to be Educated?" and "Are we ever to have a New Style?" have been prolific sources of discussion. The answers to the first of these questions vary between the two extremes—"Architects shall not be educated at all," and "They shall be taught to know everything"; and to the second, that "We will probably never have a new style, but that such a thing may happen in the course of time"—a long time. These discussions are carried on with mutual forbearance and good feeling, but without any other result than an expression of opinion by the majority of the disputants that students of architecture shall learn something of the technique of building, if this can be done without the suppression of inherent genius. Genius in this case means a lively poetic imagination, capable of remembering, selecting and combining existing forms into a whole which shall be picturesque. It has been observed by practical architects that an extended mathematical and scientific training breeds able constructors (engineers), but is detrimental to the artistic perceptions of the students. Existing forms may be repeated or combined by human imagination, but new forms can result only from new functions logically developed. Up to the thirteenth century architects were builders who arrived at progressive methods of construction mainly by practical experiment, the laboured results of which were stored up as rules-of-thumb by guilds and individuals, and modelling and decoration were mainly matters of feeling, but of the feeling of men who thoroughly knew their methods of construction. The guilds and their rules are past and gone, but during the last century the science of mechanics has been developed. This science enables us to compute with precision the strains caused in all combinations of matter which have served, or may hereafter serve, to form structural elements. To illustrate briefly, We know, a certain distribution of weights being given, which is to be sustained between two points of support, what is the line of pressure caused by these weights, hence what the form of the arch to sustain them with the least amount of material. Or the form of an arch being given, what is the ideal distribution of loads which corresponds accurately to its resistance? Or, again, the form of an arch

being given, which we know not to correspond with the distribution of its loads, what will be the magnitude of the strains produced in any part of it, and how are these strains to be resisted? We know exactly what is the lateral pressure of a given arch, and what is the stability of an abutment needed to resist it. We can compute the transverse strength of a beam or a lintel, the bending moment of a pillar, or the deflection of either, under loads so small that it cannot be measured. Now, we are all ready to admit that this knowledge is useful, and perhaps necessary to the student of architecture, to enable him to construct buildings that shall be stable and enduring; but many of us doubt that it has anything to do with architecture as a fine art, which means with the composition of architectural monuments which shall be beautiful to look at and expressive of their purpose and meaning. I presume that all architects agree that form, modelling and decoration constitute the elements of beauty and expression, and that of these *form* is the most important. If we imagine every piece of sculpture carved decoration and moulding removed, say, from the cathedral at Amiens, so that nothing remains but the bulk of piers, arches, vaults and buttresses, the ruin will still express a Christian monument of great beauty. Now, the ecclesiastical expression is owing to what in music would be called the *motif*, which is Christian in character, lofty in its conception as a House of God and in the grouping of its parts, which designate worship in the chevet, the presence of officiating priests in the transepts, the people in the nave, the aisles with their processions, chapels and confessionals; while harmony is certainly due to a just and accurate treatment of structural parts and their mechanical value, which is determined by local strains. In music neglect of a strict mathematical relation of sounds results in discord. So in architecture harmony of form can be obtained only by a strict observance of the mathematical relation of strains. Harmony of strain means that stress should be always resisted by a proportionate amount of material—no more, no less. This does not mean that there should be no more material used than is absolutely necessary to perform a given amount of mechanical work, such, for instance, as we consider proper in economic structures, factories, warehouses, tenements, &c.; but whatever the amount of material to be used in a given architectural monument which, in the opinion of the architect, is commensurate to its character of stability, dignity and elegance shall be proportionate to actual strains throughout the whole design. To be explicit, each building material sustains a certain amount of strain at the breaking point. The actual strain permitted in any structure in practice is but a fraction of the ultimate strain of the material at the breaking point. This fraction is known as the factor of safety, and should, for the same material, vary in different buildings, in accordance with their dignity. The architect may use one factor of safety for a school-house, another for a library and yet another for a church. The factor of safety so chosen becomes the keynote of his design, and a constant reference to it insures harmony. Factors of safety vary with the different materials, and more or less depend on limits of elasticity, methods of construction, probable effects of the weather, corrosion, &c. Strain is the sum of weight, its direction and resulting bending moments. It appears from the above that the greater the ultimate resistance of the material, the greater is the admissible maximum strain, hence the more elegant the structural forms. It occurs that in the use of modern rolled iron form becomes attenuated far beyond the limits of the forms the architect is familiar with. It may be asked here, and doubtless many a respectable member of our profession would ask, What the author could have done with an ugly iron or steel pillar rivetted up of rolled material? Without discussing that question at this time—although it may be asserted with confidence that a post of that description is not at all outside the pale of æsthetic possibilities—it may be suggested that a cast bronze column was perfectly practicable, and so was a granite column of sufficient diameter to carry the load. What the architect had in mind, however, was not the question of mechanical work to be done, nor the question of relative strains, and an harmonious architectural development of forms, but the beauties of the Greek portico, which must be preserved in spite of new conditions and the invention of new material. Of course, no new style of architecture can be expected when new conditions, such as a twenty-five storey office building—or the invention of a new material, such as rolled steel—are referred to the Greek portico instead of the law of gravitation.

A great stumbling-block to the student of architecture is the constant and exclusive reading of its history, which is tacitly presented by schools, and avowedly accepted by students to be a system of building which serves all the purposes of a philosophy—or a science and art—competent to teach building scientifically and artistically under conditions which never occurred in the history of the past. The mathematical training in modern schools and universities is usually sufficient to enable the student to devise methods of construction, and when devised, to compute with accurate resulting strains. Students who then enter an architectural course are turned over to

special teacher of architecture, who tells them to design buildings of any kind—from a storehouse to a cathedral—not in accordance with their acquired knowledge of mechanics, but in accordance with methods pursued by the Greeks, the Romans, &c., who were not at all familiar with the science of building as now understood, but who constructed merely in accordance with their practical experience. For further information the student is referred to "Art History." Now the Greeks, the Romans and the master-builders of the Middle Ages, though not scientific in the modern sense, understood form, because they practically knew the mechanical function of structural elements, and had a realising practical sense of the relation of masses, hence also of the form, modelling and decoration of these masses. The modern student of architecture has no experience in building, and when he enters the academic course discards from his mind his previous scientific attainment, which never existed in the shape of forms, but merely in an aggregation of mathematical reasonings. He is not taught how to refer to that reasoning in developing forms, but instead is asked to study forms in the abstract as presented in history. The system of the *Ecole des Beaux-Arts*, which is imitated in many schools outside of France, is utterly subversive of possible logical architecture. Students are required to prepare sketches, often of important architectural monuments, in from six to sixteen hours. By rules of the school, these sketches may be measurably foggy, as long as the finally completed drawings can be construed to be somehow indicated in the original sketch; this means that the process is a matter of composition of form and not a rational development. Criticism of these designs by teachers admits transgression against good construction as comparatively pardonable, but insists on observance of traditional treatment of form as imperative. The study of architectural history (more especially if perused critically) is doubtless beneficial to the architect, but should be postponed for a post-graduate course, or should be left for private reading after the academic course is completed. A future text-book of architecture for universities, polytechnic schools and academies of the art of architecture, will doubtless bear the title "The Theory, Practice and Art of Building." What is meant by architectural scales may be best illustrated by one or more examples, for instance:—Given a pillar of a certain length and the load it supports in pounds, what will be its sectional area and what its form, modelling, carved ornament and colour decoration (if any) in a warehouse, a public school, a library, a court-house, and a parish church, when the pillar is made of wood, cast-iron, wrought-iron, bronze, brick, sandstone, marble or granite? The text-book would answer these questions and illustrate the answers by drawings and diagrams. It would state how variations of treatment would accrue by reason of difference in the length of the pillar, also how pillars of similar nature have been treated in notable monuments of the past, and discuss the merit of such treatment and point out its material defects. Wall piers considered as pillars would be treated in the same way. Then would follow the consideration of braces, capitals and corbels. Further, that of lintels, arches, groins and cupolas, and the resulting lateral pressures and abutments, and also of roofs, stairs and incidental structural elements. Assuming the architectural scales to comprise the first part of the text-book, the second part will treat of the construction of single cells and the combination of these into piles. The students would attend lectures on the *rationale* of structural elements and composition, but would devote most of their time to drawing structural parts and finally entire buildings and monuments, not by copying from the text-book, but by an individual treatment of the subjects contained therein under the guidance of a professor and his assistant or assistants. The latter would see to it that adherence to strain is strictly pursued. By this process, students would in their work be corrected and helped daily, and would progressively acquire a habit of referring design to building and its mechanical import. That monuments thus conceived and designed will be expressive of their meaning and the individuality of their author cannot be doubted; nor that they will be harmonious in themselves and will vary from the forms of the past in the degree as new wants, new material, new methods of construction vary and excel those handed down to us in history. When a natural organism decays and dies it still exists in its elements, though not in its original form. These elements under different environments combine again into new organic forms of different function. Science and art obey a similar law. Principles established by experience continue to live as accepted truths, when the forms of artificial organisms which they originally developed have ceased to be fitting or useful to human needs, more especially when those principles first crudely announced have become accurately determined by quantitative analysis. The cross-bow and modern rifle, the spinning-wheel and the present spinning-machines, and ancient galley and the armoured steamer, all serve as practical illustrations of the above. Architecture alone, of all human pursuits, retains obsolete forms, and neglects underlying principles and organic laws. It must be re-

membered, however, that this was not the case prior to the fourteenth century. Five hundred years of decrepitude leads thinking minds to question a possible resuscitation, and when now and then such a possibility is seriously contemplated we talk of centuries and generations because past progress has consumed such periods of time. But when we consider the great strides of the present century owing to the knowledge and application of positive scientific methods—the metamorphosis of Japan, for instance, within the last generation purely by the acknowledgment and practical acceptance of these methods—we must come to the conclusion that a period of one generation is quite sufficient to initiate renewed rapid progress in architectural art, always provided that we are willing and helpful to refer it to its true and fundamental principles, and to teach it rationally.

Mr. H. H. Statham, who proposed a vote of thanks to Professor Eidlitz, considered some of the suggestions in the paper valuable, but he thought they would share the fate of many other clever theories on the same subject. If architectural students could be isolated on some desert island the new style might be evolved, but as long as people had any knowledge of old forms, and books containing and explaining examples were within their reach, the human mind must partly imitate the old. The teaching of the *Ecole des Beaux-Arts* was the best training for architects, and Mr. Hamerton was right when he said "there were more living architects in France than any other country in the world."

The vote of thanks was seconded by Mr. Emerson, hon. sec., who read the following remarks by Mr. Arthur Cates:

The educational training of architects, with which the Institute is concerned, is clearly not one in which "they shall be taught to know everything," nor is it one the aim and object of which is to produce the evolution of "a new style," whatever that once much-used phrase may mean. The educational training which is now organised aims at fitting the student for the acquisition of the knowledge necessary for the satisfactory practice of his profession in developing his natural artistic and scientific ability, so that he may apply both to the expression of his ideas in design and in the realisation of his conceptions. In the complex conditions of the practice of the day the architect must aim at acquiring the power to attain success in designing buildings which shall be of convenient and appropriate in arrangement, shall be of stable construction, and shall be of suitable and beautiful design, both as regards masses, form and detail. The first studies of the aspirant should be devoted to a mastery of Classic and Mediaeval work—intelligently studied, with a thorough acquaintance with form and detail—leaving the Renaissance and later developments to a subsequent period, when he can bring to bear on their consideration the knowledge acquired in the first years of his studies. In both periods the sedulous cultivation of the art of accurate and effective delineation, and of sketching detail and ornament from buildings and from memory, thus bringing eye and hand and brain into harmonious and mutual action, is of the highest importance. Concurrently with this, the study of the history of the several periods of architectural art is of the greatest value, not as a mere matter of dates and names, but as giving life and interest to the subjects studied, connecting them with the actual social life of the people by whom they were evolved, and with the political, social and religious influences which controlled their design. These historical studies train the mental and artistic powers, and by giving a keener appreciation of the excellence of excellent things, and of the causes of such excellence, refine the taste and strengthen the judgment. It has been well said by Professor William R. Ware—"I cannot help thinking that this discipline is calculated to calm the anxiety of those who fear that too prolonged courses of academic study may enervate the powers instead of stimulating them, and, as in a hot-bed, bury or burn out all seeds of originality through too rich a culture. I fancy that these fears have in general but little foundation, and that it is not through over-education that talents are lost to the world and fail to bring increase to their owners, so much as through their lying neglected, or, as sometimes happens, being too carefully tended by their possessor lest their original brightness should be tarnished. Still it is true that in the conduct of life, and especially in the practice of the arts, which is but the finer kind of living, it is the special personal quality, the spark of individuality and originality which lights every man who comes into the world, that has intrinsic value, and though the risk of extinguishing the flame is too strong, and a draught may be exaggerated, it is not possible to exaggerate the importance of fostering and magnifying it. There is no knowing what fire it may not kindle. If ever you have a new idea, however slight and unimportant it may seem to be, cling to it, cherish it, develop it, and some day you may awaken and find yourself immortal." This immortality, if to be one of honour, is not likely to be attained by the study of the suggested "future text-book of architecture for universities, polytechnic schools and academies of the art of architecture, which will doubt-

less bear the title 'The Theory, Practice and Art of Building.' It is not easy to comprehend what would be the exact nature of this text-book, which would profess to give the "form, modelling, carved ornament, and colour decoration (if any) for pillars, and probably other details in a warehouse, a public school, a library, a court house, and a parish church." And out of this text book are to be evolved monuments that are to be expressive of their meaning and of the individuality of their author. The Institute has an excellent opportunity to afford encouragement to the study of the means of satisfying new wants, by the use of new materials and new methods of construction, and the more extended application of those materials with the existence of which we are familiar, but of whose capabilities in, perhaps, unexpected directions we have no appreciation. The Soane Medallion and its accompanying travelling studentship is in the free and uncontrolled disposition of the Institute. At present the only qualification of competitors is that they shall be "British subjects under the age of thirty years," with the result that each year shows a great amount of misdirected and wasted energy on the part of untrained competitors who have entered on design before they have mastered the essential principles which should govern it. By altering the conditions to secure that these principles should have been mastered, and even by securing that the competitors should have had some reasonable training, by making associateship or qualification there for an express condition, the results would certainly be more satisfactory, the cause of the educational training of architects be greatly advanced, while some new developments of design arising out of the application of new materials might possibly arise. The questions raised by the "Text-book" suggestion were considered a short time ago from a different standpoint by the committee of education of the American Institute of Architects, and Professor W. R. Ware, in the paper above quoted, says in relation thereto:—"The committee on education expressed the hope that if the study of the historic styles were systematised and co-ordinated in the schools, such an effective concentration of intelligent effort might aid in developing a system of architectural form that should be nationally characteristic, and should be more accurately adjusted to the expression of modern American life than those now in vogue. We do not feel that it very much concerns us to exert ourselves to any such end; we do not see that we have any cause to map out the future, to cast a horoscope, or to attempt to influence events towards issues indicated by any astrology that can be devised. We distrust the science which, in our present state of ignorance, undertakes to foretell or to control the architectural weather. All we can be sure of is that the architecture of the future will be good or bad, noble or ignoble, fair or foul, according to the personal character and professional prowess of the men who have it in hand. All we can undertake to do is, if possible, to inspire the young men who come under our hand with a certain measure of good sense and good taste, teaching them by precept and the example of history that in art, as in life, temperance and refinement of conduct come from firmness of mind and elevation of spirit, and that these are the only sure means to these ends." All reasonable men must agree with the conclusions so well expressed by Professor Ware, and be content to await the development which must follow carefully-conducted educational training kept free from mere academic influences; and this Institute need not look further ahead than to continue steadfastly in the course already adopted, and thus eventually secure that all its members shall have had that thorough and systematic artistic, scientific and practical training, based on a sound general education, which will insure that the title of architect and membership of the Institute shall imply that its possessor may reasonably be expected to be a reliable and trustworthy adviser on all artistic and practical details, and also a well-educated man, standing at least on a level with the average of his clients in knowledge of all ordinary topics of art and general history, and superior to them in his special and technical knowledge. An architect will then, so far as personal characteristics may permit, in some degree combine the imagination of the artist, the intellectual clearness and precision of the mathematician, and the experience and readiness of the practical man with the culture and refinement of the educated gentleman.

The President put the vote of thanks, which was carried unanimously.

It was announced that at the next meeting, on March 15, Mr. W. St. John Hope, F.S.A., would read a paper on "Heraldry in conjunction with English Gothic Architecture."

**The following Artists** have been awarded gold medals at the Florence Fine Arts International Exhibition:—(1) Leon Bonnat, *Portrait of Ernest Renan*; (2) Hendrick Mesdag, *A Landscape*; (3) Aimé Merot, *Picture of St. Jerome*; (4) R. Lepsius, *Portrait of Ernst Curtius*. Mr. Frank Dicksee's *A Reverie* was classed next in order of merit.

## GESSO.\*

**G**ESSO work, so called, one of the minor byways of art, is a means of embellishment which touches on the one hand painting decoratively combined with a treated surface, and on the other modelled relief decoratively combined with colour.

On the labels attached to many specimens of gesso work at the South Kensington Museum (chiefly on the west side of the Italian Court) the two terms gesso and stucco are used almost indiscriminately. One reason for this may be in the fact that it is by no means always easy to tell whether a piece of work was executed in gesso or stucco, using the terms with a distinction which I shall hope to explain.

In the substances usually employed by the gesso worker, all the binding, the hardening, the cohesion is given by the drying and hardening of glue and oil; in stucco, on the contrary, these ingredients, so far from being necessary, can be injurious. It is the difference between carbonate and sulphate of lime, calcium the metallic basis of both. In gesso proper, whitening or chalk is used, the carbonate, which may be washed away by water; in stucco the sulphate is used, such as plaster of paris, which will set under water. Stucco depends on the re-formation of gypsum by uniting with water, sulphate of lime being present in one form or another in all true stucco. It follows, therefore, that gesso would not be used for exterior decoration. Much that is executed in stucco can be equally well executed in gesso. It is usual, however, to execute heavier modelling and higher relief in stucco; for although in stucco has been executed very fine work, it is true the slightest fine raisings of surface are rendered most happily in gesso, contrasting them not as to methods of manipulation, but as to nature of substance. It is roughly true that gesso is for the brush and stucco for the modelling tool, yet gesso can be used very stiff and stucco very thin.

Not only the methods of manipulation, but even the substances insensibly pass from one to the other. Plaster of paris will mix with gesso that has oil in it, and yet will seem to retain some of its self-setting power, and a considerable portion of whitening may be mixed with plaster (1 in 3) without injuring its setting. He who works gesso in higher and more modelled relief will find himself ere long working also in stucco. Yet the gesso worker will be surprised to find how much more than brushwork he can do with gesso, and still be using substantially gesso only.

To give the derivative meaning of the two words gesso and stucco would perhaps make the distinction clearer, but an Italian dictionary does not elucidate the matter. It only tells what gesso and what stucco is. It does not say what were the meanings of the words before they were used by the artist, or how the use of the words came about. (I shall be gratified if anyone in the audience can enlighten us at the end of my paper.)

Though the subject of this paper is gesso it has nevertheless seemed useful to touch on kindred stucco-work, and especially since it is very difficult to speak of either historically apart from the other. The term gesso, however, will, whatever the manipulation, be employed only for that which has not lime in it in any active form.

The glue or oil, or both, which have been already spoken of must have something to bind, which also will give them substances such as whitening, powdered chalk or killed plaster of paris. Other substances have at times been added, such as pumice powder and many others. At one time, so we are told, German artists used to mix finely-ground honestone with their gesso. Resin may be melted in the oil, and to resin, oil and glue may be added a very small quantity of pitch melted in turpentine. The resin in the oil helps to give the gesso a hardness. The oil and the pitch dissolved in turpentine at least help to protect it from injury by moisture. Very little of the oil is required, less resin and still less pitch. It may be remarked that many leave out the resin, some leave out the oil, and very few use pitch. By shaking them together, water and oil form a mechanical mixture of a milky appearance, used by some as a vehicle in oil-painting. To this mixture add whitening, and a gesso is formed which hardens into putty as the water dries out of it. The proportions for a pot of gesso are 10 oz. of glue, 2½ pints of water, 8 oz. of resin, 1½ pint of oil, 2 oz. of pitch, ¼ gill of Venice turpentine; of these take 6 parts of the glue-water, 1 of the resin oil, and 1-16th part of the pitch. One use of the pitch is that it helps keep the glue from going bad. If the glue goes sour the gesso of course, will not harden; but gesso may be kept for months after being made and yet remain good. A rough rule for the consistency of the glue-water is to make it so that it will only just set into jelly when cold. For the convenience of weighing the glue, it may be remembered that Scotch glue has the property of becoming flexible without getting sticky, after soaking in cold water for twenty-four hours. In such condition it may easily be cut with scissors, and it is convenient to keep

\* A paper read before the Applied Art Section, Society of Arts, by Matthew Webb, on Tuesday, March 2, 1897.

it in store in small weighed parcels and labelled. A store of jellied glue may be kept for some time by putting in a few drops of creosote or oil of cloves. When remelting a little water must be added to allow for evaporation in heating. White resin is the best, and if the student would be very particular he may use Venice turpentine in which to melt the pitch; but as a matter of fact the ordinary oily turps at the bottom of the tin brush-washer will do very well. Some put in Venice turpentine without pitch. Then there are, to be melted separately, resin in oil, pitch in turpentine, and glue in water. Having thrown these together and heated them up again, into the mixture stir whitening either carefully rolled and crushed in the dry state or previously well soaked. If soaked less water may be required in the solution of glue. The whitening sold as "gilders' whitening" is the best to buy, and the student will be surprised to find how much whitening the mixture will take before the gesso loses its very decided liquid character. Stir the mixture with the whitening in it well together, and always when possible keep it covered from the air till it is cold, otherwise the skin which would form is tiresome. With whitening glue is made a gesso for use with water-colour. At the consistency for the brush, gilders call this "thick white." A similar gesso was frequently used under gold by the illuminator in days when a page was not only for perusal, but for the pleasure of the eye. Gilders' stopping is whitening and glue at the consistency of dough. The ordinary trade "compo" with which frame makers make the ornament on frames is practically gesso, and may be softened for use by steaming. (Exhibit steamer with soft thick gesso.) Putty used by glaziers contains oil and whitening; with the addition of glue this would be gesso. In the resin varnish of commerce there is resin dissolved in oil, and at a pinch some of the various driers made for the house-painter's use would make gesso with glue and whitening added. Once get hold of the principle and there are many things which can be adapted.

Gesso will be required at different consistencies for different purposes. Naturally, if the proportion of whitening is increased so also is the stiffness of the gesso; it may be necessary, in order to make it bind, to put more glue in proportion to water, and an extra proportion of oil to keep the whole from cracking as it hardens. This gesso would be used for heavier relief. In thin gesso, for very fine work, such as the patterns on borders of robes, the oil may be left out altogether, with the glue also weak. As a rule, in working gesso the stronger glue is wanted in the earlier stages, the oil rather in the later; there it helps to give a finer surface finish if needed, and to protect the surface from moisture. With water and oil the final surface, if desirable, can be polished quite as fine as ivory, not that it is suggested there is any advantage in smoothness. It is always unsafe to put gesso strong of glue over gesso weak of glue; and fresh gesso over old dried gesso, without stopping the suction first, courts disaster. The dried gesso has an absorbent surface, which is just what gesso does not well adhere to. The suction may be stopped by shellac, thinly or thickly dissolved in methylated spirits or naphtha, or by thin glue water or both. The white polish of commerce is practically thin shellac, and patent knotting thinned with naphtha occasionally answers the same purpose, which is to choke the pores of gesso up with a hard gum, left behind after the spirit has evaporated. It is not possible to exaggerate the importance for the durability of the work of this incessant stopping of suction. The student may be impatient of the trouble, but safety is insured by stopping first with very thin shellac, and just before laying on the next gesso damping the old with very thin glue water. It is true that it will discolour the work, as will the oil in the gesso, but where the gesso is not depended on for colour, but will ultimately be finished with paint or gold, the discolouration will not be harmful.

Having made the gesso composition, the student wants a ground to work on and non-absorbent. Gesso will adhere readily to wood, straw-board, papier-mâché and similar foundations properly prepared with shellac, &c. To unprepared wood gesso adheres not too well, but firmly to glass and glass to it. Whenever practicable, however, the best of all grounds is one itself of gesso laid into canvas, the meshes of which afford hold to the gesso, while a wood panel, if it be underneath the canvas, is to some extent secured against cracking.

The coffer-front, No. 318 in South Kensington Museum, shows canvas under the gesso.

In a description of process it is always interesting, if not positively instructive, to instance from old work. Earlier paintings, in so far as they were "temper," were in a sense in water as distinct from oil colour; they, together with the later, though still early oil pictures, were mostly painted on panel. These panels were faced with a gesso priming, the gesso frequently laid in canvas over the panel. In the National Gallery, in room II., may be seen work of the early part of the fourteenth century by Duccio di Buoneseugua, by Pietro Foreuretti and others, which show this practice. In these pictures the panel is incorporated with the frame, and the ravages of time reveal, not only canvas underneath the gesso

facing of the frame, but also underneath the gesso priming of the panel—a finely woven but, compared with the size of the panels, a stoutish canvas.

It may be something too much of a fashion to trace methods back to the valleys of the Nile and Euphrates, but the nineteenth century, like the sixteenth, has its Renaissance; and though in a revival one may make the paralysing mistake of seeking too much in the past for authority and precedent, it affords a respectable sense of establishment to be able to discover in the land of the Pharaohs gesso traditions. In one form or another gesso they used for the surface finish of their sarcophagi. Where better shall the student look for the use of canvas with gesso than to the Egyptians who used linen so much, and habitually manipulated soaked linen for embalming purposes? Speaking of gesso as a priming, it has from time immemorial been used to cover wood, carved or not, intended for colouring—see carved wooden statuettes in South Kensington Museum—and this practice may have suggested the priming of picture panels. The frame-maker to-day covers wood with what is practically gesso before proceeding to gild it. It was also used to give surface finish before colouring to stone-carved effigies, such as those to be seen here in London, in the Temple Church, Westminster Abbey, &c.

While on the subject of these grounds one treatment of gesso may be taken into consideration which, in early work especially, gave such interest and value to the effect. The dry gesso ground very well takes a kind of engraving which, when gilded, yields a delightful play of light. When the Florentines would paint a wing, the pattern on robe, curtain, or cushion, rays of light, or a repeated diaper on background, the knife, stylus, or punch came into use. The glory you see radiating on the figure of the Christ in an *Assumption of the Virgin* (see Fra Angelico) is done by engraving ruled lines into hard gesso ground, a method which was turned to many accounts. The lines were of course engraved before the gilding and execution of the painting; and you often see, even in so careful a painter as Fra Angelico, that the painting has not been too nicely allowed for, and has had to encroach on the graven lines.

We need the glint of gold to get a full play and change of light and effect; radiating lines would be of little use in the glory unless the background were gilded afterwards. (See Fra Angelico.) Over the gold very beautiful effects of colour have been obtained by glazing. Very fine lines, especially in illuminated manuscripts, could be pressed in after gilding; but it should be remembered that gold leaf at that time was used thicker and richer than the leaf ordinarily used to-day.

This treatment of the ground is that found much later than the middle of the fifteenth century. In that beautiful work in the National Gallery by Lippo di Dalmasio (Room V., Ferrarese and Bolognese School), a Madonna and child, with sun-glory, a moon and angels, in effect broad and decorative, in design almost archaic, the painting is without any treatment of the gesso ground by incision or otherwise.

For examples of this incising, attention might be called to the following works in the National Gallery:—The large Fra Angelica Annunciation, on the wing of the Angel Gabriel (Room II.); the background of the Cinabue (Room III.); rays round the figure of Christ in the long Fra Angelico Predella (Room II.); Madonna of French work, fifteenth century, in the background, and in a halo which is placed high round the head, elaborately-chased diaper, or more properly punched (Room XIV.); Marriage of Virgin towards end of fourteenth century, Siennese School, Nicolo di Buonaccorso, frame and panel incorporate, frame brush, panel chase and punch, even under draperies (Room II.).

There are others which there will be occasion to speak of later.

At the consistency of cream gesso will flow from the brush, constituting what is called "brush modelled gesso." A long thin brush is best for most purposes. I prefer a hog; never a quill. The "rigger" brush used by coach painters is a good one. As the available brush is practically the drop of gesso hanging from below the hairs, you will see that long lines of slight or no curve are not easy to do. Some of the processes by which china may be decorated with modelling partially illustrates the manipulation of brush gesso. Some of the work is a little like painting on with slip. The projections and gradations of form can be got by brush stroke after brush stroke, somewhat after the manner of *pâte sur pâte*. Another method is to lay with the brush what I might call cloisons of gesso round a form; and then when the walls are dry and stopped flood gesso into the interspace, rather after the manner of cloisonné enamel.

Except as a diaper or in thin floral decoration this brush-gesso work is of course hardly suitable for design intended to cover any large area, for large character of work, or for work which aspires to distinction or elaboration as modelling. The work is beautifully shown on Italian marriage coffers, of which we have such fine specimens at South Kensington Museum. In them the gesso-worker was generally contented to leave decorative details, more or less high, soft and fat as they flow

from the brush. Sometimes sharp edges to angular facets suggest a 'supervising scraper' with a knife; and, indeed, for a similar purpose the worker may find it useful to keep by him different finenesses of sand and emery papers. Frequently when the outline was required to be sharp the ground was punched with little dots. These not only gave difference of texture, but being brought up to the floral or ornament sharpened the drawing. The dot can be made in gesso still soft, but a line cannot well be scratched or chased except into hard gesso.

In the case of the human figure, the face and features were generally left to be made out later by the paint-brush; the head being a mere general shape, vaguely and softly raised in gesso on the ground.

Many of the ornamental forms and conventions on archaic pottery are eminently adaptable to gesso work, and the very manipulation of the long thin brush, charged with fluid but thickish paint, after the manner of such decoration, is suggestive of brush-gesso.

Before quitting this part of the subject attention may be called especially to the principle that brush-gesso is typically gesso-work. It thus constitutes an art which a painter can naturally take up, for it is in very low relief, largely depends on drawing rather than section, and is first and foremost brush-work.

Both more quickly and more satisfactorily than by brush-gesso, heavier modelling and higher relief to any desired projection may be obtained by incorporating with the gesso various fibres.

These, such as tow, cotton-wool, horsehair, wood-shavings, &c., may be pulled out or cut up and soaked in the creamy gesso. In a similar way even paper and rag may be manipulated and left stiffening in the hardening gesso to a required shape. Remembering that gesso and non-absorbent substances will adhere to each other, many things offer themselves to the worker's ingenuity, such as wire, and indeed any pieces of metal and glass. Cardboard or strawboard and wood of course may come in useful, first painted over with shellac; knotting or glue. String may also be mentioned as frequently of use.

For the use of string, probably wood, and glass with gesso, reference may be made to the raised work in the St. Peter of Creveillé's big altar-piece in the National Gallery. (Room VIII.)

There is another mode of using gesso, not perhaps as interesting as it is instructive. With or without fibre, gesso may be mixed stiff enough to take squeezes in. Naturally in this stiffer gesso, to keep it from cracking as it hardens, stronger glue is required with more oil to bear out the increased bulk of whitening. The following proportion would be a very strong gesso for squeezing in:—6 lbs. of glue in 4 pints of water; 3 lbs. of resin in 3 pints of oil;  $\frac{1}{2}$  lb. of pitch in 1 gill of Venice turpentine.

(To be concluded.)

#### GLASGOW ECCLESIOLOGICAL SOCIETY.

THIS Society met on the 23rd ult. in Woodside Parish Church Hall, the Right Rev. Bishop Harrison in the chair. A paper was read by the Rev. David Watson, Woodside, on "Some Aspects of Recent Church Architecture." The lecturer spoke of the present-day revival of sacred art. The long years of neglect and the many causes of distrust and suspicion of everything ecclesiastical have somewhat taken end. But there is no society or corporate body to which an appeal can be made for sympathetic and intelligent guidance in the erection of ecclesiastical edifices on right lines. A cry is raised for the erection of a church; a sum of money, less rather than more, is subscribed; the usual grants are promised by certain trustees or committees in authority, and in a short twelvemonth thereafter the congregation is worshipping within the church walls. In too many cases the builders of these edifices are summoned together again because a great renovation is required; not because the church has become too small, but because the congregation's conception of the fitness of things has outgrown the place they sit in. What is often wanted is a catholic ideal to start with. It is the district that is to be served and enriched by the structure that is proposed to be built. Some other *raison d'être*, therefore, than rivalry or contradictoriness should determine the size and decide the style. It is not meant as a plaything for a short-lived decade or two, but meant to be the home and trysting-place of all that is reverent and humble, all that is highest and best for generations yet unborn. At the door of every effort at church-building stands the solemn interrogatory, To what great purpose and chief end? For faith or belief, for emotion or understanding, for priestcraft or the preaching of the Word, or both it may be? We too often set about to build church edifices not so much in response to the religious consciousness of the country as in imitation of the achievements and methods of the past. We do not seem willing to acknowledge that churches, like children, outgrow their clothes; and that what was fitting and appropriate 500

years ago is simply unwearable and absurd in these days. The rule of nave, chancel and transept may be quite as admirably suited to Protestant purposes as it suited the sacerdotal purposes of the Middle Ages, but not without a large measure of readjustment, in response to the intellectual and religious attitude of to-day, quite as much as that same all-important factor dictated this particular design in its day. And hence the mistake of playing at a pretentiousness quite meaningless in Presbyterian churches, as, for instance, the erection of a rood-screen where no distinction between the clergyman and the people really exists; the attempt at a reredos where no reredos can possibly be wanted; the use of gable turrets as chimneys and the erection of chancels too diminutive for any real use. We are told betimes that the main purport of church-going is for worship, but those same people do not seem to know that the soul may be filled with a rapture and a reverence which are the very embodiment of worship far more readily by a manly and wholesome ministry of the Word than the mere singing of so many verses of doggerel to a languishing or a lusty tune as the case may be. The shunting of the pulpit to one side and the placing of a communion table or so-called altar at the farther end of a church is not only not in accordance with primitive custom, but is no furtherance of the church's chief use. The paper gave rise to a lengthy discussion, in which some of the views of the lecturer were subjected to considerable criticism. A very hearty vote of thanks was given to Mr. Watson for a lecture of great interest and excellence.

#### SOUTH KENSINGTON MUSEUM.

A COMMUNICATION from M. Charles Yriarte, inspector-general of Fine Arts in France, several of whose books have been noticed in *The Architect*, has been handed to the Paris correspondent of the *Times*, who gives the subjoined translation of it. M. Yriarte was commissioned to guard and classify the works of art collected in France by Sir Richard Wallace and now bequeathed to the British nation. On behalf, therefore, of the artistic patrimony of the world he thinks it right to intervene in the question of the completion of South Kensington Museum, and Englishmen will doubtless applaud such intervention by a foreigner actuated by a love of art and a desire to serve it. He writes:—

To whatever country he belongs a foreigner cannot remain insensible to the spectacle offered by the outburst of affectionate gratitude of an entire people, eager to celebrate the jubilee of the reign of their sovereign by an act of beneficence for the nation itself. It is, however, only from the point of view of the interests of art, of the development of taste, and of the technical education of artisans of every class and every country, that I would plead after so many others the cause of the completion of the South Kensington Museum. Lord Playfair's proposal responds to an imperious necessity, and the occasion of realising it is propitious. Consider the state of things in England at the beginning of Her Majesty's reign as regards the education of the art-worker and what is known as public taste. In 1837 there was a museum of decorative art and a special school for drawing. In 1857—a year doubly celebrated in the history of art in England—the Queen and the Prince Consort inaugurated the South Kensington Museum, and in Manchester was opened that prodigious exhibition of England's art treasures to which the leading French artists and the most celebrated critics went as on a pilgrimage, to return astonished at a spectacle which was to them a veritable revelation.

The South Kensington Museum soon began to develop. Whole collections were bequeathed to it; the treasure augmented day by day. Amateurs consented to place there for long periods precious collections enlarging the field of study. The directors of the Science and Art Department, ingenious in the search for the means of propaganda, opened annexes, multiplying thereby centres of public instruction and the objects destined to awaken thought in the minds of the artists and artisans, and—an instance of popularisation unique in Europe—they had the idea of the itinerant museum, to be transported from town to town, to stop in each place long enough to be seen and appreciated, and thus to place under the eyes of the artisans in every centre the objects best adapted to the genius and tradition of the country.

The exhibitions of the English schools, by the evident progress made by their pupils, soon recompensed these efforts. The level of public taste was much raised. Art applied to industry becomes the great preoccupation, and powerful minds, fertile imaginations, daring disinterested writers and artists, take the lead of the movement and turn it into new channels. There was too great a tendency towards archaeology. With fresh and renewed efforts everything is transformed. Mérimée, our great writer, archaeologist, artist, general inspector of historic monuments, returns from London thoughtful, and in a famous report to the Minister of Education utters a cry of

alarm. Our decennial exhibitions had given us for some time the first place. Our great art industries now became uneasy. England had overtaken and was about to outstrip us. The movement did not slacken. Who would think, in presence of such results, of denying the share in them of the South Kensington Museum, which had become the most fruitful source, the most colossal dépôt, of *objets d'art* of all sorts and the most varied and complete types and examples, capable of favouring the development of artistic taste, from its simplest forms, as seen in the artisan who overcomes common material, transforming it into a precious object, to the creators, the architects, painters and sculptors, who embody their dreams and fancies, giving them form, colour and life, and awakening thought in us while making a sanctuary of the home where we live?

To-day for all of us foreigners South Kensington is a Mecca. England there possesses the entire art of Europe and the East, their spiritual manifestations under all forms, and Europe has been swept into the stream in imitation of England. Berlin, Budapest, Vienna, Nuremberg, Basle, Madrid, St. Petersburg, Moscow, the large towns of America itself have now their South Kensingtons; but in the original one of England still unfinished, where the splendour of the start (excessive, as it seems to me) contrasts with the inertia of the last fifteen years, the inconceivable treasures are becoming so much heaped up as to be a veritable obstacle to study. How is it possible to study this extraordinary series of textiles of all times and countries, ranged one upon another, overlapping and hiding one another, without proper perspective and proper light? And the draperies, the embossed Italian and Spanish leathers, the carved wood, the ironwork, the *cassoni*, the lacquer, placed at such an elevation that one is obliged to mount steps to study their form and colours. And the unrivalled collection of casts of ivories from antiquity to the present time, the precious work of Layard, that unique cast the plaster of which is equal to the original. The collection of musical instruments is quite invisible in a miserable light like the *azulejos*, the mosaics, and the decorative tablets of the Persians. There will presently be no knowing where to stow the model, one-third size, of the execution of the Camerino of Isabelle d'Este, Marchioness of Mantua, where after three centuries we have reproduced the works of Mantegna and Costa, which fate has brought to our Louvre museum.

It is not for me to give an opinion on the architectural part of the work to be accomplished. South Kensington is especially a museum for study, and for study a mere box is sufficient, spacious, well-lighted, with as few projections as possible, of no exaggerated height, easy of access, but, above all, with space and light, and lastly, from due respect for art, with decent surroundings, a fine entrance and no unsafe neighbouring buildings. The architects will be unable to protest. They know that in architecture the external expression of a requirement fulfilled, a form appropriate to the object aimed at, inevitably gives a monument its character. Ornament is neither in the material employed nor on the wall, where it sometimes distracts attention; it is especially in the art object itself, and imagination can find ample scope outside. I desire, therefore, for the entire nation the realisation of Lord Playfair's proposal, the completion of the Victoria Museum for the advantage of art studies and the development of public taste, and this out of gratitude for the facilities of every kind found by foreigners of all nations in the great English public dépôts.

#### ST. GABRIEL'S CHURCH, PIMLICO.

THE Bishop of London consecrated, on March 1, the additions which have been made to St. Gabriel's Church, Pimlico. The church is a well-proportioned Gothic building with three aisles, chancel and western tower and spire, but the beauty of the building was not a little disfigured by the unsightly side galleries which have just been removed. During the incumbency of the late vicar, the Rev. J. H. Ellison, some improvements were made, and the removal of the galleries was contemplated. This has now been accomplished by the present vicar, the Rev. Canon Rupert H. Morris, D.D., through the liberality of the Duke of Westminster, the patron of the living, Lord Ashcombe and others.

The additions, which consist of north and south aisles, a new south chapel in memory of the late Rev. Brymer Belcher, the first vicar, a west gallery and a west porch, the gift of Lord Edward Pelham Clinton, have been carried out by Mr. John Thompson, of Peterborough, at a cost of some 6,000*l.*, from the designs of Mr. Arthur Baker, F.R.I.B.A., of the firm of Messrs. Baker & Turrill, in harmony with the original design, and have added to the size and dignity of the church.

The extra width given by the additional aisles and the double arcade on each side of the nave have increased the picturesqueness of the interior, which has also been enriched by the groining of the aisles' roofs and by the richly carved oak front of the west gallery carried on a stone arcade. The chancel has also been beautified by a new east window, designed by Mr. Kemp.

#### LEICESTER SOCIETY OF ARCHITECTS.

THE annual exhibition of students' work and distribution of prizes in connection with the Leicester and Leicestershire Society of Architects was held at the Museum Buildings on the 23rd ult. The prize drawings of the local students, together with a number sent down from the Royal Institute of British Architects, were exhibited in one of the Art Gallery rooms, and formed a most interesting collection. Mr. Chas. Baker (president) occupied the chair, and there was a numerous attendance, among those present being Messrs. E. Clephan, A. H. Paget, S. P. Pick (hon. secretary), A. Spencer, C. Kempson, A. H. Hind, H. H. Thomson, W. A. Catlow, W. H. Topott, J. W. Simpson, and a number of students and friends.

The President, after opening the proceedings, called upon Mr. Paget, who gave a very able review of the students' works.

The prizes were then distributed by Mr. Clephan as follows:—For a design for entrance lodge and gates, the first and second divided equally between Mr. Shirley Harrison and Mr. A. Herbert; for measured drawings of old work, first Mr. A. Herbert, second Messrs. A. B. Widdowson and Traylen (bracketed together); for architectural sketches, first Mr. A. Herbert, second not awarded.

A vote of thanks was passed to Mr. Paget for his review of the students' works, to which Mr. Paget replied. A similar vote was also passed to Mr. Catlow for his duties as secretary of the prize committee, and to Mr. Baker, the president, and the proceedings terminated.

#### Architecture and the Public.

SIR,—Will you permit one of the laity to utter through your columns a mild protest against the continual girding of some architects at the public for their lack of interest in architecture, and their absolute want of taste in the architectural art? The accusation is neither just nor wise, nor is it altogether true, and it is sometimes expressed in a way that becomes a little offensive.

As a matter of fact, there is nothing except our ailments and perhaps our politics, in which we average men take so much interest as architecture. We will confess at once that it is not a very enlightened or intelligent interest, which is perhaps the fault of our teachers rather than our own, but it is a keen one all the same.

If the average man visits a new town he spends his leisure looking first at its old churches and then at its modern public buildings; if he revisits it he is eager first of all to see what new buildings have been erected, and when he comes away it is always with the best photographs he can get (if in France with those large ones of detail, which seem nowhere obtainable in this country except at Southwell).

Further, the printsellers say that etchings of buildings go off more quickly than almost any other portion of their stock, while the public reference libraries of our large towns contain certainly a due proportion of works on architecture, which the librarians can testify are as much consulted as the books of any other department.

Of course the average man knows nothing about the science of architecture, that he wisely leaves to the expert, knowing that the amateur lawyer has a fool for his client; his interest is æsthetic, antiquarian and historical, and of the outlines of the history of the art and of the characteristics of its main divisions he knows about as much as the general run of its practitioners. If he can afford it he is pretty sure to have Ferguson on his shelves; if not, there will be the handbooks of Messrs. Roger Smith and Poynter, or the more recent works of Statham or Fletcher, and possibly a monograph on the great church of his neighbourhood.

As to the oft-repeated taunt that the public loves excess of ornament, plenty for its money, this is grotesquely untrue. What the average man does like is simplicity and repose; his grievance with so much modern architecture is that it is *jumpy* and after passing through some recent West-end streets he finds it refreshing to take a walk even down Harley Street.

The man who thinks of building himself a house has a clear idea of what he wants, but he does not often get it, as he is influenced by his architect, who is not always a Shaw, a George or a Bidlake. His ideal of a home is a house like those late Stuart or early Georgian houses still common in the country and around London, square and solid, of warm red brick, with narrow windows whose panes are small and their bars thick and painted white, the whole crowned by a great overhanging cornice to give it dignity, and he may or may not have an individual preference for a central pediment and pilasters. This sort of house he calls comfortable and dignified, or he may use General Ople's solecism and describe it as gentlemanly. To this ideal he has remained constant through good report and

ill report, and it was pathetic to see the middle-aged men of the "fifties" and early "sixties," when architects had come under the influence of Mr. Ruskin or the thumb of the Cambridge Camden Society, pretending to admire the eccentric habitations they were forced to live in, with their pointed windows, their excrescences, their roofs of parti-coloured slate and their top-heavy crestings; or, a little later, the early vagaries of the Anglo-Dutch style. Fortunately, there are signs that some of our best architects are coming round to our opinion.

With regard to street architecture in towns, we plead guilty to an affection for the architecture of the Bloomsbury estate, as originally planned—each block treated as a whole, with a long straight massive cornice, relieved, as in Russell and Tavistock Squares, by a more ornamental treatment of the centre and extremities. This is, no doubt, an evidence of Philistine taste, but it is, too, an evidence that we are by no means indifferent to the art.

I should say more, but I fear I have already trespassed too far on your space.—Your obedient servant,  
A LAYMAN.  
March 1, 1897.

SIR,—After reading the report of the lecture on "The Architect and the Public" lately delivered by Mr. Bidlake before the Architectural Association in London, and which is well worthy of perusal, I could not help thinking that many of the difficulties the profession have to contend with, and the lack of respect it should command, can be traced to the actions of individual members of it. I will give you a case in point. About a year ago I was commissioned by the vestry of a church, of which I am a member, to get carried out reseating, painting, ventilation, and other works. My plans were approved of, contracts were entered into, two of the contractors, the painter and an ironmonger who got the contract for the heating alterations, being both members of the said vestry. Now everything went on smoothly, the joiner's work was made and ready for fixing in position, when a change unfortunately took place in the rectorship. Shortly after this event I was obliged, in discharge of my duty, to write to the painter for an explanation as to why his men were not allowed to make up tints to my satisfaction, and also to the ironmonger in regard to defective work done by his men. The painter did not reply to me, but went to the ironmonger, who came and wished me to go and allay the irritation of the painter. This request not being acceded to, the painter took my letter to the rector, and the rector, after consulting the ironmonger, decided to have a meeting of the vestry, which meeting I attended, as did also the painter and ironmonger. The rector stated that after consultation with the ironmonger it was considered advisable to call the meeting to appoint a committee to confer with the architect when anything took place (the reader will understand what that meant). I, seeing the state of affairs, asked to get read my letter to the painter; the rector would not allow this, but said that I (the architect) had no right to give any instructions to the workmen but only to the contractors; forthwith there was a committee appointed, the painter and ironmonger taking part in the selection, and after this committee was appointed it was proposed that ladies should be consulted as to the painting, and the painter who had signed my specification and agreed to do the work according to my instructions strongly supported the proposal. I naturally objected to the proceedings, but was told by the rector that I had no right to dictate. I did not attempt to do so, but took the more effective course of sending in my resignation the following day. This caused a hastily summoned council to be held, at which one of those present said that I had not left them a way to get out of it; consequently I received a letter saying the vestry felt keenly the position my action had placed it in, and as it had no alternative, my resignation was accepted, and I was requested to send in the contract documents. This I answered by sending in my account, which was paid before I complied with the request. Then a deputation went architect-hunting, made arrangements with one of the most respectable firms in Ulster, but when the said firm came to understand the matter it declined to have anything to do with it, and so the contractors had a free hand for more than a month, until a member of the vestry got an architect to come, and when asked if any of my work was condemnable he had to admit that it was not; but he wished to change the pitch pine gallery front for one of open ironwork. This pill was rather large to swallow, and he had to pocket it. Not getting his own way in this, he refused to take the work in hand; but after a short interval he came back and got my work carried out. Now the facts of the case are well known, and I leave it to your readers to say if it was a gentlemanly and professional action to take my place under the circumstances. However, I can afford to be generous, as I know what has taken place since, and I have had the satisfaction of being told by several of the leading members that the vestry very much regretted that I was treated as I had been. I may also say that some time back this same architect, through

a friend of his, tried to oust me from my position in another place, and, in order to secure the appointment, offered to prepare plans for a certain sum, and to allow part of it to merge in the commission should the work be carried out, and this at a time when I was actually engaged getting work done for the same institution, which work, and that previously done by me, gave entire satisfaction. I may add that where I practise is more than thirty miles from where my plausible friend hails from, and if this comes under his notice I hope he will reply, as I will then have an opportunity of referring to some of the work done by him.—I am, sir,

AN ULSTER ARCHITECT.

#### Cathedral Series.

SIR,—It seems hardly possible for me to add to the arguments or supplement the earnest requests of your gifted correspondents for you to print all the Cathedral illustrations separately; yet may I suggest that if this were done on thin paper, similar to that used for the letterpress, the cost would be infinitesimally increased, the patchwork of the "two numbers" suggestion obviated, and the value of the series greatly enhanced.

May I also be allowed to remark that some years ago when a number of correspondents pointed out to Messrs. Cassell & Co. that the letterpress behind the centre art picture spoilt the clearness of the same, they immediately fell in with our suggestion, and afterwards printed the second art plate without the letterpress backing.

Could you see your way clear to fall in with these views for the future, and would reprint the text blocks at a nominal cost—say 1s.—I feel positive that thousands would avail themselves of the opportunity and obtain a series which undoubtedly forms an epoch in the history of illustrated journalism.—I am, sir, yours obediently,

CHAS. BEETLESTONE.

4 Oak Terrace, Bushey Hill Road,  
Camberwell, S.E.: March 2.

#### GENERAL.

Sir A. W. Blomfield, A.R.A., has prepared plans of a massive tower to be erected at the south-west end of the parish church of St. Mary's, Chatham. The new tower will form part of a general scheme of restoration, which is estimated to cost about 8,000l.

Mr. H. S. Eele Shaw, Professor of Engineering in University College, Liverpool, is to receive the honorary degree of LL.D. from the University of St. Andrews. Another recipient is Miss Eugénie Sellers, editor of Furtwängler's "Masterpieces of Greek Sculpture" and other works on art.

A Bust of the late Lord Randolph Churchill is to be placed in the precincts of the House of Commons. The commission will probably be given to Mr. Waldo Story.

The Bill seeking powers for making a railway from Praed Street, Paddington, to Willesden, which was to be worked by electricity or cable power, has been withdrawn.

The Gold Medal presented to Dr. Nansen by the Royal Geographical Society was designed and modelled by Mr. Allan Wyon, F.S.A. On the obverse is a portrait of the explorer, on the reverse a representation of his vessel, the *Fram*.

The Goncourt Collections of drawings and other examples of the art of the eighteenth century have realised at the Hôtel Drouot, Paris, 925,526 francs, which will be available for the proposed Academy.

C. A. Sainte-Beuve, who was the greatest of the modern critics of France, was born in Boulogne in 1804, and was the most distinguished man of letters produced there. It is proposed to erect a bust of him in Paris; but all that Boulogne has contributed towards the cost is a sum of 50 francs.

In Venice the penny steamers which run on the Grand Canal have proved so convenient to the inhabitants that the municipal authorities have made an arrangement with the steamboat company for the running of the steamers from Rialto's bridge to the railway station up to midnight.

The Building Trades' Exhibition at the Royal Agricultural Hall will be open from March 20 to 27. The Right Hon. the Lord Mayor, accompanied by the Sheriffs of London, will open the exhibition on Saturday, March 20, at noon. The following official visits will be paid and meetings held during the week:—Saturday (opening day), visit of the Architectural Association, at three o'clock; Monday, visit of the Association of Municipal and County Engineers, at four o'clock; Tuesday, annual meeting of the Institute of Clayworkers; Wednesday, visit of the Builders' Merchants' Association of London; Thursday, conference of House Painters and Decorators, at 7.30. Architects' drawings on exhibition, also loans from South Kensington Museum, Corporation of London, City companies, &c.

# The Architect.

## THE WEEK.

THE annual general meeting of the subscribers and donors to the funds of the Architects' Benevolent Society was held on Wednesday afternoon in the council-room of the Royal Institute of British Architects, Professor AITCHISON, A.R.A., the president, occupying the chair. The annual report of the Council stated that the progress of the Society was maintained. Forty additional annual subscribers had joined. But as applications for assistance were made from all parts of the country the sum received was still inadequate. The sum expended in relief was 604*l.* 15*s.*, while the subscriptions amounted to 460*l.* 15*s.* In addition, pensions to the amount of 70*l.* were paid. The Council expressed regret at the resignation of the honorary treasurer-ship by Mr. ARTHUR CATES, who was not only a liberal donor, but promoted the usefulness of the Society by time and labour. When he accepted office the subscriptions amounted to 308*l.* They are now 453*l.*, and the invested capital has been increased from 7,426*l.* to 9,893*l.* Mr. W. HILTON NASH was elected as Mr. CATES's successor. The following members of Council were elected for 1897-98:—The President of the Royal Institute of British Architects, president; Messrs. WM. KIDNER, GEO. SCAMELL, ZEPH KING, GEO. INSKIPP, Colonel R. W. EDIS, ARTHUR CROW, E. A. GRUNING, G. T. HINE, ARTHUR CATES, ASTON WEBB, H. L. FLORENCE, J. T. CHRISTOPHER, SYDNEY SMIRKE and WM. GRELLIER, with Mr. PERCIVALL CURREY as hon. secretary. The President testified to the great benefit which had been derived from Mr. CATES's long official services. Mr. CATES, in replying, trusted that the Society would receive more liberal support from the architectural profession than had hitherto been the case. A vote of thanks having been passed to the auditors, Mr. HENRY HALL and Mr. WM. WOODWARD, and to the President, the proceedings terminated.

APPARENTLY the first approach to a legal definition of "rateable value" was given in the schedule of the Parochial Assessment Act of 1836, where it is supposed to be synonymous with "net annual value." In the Valuation Act of 1869 rateable value is said to be "the gross value after deducting from it the probable annual cost of repairs, insurance and other expenses, if any, necessary to maintain the property in a state to command the rent." In the Water Rate Definition Act of 1885 there is a return to the phraseology of 1836, for "annual value" and "rateable value" are taken as equivalents. The decision of Judge LUMLEY SMITH, Q.C., in the Westminster County Court, which has created much interest in the Metropolis, does not therefore strain an accepted phrase from its ordinary acceptation. The Grand Junction Waterworks Company sought to recover 32*l.* from Mr. MAXWELL DAWSON for water supplied to No. 161 Piccadilly. The question in dispute was the basis of the charge. In 1871 the rateable value was 160*l.*, and the amount charged was 2*l.* 5*s.* for the supply. In 1871 there was a change in the rateable value, and the water rate worked out at four guineas per annum, and that amount was paid. In 1882 the rateable value was again raised, and it was arranged that so long as Mrs. DAWSON lived on or occupied the premises the amount should not be increased. In 1893 the rateable value was raised to 250*l.*, and in 1895 to 334*l.* Under section 46 of the Companies Act of 1822 the company could charge 4*l.* per cent. on the value not exceeding 200*l.*, and 3*l.* per cent. if over 200*l.* Defendant said the amount he ought to pay was 4 guineas per annum, which was fixed during his mother's lifetime. His counsel argued that Mr. DAWSON was partner with his mother when the agreement was made, and could only be altered by the consent of both parties. The four guineas were paid for three years after Mrs. DAWSON's death, and were accepted without prejudice. The company had tried for 7*l.* a year, 7*l.* 14*s.*, and as much as 9*l.* The Definition Act said nothing about the raising of the amount from time to time with the rateable value. Had that been intended the Act would have stated it clearly and not left it to be inferred.

At the present time the company was supplying less water than they used to do, and yet they wanted to be paid more money. The Judge said that as the rateable value varied the water rate varied also. The agreement came to an end when Mrs. DAWSON died. Judgment was given for the plaintiffs for the amount claimed with costs.

AMONG the artists who appear to be survivals of a primitive state of manners in Paris was HENRI PILLE. He might have belonged to the times when it was a crime to draw from a living model, and therefore was obliged to assume a garb which suggested he was not entirely sane. There are strange figures to be seen in the Salon on vanishing days mixed with others who are embodiments of the most recent fashion plates, but PILLE continued to be unrivalled. It was well known that *concierges* sometimes hesitated before they allowed him to ascend the staircase. PILLE seemed to delight in shocking conventionalities, but the real cause of his get up was his indifference. His mind was absorbed by his art. A painter who could produce not only historic scenes which were correct in all their details as well as in expression of character, but was no less competent in dealing with illustrations for comic journals, might be excused if he were careless about his appearance. Too often men who adopt such mannerism as PILLE's are charlatans, but the painter was a hard worker as well as a man of genius. His outer aspect did not recommend him to the authorities, for he was not selected for any of those public commissions which he could have carried out with advantage for Paris or for the State. He found compensation in his presidentship of the Société des Artistes Illustrateurs, an appointment he worthily filled.

THE office of an expert or valuer in connection with the sale by auction of works of art is a desirable one in Paris. Everybody remembers the sale of the SPITZER collection a couple of years ago which attracted buyers from all parts of Europe. The amount realised approached 9,000,000 francs. The auctioneer paid M. MANNHEIM no less than 300,000 francs commission. The representatives of the late owner of the collection were dissatisfied that so large a sum should be deducted from the amount received from the collection. Accordingly an action was brought before the French Chambers for the purpose of reducing the sum. In defence it was maintained there was no excess in the amount received by M. MANNHEIM, whose valuation was borne out by the result of the sales. The judges are considering their decision.

CANADA has to depend mainly on imported cement. During the year 1895, out of 255,000 casks which were used no less than 223,000 casks were imports. England supplies about 45 per cent. and Belgium 25 per cent. Up to March 1866 the duty was 20 per cent. of the value, now it ranges from 33 to 52 per cent. In some cases the duty is found to exceed the cost of the cement. In consequence an immense quantity of inferior cement is employed in Canada, and ordinary mortar is substituted for cement. Protection may have its advantages in a country like Canada, but if within a few years bridges on railways and roads and other public works can no longer exhibit sound masonry, the cost of repairs will be more than an equivalent for any gain derived from an excessive tariff. If Canada cannot produce cement there is no native industry to be protected, and therefore, for the sake of a fiction, the country is saddled with the expense of upholding a kind of construction that would not be tolerated in Great Britain.

THE Dean of Peterborough announces that the portion of the north-west gable of the west front of the cathedral which it was found necessary to reset has been taken down, and that the work of resetting will be at once proceeded with. The stones have been found to be in an excellent condition, and will, with few exceptions, be replaced in their original positions. The mortar in which they were set had entirely lost its cohesive properties, and was reduced to a condition of fine loose powder. Dr. INGRAM adds that sufficient funds have been received or promised to complete the work at the gable, but there is still needed a considerable sum to carry out the architect's recommendations for securing the permanent safety of the entire fabric.

## QUANTITIES.\*

IT is imagined by some architects that if the public in general could be persuaded to read a history of architectural styles, or a treatise on building construction, or an investigation of the æsthetics of form, it would be an advantage for the architectural profession. But how can an ordinary reader be expected to realise the connection between the house in which he lives and the Parthenon, Beauvais Cathedral, the Whitehall Banqueting House, or other admired buildings? Nor in his home can he discover any difficulties of construction which were overcome. He may know by experience that parts somehow require repairing from time to time, but as he could not explain how the roof, stairs, floors are held together, or the variety of joints which may be in the hall door, he is likely to conclude that the science of construction can only be exemplified in works of a different class. As to æsthetics he is sure to believe the principles have more connection with the Japanese fans, bulrushes, blue plates, bows on chairs, and other discoveries of our time than with an architect's work. Better than any of the books we have mentioned as an aid to the conversion of the uninitiated would be a treatise on quantities. The best of all means would be the bills of quantities for a house which the person in darkness was about to build. But they affect him so closely, he could not be expected to take a philosophical interest in them, and he would have, too, a misgiving that the study of them was a snare. A book like Mr. LEANING'S, on the other hand, would be a revelation to him, no less astounding than the late Professor HUXLEY'S volume on the "Crayfish." Let us suppose he opens it by chance, as we did, at page 257. He will find there the quantities for "No. 1 Step-ladder." The name may at first puzzle him, but he will conclude it means stairs of a simple sort. He finds that a precise quantity of fir framed in cube feet is required, besides different areas of planing of  $1\frac{1}{4}$  inch rough batten landing, with open joints; of  $1\frac{1}{4}$  inch deal rough lining, and treads of rough framed; of 2-inch deal rough-framed strings; so many feet run of labour to rounded edge to 3 inches fir. There are, too, housings of treads, ogee cut ends to bearers, ends of bearers, &c., cut and pinned into wall. After the discovery of the elements of the "step-ladder," let him be informed that the amount of work required could not be ascertained unless all was shown on drawings, and it may then dawn upon him that if a whole building has to be treated in like manner the architect's commission for the preparation of drawings is not so easily earned as he imagined. When he also learns that the architect has to ascertain that the varied work described for the stepladder is carried out to the inch, it must be no less evident that so much microscopic scrutiny is also worth paying for. After going through the pages the representative of the public will discover that the "step-ladder" type is not continuously followed; there are some which are simpler and others more difficult. But it is sufficient to suggest how numerous are the distinct parts which are required before the simplest house is brought to completion.

The fact is, there is an analogy between houses and organic structures. The animal frame is concealed by an outer skin which in no way indicates the intricate construction which is beneath; and in houses the paint, plaster, room-paper, &c., cover a multitude of examples of constructive skill. How many occupants of houses are able to form a definite notion of a framed partition? They generally consider it to be a flimsy division between rooms which would not have existed if an honest system of building prevailed. An ordinary client is generally sceptical if the details of a window are put before him. They seem to him to be a case of much ado about nothing, or misapplied ingenuity, for he is confident that if he tested the drawings it would be discovered that the nails were somehow represented in plan and section. Until people are convinced that buildings are not the simple things they appear to be, that there is a veritable hiding of skilful work on which the stability of the building depends, they will not believe in the importance of architecture. They should

reason from the seen to the unseen, and the latter is the more important.

The ignorance of the public on the subject is revealed whenever men who are distinguished, and especially literary men, have to refer to buildings. CARLYLE was a mason's son, and might therefore be expected to know a little about construction. But on those occasions when he broke out against modern buildings he seemed like a child whose doll's house had come to grief. It might be supposed that when the Chelsea sage walked abroad of an afternoon, he was compelled to walk circumspectly on account of the houses which fell as he passed. In fact, nine tenths of the complaints against builders will be found to be inspired by ignorance of all that has to be done, and to remove that ignorance there is nothing to surpass a bill of quantities, even if it is only partially comprehended.

We are afraid, however, a long time must elapse before the public will consider it a duty to study such a book as Mr. LEANING'S. If he has been fortunate in reaching a third edition, the purchasers must be surveyors or aspirants to that profitable profession. The subject is now a common one in the evening technical classes, and so many are attracted by it there is a likelihood of many subsequent editions. Mr. LEANING and his publishers have undoubtedly earned the success they have obtained. It was announced in the second edition that "the system of measuring suggested in this book is for the greater part that adopted by Mr. THOMAS M. RICKMAN, and consequently needs no further recommendation," and since then no better system has been evolved. But it should be known by would-be surveyors that a book alone will not make a thoroughly practical surveyor. There must be some experience of the actual things which are anticipated in the bills, and of the time and labour needed in their production. It is not ideas merely which the surveyor has in his mind; he should be able to realise whatever is inventoried as if it existed.

That facility in discriminating between the time which is required for two or more classes of work, that to ordinary eyes may seem to be identical in value, is not easily acquired, unless there is a long period of concentration given to it alone. For that reason there is more likely to be perfect quantities when they are taken out by an independent surveyor than by the architect or whoever prepared the plans. In one case form or arrangement must be predominant, in the other cost rules. The architect cannot well devote himself to a consideration of the fractions of time which differentiate various sorts of work, while the surveyor should be able to make as close an approximation to the minutes, hours or days which will be needed as any builder. There cannot be too little guessing in preparing estimates for tenders, and without the amplest bills it is difficult to see how guessing is to be avoided. Moreover, owing to the facilities of communication, competitions for a contract are no longer confined to the district in which the work is to be carried out. In order that all of them may have fair play it is becoming yearly more necessary that uniformity in the bills should be insured. That end does not seem attainable if there is a rough-and-ready sort of grouping imposed on the competitors which they cannot all equally appreciate. Without exhaustiveness there cannot be such uniformity as is desirable. On this subject Mr. LEANING says:—"The adoption of a code of rules by the Manchester Society of Architects, which differs in many respects from the best London practice, is to be deplored, for though some differences are at present unavoidable (local customs being difficult to change), yet united action on the part of that and other societies would have resulted in the removal of some of the divergencies if they had thought it advisable, which it is presumed they did not. One recognised system of measurement throughout the kingdom should certainly be the object which the profession should strive to realise."

The liabilities of a surveyor are not to be encountered with a light heart. It is true, as Mr. LEANING says, "when a properly qualified surveyor prepares quantities, he makes remarkably few mistakes;" but, on the other hand, it is absurd to have quantities paid for, and yet to expect a builder to accept them entirely at his own risk. So inequitable an arrangement would be nullified if it were made to form part of the contract, as is desired by

\* Quantity Surveying for the Use of Surveyors, Architects, Engineers and Builders. By J. Leaning. Third edition revised and enlarged. London: E. & F. N. Spon.

quantity surveyors as well as builders. There is little doubt the more fair arrangement would have been generally adopted long ago if it were not for the Council of the Royal Institute of British Architects. The fear of offending the least of the members has upheld a practice which, to say the least of it, is more honoured in the breach than in the observance, and one, too, which leads to other evils. On the subject of responsibility, as well as on the procedure in London offices in relation to quantity taking, the student will find definite information in Mr. LEANING'S pages.

## ELECTRICAL INSTALLATIONS.

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Continued from last week.)

### MEASURING INSTRUMENTS.

**Ammeters and Voltmeters.**—There are several classes under which ammeters and voltmeters can be broadly placed, but those mostly used act either by electromagnetic, electrostatic, or heating effect.

It may perhaps be useful to briefly describe the principle upon which these instruments work and their defects.

**Electromagnetic.**—The most common of all instruments are the soft iron needle, which come under this heading, and it may perhaps be advisable to describe them fully.

The usual form consists of a circular coil, which constitutes the magnetic field; in this coil is a piece of soft iron of special shape which is connected to a nearly-balanced pointer and pivoted. The pivot centre does not, however, coincide with the axis of the coil, but it is nearer to one side. When a current is passed through the coil the iron is attracted to the side (of the coil). The shape of the iron determines the amount of attraction for, say, every ampere flowing through the coil. The iron is attracted because the tendency of every magnetic system is to become as short as possible, and the iron improves the circuit when it moves nearer the side of the coil. There are many types of this kind of instrument, some with unbalanced moving parts, and consequently a gravity control; others with the moving parts balanced and a spring control; but they may be all summed up as being rather inaccurate. The sources of error are numerous; the moving parts are heavy and must be suspended on pivots, consequently there is a considerable amount of friction and the needles are apt to stick. If the iron is not absolutely pure and soft it will retain its magnetism after the current is turned off. Suppose that it has an appreciable polarity such that it opposes the coil, it will then read low when the current in the coil is increasing, but it will read high when the current is diminishing; thus the readings will lag behind the current. These instruments are much affected by outside magnetism, as the magnetic circuit is very open, and are not really accurate enough for voltmeters, although they are often used for the purpose; but it will well repay the extra cost if a meter of the type about to be described is used, as unsteadiness in voltage increases the lamp renewals considerably. They are, however, very suitable for dynamo and other ammeters where 3 or 4 per cent. error is not of any consequence, as they are strong and capable of withstanding the rough usage they are subject to for such use.

The instruments under this heading also include the Weston (spring control) voltmeter, which is now gaining universal favour for dead beatness, sensitiveness and small current used. A permanent magnet is employed with a cylindrical air-gap, in which is a rectangular coil of wire wound on a silver or copper former working lightly on jewelled pivots. To produce a uniform field this coil encloses a soft iron cylinder. A fine hair-spring is fixed to each end of the coil, one serving to lead the current in and the other leading the current out of the coil. These springs form the control which is proportional to the angle of twist, and they also keep the coil central, taking the strain from the pivots; in fact, in the standard horizontal dial form of instrument the top pivot is used to take the thrust when the coil is shaken, the bottom pivot only being used, and the coil is kept vertical by the spring. Friction is thus reduced to a minimum. The forces, however, are very great, as the magnet may be made as strong as necessary, independent of the

number of turns on the coil, the only counter effect being to increase the weight; thus the instrument may be made extremely sensitive. There are many other forms of the same instrument, but none have met with such favour as the Weston, and this is almost entirely due to the great permanence of the magnet, and the perfect workmanship.

The defect which is common to all electromagnetic instruments is that electromagnets and currents outside the instruments affect the readings. In this last-described instrument, however, this defect is reduced to a minimum in consequence of the extremely powerful magnetic field and the small air-gaps in the circuit; and they are consequently suitable for main voltmeters.

**Hot-wire Instruments.**—The hot-wire type of instrument is considerably used, the best known, perhaps, being the Cardew and the Ayrton & Perry. The action in both instruments is due to expansion caused by the heating effect of the current, a wire being employed in the former and a twisted strip in the latter.

The Cardew instrument consists of a long length of wire running in small pulleys, one end being attached to the pointer and the other to an adjusting screw. This wire is encased in a long tube to keep off draught as much as possible, and it is usually placed horizontally to prevent continual movement of the pointer caused by variation in temperature. The tube is, however, sometimes placed vertically when the vibration of the pointer is not objectionable, as it is not so liable to stick as when horizontal. The Ayrton & Perry instrument consists of a flat strip fixed at the two ends and twisted in the middle (while very hot). The elongation of the strip, due to the heating, causes the middle point, to which is attached the pointer, to twist. This instrument is practically frictionless and more accurate than the Cardew.

The great objection to this type is that they are usually affected by draught, and they waste a considerable amount of energy. There should always be a standard instrument to check them if they are used as voltmeters for installations.

**Electrostatic.**—Electrostatic instruments are used largely for high voltages. They consume no current and are simple. They consist essentially of two sets of plates, one movable and the other fixed, so arranged that in trying to move together they must twist the movable ones round; in fact, the principle of this arrangement is very similar to that of the iron and coil already noted, if the inner surface of the coil is taken as one set of plates and the iron as the other. These voltmeters have lately been improved so greatly that they may be used on 100-volt circuits. The forces are, however, very small and the instruments delicate, but they are extremely good as standards in the hands of trained electrical engineers. I would not, however, recommend them for private plants, as the attendant is not often sufficiently skilful.

### METERS.

The action of supply meters may be also briefly described. There are two chief types used in this country—the motor and the clock meter. The motor meter is now the most used in houses taking current from a supply station; but for private installations, the fact that the clock meter must be wound up is not a disadvantage, and there are many points in favour of the latter.

**Motor.**—The motor meter consists essentially of a motor with a brake. The speed of the motor must be proportional to the energy passed through it. Fluid friction or Foucault currents form the brake, the former examples being the Ferranti and the Schallenger, the latter being the Hookham, the Thomson, and the Perry.

In the case where the torque is proportional to the current the brake mechanism must run at such a speed that the particular kind of brake used will give a retardation proportional to the speed; the motor will then run at a speed proportional to the current.

Those meters using Foucault currents run at a slower speed than those using fluid friction, because, although Foucault current friction is always proportional to the speed, they usually have mercury accumulators, etc., and consequently fluid friction as well, but this law is only strictly true of fluid friction at extremely low speeds. In the Ferranti meter the speed is high, and such that the friction is proportiona

to the square of the speed ; but as the torque in this meter is proportional to the square of the current, the speed is proportional to the current. Solid friction plays a more important part in high-speed than slow-speed meters, and owing to the uncertainty of solid friction, due to dust, &c., they are more liable to get out of order and run slow.

To prevent any misconception, it may be stated that a "high"-speed meter makes from two to three revolutions per second as a maximum, a slow-speed meter about one. At the speeds at which these motors run the back pressure is absolutely negligible, and consequently the ordinary laws of a motor do not apply. The torque is the only important factor, and the speed is regulated by an entirely different apparatus, the brake as described.

*Clock.*—Perhaps the most suitable form of meter for private installations is the clock meter, and that known as the Aron is the most used. In this form there are two clocks with pendulums, one of which has a coil of fine wire or shunt on it and swings above a series or main coil. As the pendulum swings over the coil the reaction between the series and shunt coils makes the clock go faster or slower, according to the way they are wound and the directions in which the current is flowing. A differential gear is placed between the two clocks, and this actuates the dials, which thus record the difference between the two, and this is proportional to the units passed through the coils.

#### SWITCHBOARDS.

The arrangement of a switchboard for a private plant will most probably be on the two-wire system, but it might be advisable for a mill, factory or large mansion to adopt the three-wire system when there is a large area to be covered and the length of wire used is considerable.

A two-wire installation should always be switched from one wire only, even if the two conductors are insulated, and the battery should be earthed at the other pole. The positive wire is the one that should be insulated, and the other earthed. The best way to earth a wire is to bury a copper plate in coke, rammed hard, with a wire brazed to the plate leading to the terminal. When this is done it will be perfectly safe to carry out all switching on the positive pole, and this saves the cost of half the fuses, switches, &c.

Every dynamo must have an ammeter, single-pole fuse and single-pole switch ; the accumulators should have a charge and discharge regulation switch, an ammeter and single-pole fuse ; the ammeter and fuse should, and in fact must be, on the negative end of the battery, as the current cannot be measured as it enters the regulation cells. An automatic switch should be placed between the dynamo and the accumulators, so that the circuit is made when the dynamos are at a slightly higher voltage than the accumulators, and the circuit broken when the dynamo pressure falls below this.

It is desirable that the main voltmeter should have a wide open scale near the normal voltage, and the pointer should be visible from the furthest part of the dynamo-room. A thick black mark on the dial or the glass front at the correct position will show at a glance whether the voltage is high or low.

The arrangement of the fuses, switches and instruments should be such that the use of everything can be seen at a glance, and it is advisable to keep all the instruments together on a separate slab for each dynamo. The accumulator instruments should also be kept together, as also the main ammeter switch and fuse. Spare fuses must also be kept for each fuse terminal, of the correct size.

The accumulator ammeter should have an evenly divided scale, the zero being in the middle. The instrument will then show at a glance whether the cells are charging or discharging, and with what current.

Two supply meters reading in Board of Trade units should be used, one connected to the dynamo circuit and the other to the main circuit. The efficiency of the plant can then be obtained immediately by dividing the reading on the main meter by that on the dynamo circuit ; also the amount supplied to the lamps can be seen and a check on the wasteful use of current can be made.

If the installation is far from any large town or place where standard meters are kept, it will be advisable to have a portable voltmeter of the best class, which can be checked

occasionally with a standard one, and then compared with the main voltmeter when desired. Ammeters can also be calibrated by a low-reading voltmeter if a standard resistance is used, and the fall of potential taken across this resistance.

To be really fireproof, no wood should be used in the construction of the board. Slate or marble slabs containing the instruments should be fitted and bolted to T iron vertical bars, kept together by horizontal iron stays. The board should be kept well away from the walls (at least 2 feet) and from the ceiling.

The walls, roof, floor, &c., near the switchboard should be of concrete, and rubber mats should be placed on the floor, to insulate the attendant. If these precautions are adopted, it may be certain that a fire originating at the switchboard will be practically impossible, and the switchboard will be the last place to be destroyed in case of fire. It is, however, generally recognised that a fireproof switchboard is of little use if it is surrounded by matchboarding or other inflammable material.

#### OUR ANCIENT CATHEDRALS.

THE first of a series of popular lectures on "Matters Connected with Building" was given on Wednesday, February 24, at Carpenters' Hall, by Professor T. Roger Smith, F.R.I.B.A.

In the unavoidable absence of Professor Aitchison, the chair was taken by Mr. Alfred Preston, a past-master of the Carpenters' Company.

Professor Roger Smith said :—It is a pleasure to deal with a subject of so great and so varied interest as that of "Our Ancient Cathedrals," or, in other words, cathedrals erected during the Middle Ages. Cathedrals are too numerous to be all included in a single lecture ; indeed, within such a limit it would not be possible to thoroughly exhaust the details of one.

A cathedral represented the dignity and greatness of its master the bishop, a prelate whose rank nowadays is little less than that of a prince, but whose power in Mediæval times was often greater than that of princes.

Cathedrals played an important part in the lives of our forefathers ; indeed, it is hard for us to realise what they were to the people who built them. At a time when there were no printed books, no newspapers, no steam-engines, no machinery, and no means of travelling, when there was scant comfort or beauty in the dwelling, these wonderful buildings, their architecture, shrines, tombs, mosaic and carving, were keenly criticised and appreciated.

Not only in England, but in every city in Europe similar buildings were being erected. Viollet-le-Duc bears testimony to the great number building at one time in France, including those of Paris, Rouen and Chartres. They were undoubtedly the greatest engineering works of their age, and when we consider how few the appliances, and how much less the available wealth in comparison to the present day, we are compelled to think their erection must have heavily taxed the people among whom they were built. Cathedrals were used for many purposes—for meetings, for the performance of miracle plays, but chiefly for religious services in an age when the hold of religion on the people was very strong.

When the year 1000 passed without any noticeable change, and there was no longer the expectation of a speedy ending of the world, a great revulsion of feeling took place. The same kind of religious ferment in men's minds which gave rise to the Crusades found an outlet in the building of cathedrals. We may compare it, in some small degree, to the desire of the present day that there may be a Board school in every village, or a public hall in every town.

In England the first impulse came from the Norman Conquest. For nearly two centuries Norman architecture dominated our cathedrals—a style massive, even heavy in character, the windows short in proportion and without tracery. In the end of the twelfth century there was a gradual transition to the style known as Early English, a style which became the most beautiful and the most graceful of English styles, and which attained its greatest perfection in the thirteenth century. Simple tracery was introduced in the windows, which were higher than in the previous style, and pointed arches were first used. The tracery developed through a series of circular patterns into more or less purely geometrical forms, until, at the beginning of the fourteenth century, these give place to the flowing curved lines which characterise the following style, that known as English Decorated. Then follows the style known as Perpendicular, sometimes termed with less accuracy Tudor. Here the curved lines of the tracery are changed for rectilinear lines, the mullions are carried up to the top, and horizontal transoms are introduced. In the Perpendicular style there is much dignity, combined with a certain degree of formality and

squareness. This style prevailed during the whole of the fifteenth and part of the sixteenth centuries.

Although thus divided into various styles, we have for a period of four centuries and a half gradual changes going on, the merging of one style into the other, the new style reaching its zenith and giving way in turn to the succeeding style. In the Norman work ornamentation is restricted to certain parts of the building; in the Early English the building is much more covered by architectural features, and heavy masses of intricate mouldings are skilfully used, giving that wonderful play of light and shade which so essentially distinguishes all Gothic architecture. Additions were constantly being made to these buildings by men who worked according to the taste of their own day and not according to the plan on which the buildings were begun. Buildings which we should think very good were pulled down to be rebuilt in the newer fashion, with as little hesitation as a lady would have in discarding an old-fashioned bonnet.

Few buildings were completed in any one style. The cathedrals tell the tale of their growth by the styles imprinted on them. Salisbury alone shows a uniform style throughout. This was because the bishop's chair was transplanted, and a new cathedral entirely rebuilt. At Old Sarum, the original site of the bishop's church, the same variety may have existed, but the monks and the soldiers could not agree at Old Sarum, and the monks made themselves a new home. Notwithstanding this diversity of treatment the result is very rarely inharmonious, thanks to the fine feeling for art of the men who did these works.

Norman naves were mostly covered by timbered roofs, but in all subsequent work vaulted stone roofs were constructed, many of which are of great beauty. To support these roofs the outside walls were fortified by buttresses. These were either built against the walls or in the form of piers at some distance from the walls and connected to the walls by a bridging arch. These latter were termed flying buttresses. A system of thrust and counter-thrust is peculiar to Gothic architecture, and the study of the means by which equilibrium was secured is one of great interest.

Generally the whole tendency of the main lines is upward, and for this purpose towers or spires were always intended, though not always built.

The lecturer, with the aid of a fine series of views of English cathedrals, then pointed out the distinguishing features peculiar to each. Durham Cathedral, with its splendid towers and fine situation, the interior with the massive stone Norman piers cut up into shafts, or variously scored with spiral or zigzag lines, the whole a good example of the Middle Norman period. The Galilee is of later date, with more slender columns and more ornate treatment. Carlisle Cathedral has been more than once devastated by fire, but the remaining east end shows one of the finest windows of fourteenth-century work. York Minster displays great size and dignity, but much of the interior vaulting is a fairly good restoration done early in this century after the partial destruction of the old work by fire. Lincoln is claimed by many as the finest of all our cathedrals; if not the finest, it certainly has few to surpass it. The three towers are nearly in one style, and originally were all surmounted by spires. Two were destroyed by lightning, and the third was removed to prevent its meeting a similar fate. The interior shows a beautiful example of the triple division into great arcade, triforium and clerestory, while the choir justly enjoys a high reputation; and the Early English tracery in the east window is very fine. Lichfield is specially distinguished for its spires. Compared with spires towers appear low, but towers are unquestionably fine features. The west front with its numerous niches and figures has a very rich effect. Lichfield has an apsidal choir but no triforium. The west front of Peterborough is unique, as offering the only English example we can present in comparison with the very elaborate doorways common on the Continent. Anyone practically acquainted with building can have no reasonable doubt that the best method is being adopted for its preservation. The Norman interior has a fine painted ceiling. The remnant of Norman work in the beautiful doorway on the south side of Ely Cathedral was compared with the Early English doorway on the west front of the same building, where are also two windows inserted at a later date—one being a good example of Decorated and the other of Perpendicular work. The central octagon at Ely, constructed by Alan de Walsingham, is a unique feature and one of great beauty. The arcading of the lady chapel in a white stone almost like alabaster has a pleasing effect.

Norwich Cathedral, with its central tower and spire, strikes the eye agreeably, the long lines of the roofs leading up to the great central mass very successfully. The interior arcading is a good example of Norman work, the vaulting being of later date. Probably there was originally a painted ceiling as at Peterborough. Westminster has a perfectly unrivalled interior, the apsidal east end, the great beauty of the triforium, and the elegant diaper-work on the wall spaces in the spandrels adding

refinement and delicacy to the whole. Sir Christopher Wren found the spire of Salisbury Cathedral to be 2 feet out of the perpendicular, and the mark he made has been preserved. More recent examinations show that it has not gone over any farther.

Concluding with a series of views of Canterbury Cathedral, in one of which the amount of plain wall space and the thin pilasters at the angles of the Norman transept was strikingly contrasted with the more decorated wall and heavy angle buttresses of Perpendicular work, the lecturer was greeted by a large and appreciative audience with much applause.

Mr. Preston, in moving a vote of thanks (which was enthusiastically given), said, "We must all earnestly desire that these ancient works shall be preserved in their integrity, so that we may long have the opportunity of admiring and recognising the ability of our forefathers in their construction."

## THE LATE H. MACALLUM.

A MEMORIAL of the late Mr. Hamilton Macallum in the form of a monument of Portland stone and a bust by Mr. Onslow Ford, R.A., was unveiled at Beer, South Devon, last Saturday. The memorial was subscribed for by the friends and brother artists of Mr. Macallum, and Beer was selected as its site because it was his chief resort for many years, and he died there last June. The memorial was unveiled by Professor Herkomer, R.A., in the presence of Mr. Macwhirter, R.A., Mr. Onslow Ford, R.A., and Mr. Colin Hunter, A.R.A. Wreaths were placed on the memorial by Mrs. Macallum, the memorial committee and others. Professor Herkomer spoke of the immortality of art, and said that no painter of eminence who had a thought to convey to his fellow-creatures through his art could die in the common sense of the word. The man was often irreconcilable with the artist, and the artist, more than most workers lived a dual life, but the work of Hamilton Macallum was as welcome to the art world as his manly character was to his friends. The greatest art had no worm-wood, and they were grateful to the painter who painted the effects of nature in her joyous moods. As men and women passed by that beautiful monument they would reflect upon the reason why it stood there facing the sea, and when they knew would look at the sea with the eye of the painter whose life was symbolised in that monument. Mr. Macwhirter and Mr. Onslow Ford also spoke. It should be stated that the monument, in addition to the bust which faces the sea, has upon one side a barometer, which it is thought will be of service to the fishing community of the place.

## GREEK MONUMENTS AND GREEK HISTORY.

THE first of a course of three lectures was delivered on the 4th inst. by Professor Percy Gardner, at the Royal Institution, on "Greek History and Extant Monuments." It was to some extent introductory, and dealt with the relation of the monuments to Greek history. In his succeeding lectures he will deal with the Athenian Acropolis as a background of history, both before and after the Persian wars. At the commencement of his lecture Professor Gardner dwelt on the terms "antiquary" and "archæologist." Formerly these terms were applied to fossilised students of the type of Mr. Oldbuck, familiar, of course, to all who have read "The Antiquary." The modern archæologist was nothing if not progressive and up to date. Like the man of science he rejected the textbook of a few years back, and was constantly revising his theories as new facts were brought to light. The idea of evolution was, he said, a corrective of scepticism, and a further check was to be found in archæological research, which appealed to existing fact in prehistoric archæology, in that of Egypt, of Greece and of modern times. In the case of Greece we had an abundant literature to compare with the results of excavation of the contents of museums, and in comparison with what we knew of Ancient Greece from the histories of Polybius and Herodotus modern excavation could add little to the existing stock of our information. All it could do was to fill up the background, and to help to realise more vividly the literature and art of Ancient Hellas, her poets and orators. The lecturer referred to the large part played in Greece by the imitative arts. We in this country expressed our emotions rather in poetry and music than in the plastic arts. With us sculpture as a mode of expressing thoughts, feelings and emotions did not exist. With the Greeks it was different. They expressed in painting and sculpture their strongest emotions. They thought and felt in stone and marble. We never dreamed of expressing our emotions after a great battle in sculpture, and yet to the Greeks this was the most natural thing in the world. Professor Gardner then proceeded to enumerate some of the results of museum work in the field of numismatics and of painting, referring to the recovery of the style of Polygnotus. He also dwelt on the services

rendered to classical archæology by those highly-trained scholars who did not actually excavate themselves, but who extracted from the raw materials the grains of gold that were really of importance. The recent excavations at Delphi were then dealt with, and slides illustrating these were thrown on the screen. A few years ago Delphi was hidden by squalid buildings, but now the French archæologists had succeeded in laying the site of the ancient town bare. The situation of Delphi and its surroundings were shown, and views were also shown of the Castalian springs, the trophies of Marathon and Ægospotami, the treasures of Sicyon, Siphnos and Athens, &c.

## TESSERÆ.

### Heraldic Mottoes.

THE origin of heraldic mottoes might probably be traced to two sources, in themselves diametrically opposed to each other—religion and war. "Extremes," we are told, "sometimes meet," and certainly these two feelings did coalesce in the institutions of chivalry, if we may be allowed to prostitute the holy name of religion by identifying it with the frenzy which possessed the human mind in such enterprises as the Crusades. It is uncertain whether we ought to deduce the origin of mottoes from those devout ejaculations, such as "Drede God!"—"Jesu mercy—Lady helpe," which occur on ancient tombs, or from the word of onset, employed by generals on the battle-field to stimulate their soldiers to great feats of prowess. The preponderance in point or number of religious mottoes would incline us to the former supposition; but the general opinion of our best authors favours a military origin. The war-cry known in Latin as the "clamor militaris," in French as the "cri de guerre" and in the Scottish language as the "slughorn" or "slogan," is of very remote antiquity. In early scripture history we have an example in "The sword of the Lord and of Gideon," the word of onset employed by the Hebrews against the Midianites in the Valley of Jezreel. Among barbarous nations at the present day it has its representative in the war-whoop, or yell, employed as well to animate the courage of their own party as to inspire terror in the hearts of their enemies. From an early period the phrase "a boo" was employed by the Irish for these purposes.

### Sculpture and Painting.

Those arts which represent by the organic natural forms derived from life are essentially imitative, and depend on the artistic study of nature as only the actual, organic, natural form stands in that necessary and intimate connection with spiritual life, possesses that universal significance from which art takes its rise. But the artist is capable of attaining a conception of the organic form which shall stand above individual experience and find therein the fundamental form of the most exalted ideas. Now these arts are distinguished from one another in this, that the one, sculpture or the plastic art, places bodily before us the organic forms themselves, only that the difference of material often makes change of form necessary in order to attain a similar impression, and that the other, design or the graphic art, merely produces by means of light and shade the appearance of bodies on a surface, inasmuch as the eye only perceives corporeal forms by means of light and shade. Colour, so far as regards possibility, can indeed be combined with both arts, but in sculpture it operates with so much the less advantage the more it tries to approach nature, because in this endeavour to represent the body completely the want of life only strikes us the more disagreeably. On the other hand, it enters quite naturally into combination with design which in itself represents more imperfectly, and does not represent bodies, but merely the effects of light upon them, to which colour itself belongs, and elevates design to the art of painting. Colour, in its nature, effects and laws, has a great resemblance to sound. The relation of sculpture and painting, as regards their capabilities and destination, is already hereby defined in its main features. The plastic art represents the organic form in its highest perfection, and justly holds by its apex, the form of man. It must always represent completely and roundly, and leave nothing undefined—a certain restrictedness in its subjects, but on the other hand great clearness belongs to its character. Painting which immediately represents light, in whose wonders it rightly shows its greatness, and in exchange is satisfied with the appearance thereby produced in the corporeal form, is capable of drawing much more into its sphere and making all nature a representation of ideas; it is more suggestive, but does not designate so distinctly. The plastic art is in its nature more directed to the quiescent, the fixed; painting, more to the transient; the latter can also, in that it combines far and near, admit of more movement than the former. Sculpture is therefore better adapted for the representation of character, painting for expression. Sculpture is always bound to a strict regularity, to a simple law of beauty; painting may venture on a greater apparent disturbance in detail, because it has richer means of again neutralising it in the whole.

### James Gillray.

Gillray, the caricaturist, like his great predecessor Hogarth, was apprenticed to a writing engraver, and acquired the use of the graving tool under the celebrated Ashby, who then resided at the bottom of Holborn Hill. Many a choice specimen of penmanship was copied by young Gillray in sweeping flourishes on the copper from the incomparable pen of Tomkins, of Sermon Lane. This was used to say that "the early part of his life might be compared to the spider's, busied in spinning of lines." Like Hogarth, too, whilst occupied in this mechanical drudgery, the incipient original artist was discoverable in certain humorous scraps which he sketched on the borders of the examples of round hand and text. Quitting the bench of Ashby, he became a pupil of Bartolozzi, and here his eccentric humour displayed itself, for during his studies in that school of super-Italian softness and elegance, verging on beautiful insipidity, did he display the rudiments of that daring species of dramatic design, that extraordinary graphic hyperbole, which almost met in its highest flights the outposts of the creations of Michel Angelo. It was not likely that such an original would be content to sit year after year over a sheet of copper perpetuating the renown of others, whilst with a restless and ardent mind bent upon exploring unknown regions of taste with the bill of genius in his vigorous grasp he could open a way through the wilderness of art, and by a short and eccentric cut reach the Temple of Fame. He set to work, and this labour he achieved to the astonishment of the goddess, who one day beheld this new wild votary unceremoniously scampering up the steps to her altar. The inventive faculties of such a mind as his—its aptitude to seize upon the most prominent features of passing events; the exhaustless fecundity of thought that occupied the remotest corner of his crowded compositions; his comprehensive knowledge of the human visage, its passions and expression; his original perceptions of physiognomy as exhibited in a never-ending variety of masks, so easily likened to all and copied individually from none; his characters, like Shakespeare's, though creations of his own brain, yet fitting and consistent in form, action and attributes—all those faculties surprise the more, centering as they did in such a man, one of his slouching gait and careless habits, who with all his capacity for creation and power of execution, with such apparent energy of thought and deep reading in the living book of human action, appeared scarcely to think at all, and to care no more for the actors in the mighty drama which he depicted, nor for the events which he so wonderfully dramatised, than if he had no participation in the good or evil of his day. Gillray was one of those unaffected wights who accomplished what he undertook without scientific parade, and even without the appearance of rule or preconcerted plan. His best designs were off-hand compositions, and although he knew that these effusions of his graphic skill were superior to those of his compeers, he was so little wrapt in his own conceit that he supposed another might do as well as himself if he tried. He used to smoke his pipe with his early employers, and would exert his faculties more to win a bowl of punch than to gain ten pounds. Holland, a print-seller in Drury Lane, was one of his first encouragers. Collectors are aware of a plate etched by Gillray for Holland dated 1779. The subject is discreditable to the taste of the publisher and the artist. In this early work, however, it is discoverable that he benefited by his sojournment with Bartolozzi; there is a freedom united with a graceful execution of the needle that proves he had worked in the school of a master. The drawing, too, is marked with character and spirit. The early political caricatures of his prolific hand were generally directed against the Government party. These he was hired to do, usually at a small price, stipulated according to the will of his employers. The acquirement of wealth, however, it seems, on the authority of those who knew him most intimately, was the least object of his consideration. Many stories related of him, too well authenticated to leave a doubt of the facts, declare him to have been a stranger to the feelings of friendship, and sometimes meanly mischievous in his contracted circle.

### Blondel's Theory of Architecture.

The use for which an edifice is intended almost always gives the architect an idea of its extent and the number of its parts, provided he have common sense to distinguish what in each case is suitable to the time, place, or persons. To him is entrusted the distribution of the parts, and the plan of the whole. In this he must be directed by certain principles, lest he should form a wrong judgment of beauty. He must also be experienced, that he may know how to apply this powerful auxiliary in all cases, its fundamental rules being by no means determined. The theory of architecture performs this; it gives two sorts of rules, some necessary, which are indispensable to observe, without committing the most offensive and revolting errors; others accessory, which may be omitted without rendering the work defective, but must prevent its being beautiful. The rules of the first kind, and which theory must determine, are reduced to justness, regularity, order and symmetry.

remove these attributes, and the work is incorrect. But it is not sufficient that a work be without defects, it should also be beautiful, and to be so there must be an exact union of the pluralities with the unities; and this depends on the variety of the parts and the number and justness of the proportions. Theory, then, teaches the manner of disposing the whole of an edifice and combining a number of parts so as to produce correct harmony and beautiful proportion. Some are scrupulous in making the metopes square and equally high with the triglyphs, and yet this is not essential; but they will not scruple to cut the pediment and put it where it should not be; this is against the necessary rules, founded on the nature of construction. The accessory, or accidental rules, are the result of *à coup d'œil* and of sentiment, to which no precise limits can be assigned. The Greeks having this precision of sight, their proportions please and their ornaments are graceful; but no one can affirm that these are unalterable, and that they may not be superseded by others still more agreeable. The necessary rules must be rigorously observed, without attempting to alter them; the accidental ones may be taken from the best monuments, and from Vitruvius, but some liberty may be allowed.

#### A Set Scene by Inigo Jones.

First for the scene (according to Ben Jonson) was drawn a *landschap*, consisting of small woods, and here and there a void place filled with huntings, which falling, an artificial sea was seen to shoot forth, as if it flowed to the land, raised with waves which seemed to move, and in some places the billows to break, as imitating that orderly disorder which is common in nature. In front of this sea were placed six tritons, in moving and sprightly actions, their upper parts human save that their hairs were blue, as partaking of the sea-colour, their desinent parts fish, mounted above their heads, and all varied in disposition. From their backs were borne out certain light pieces of taffeta, as if carried by the wind, and their music made out of wreathed shells. Behind these a pair of sea-maids, for song, were as conspicuously seated, between which two great sea-horses, as big as the life, put forth themselves, the one mounting aloft and writhing his head from the other, which seemed to sink forward; so intended for variation and that the figure behind might come off better; upon their backs Oceanus and Niger were advanced. The masquers were placed in a great concave shell, like mother of pearl, curiously made to move on those waters and rise with the billow; the top thereof was stuck with a chevron of lights which, indented to the proportion of the shell, struck a glorious beam upon them as they were seated one above another, so that they were all seen but in an extravagant disorder. On sides of the shell did swim six huge sea-monsters, varied in their shapes and dispositions, bearing on their backs the twelve torch-bearers, who were planted there in several graces. These thus presented, the scene behind seemed a vast sea, and united with this that flowed forth, from the termination or horizon of which (being the level of the state which was placed in the upper part of the hall) was drawn by the lines of perspective, the whole work shooting downwards from the eye, which decorum made it more conspicuous and caught the eye afar off with a wandering beauty, to which was added an obscure and cloudy night piece that made the whole set off. So much for the bodily part, which was of Master Inigo Jones's design and act.

#### Rubens, Correggio and Claude.

The genius of Rubens was strongly turned to the picturesque disposition of his figures, so as often to sacrifice every other consideration to the intricacy, contrast and striking variations of their forms and groups. Such a disposition of objects seems to call for something similar in the management of the light and shade, and accordingly we owe some of the most striking examples of both to his fertile invention. In point of brilliancy, of extreme splendour of light, no pictures can stand in competition with those of Rubens; sometimes those lights are almost unmingled with shade, at other times they burst from dark shadows, they glance on the different parts of the picture and produce that flicker (as it sometimes is called) so captivating to the eye under his management, but so apt to offend it when attempted by inferior artists or by those who are less thoroughly masters of the principles of harmony than that great painter. All these dazzling effects are heightened by the spirited management of his pencil, by those sharp, animated touches which give life and energy to every object. Correggio's principal attention in point of form was directed to flow of outline and gradual variation; of this he never entirely lost sight even in his most capricious foreshortenings, and the style of his light and shadow was so congenial that the one seems the natural consequence of the other. His pictures are always cited as the most perfect models of those soft and insensible transitions of that union and effect which above everything else impresses the general idea of beauty. The manner of his pencilling is exactly of a piece with the rest, all seems melted together, but with so nice a judgment as to avoid by means of certain free, yet delicate touches, that laboured hardness and insipidity which arise from what is called high finishing.

Correggio's pictures are indeed as far removed from monotony as from glare; he seems to have felt beyond all others the exact degree of brilliancy which accords with the softness of beauty, and to have been with regard to figures what Claude was in landscape. The pictures of Claude are brilliant in a high degree, but that brilliancy is so diffused over the whole of them, so happily balanced, so mellowed and subdued by the almost visible atmosphere which pervades every part and unites all together, that nothing in particular catches the eye; the whole is splendour, the whole is repose, everything lighted up, everything in sweetest harmony. Rubens differs as strongly from Claude as he does from Correggio; his landscapes are full of the peculiarities and picturesque accidents in nature; of striking contrasts in form, colour and light and shadow; sunbeams bursting through a small opening in a dark wood—a rainbow against a stormy sky—effects of thunder and lightning—torrents rolling down, trees torn up by the roots and the dead bodies of men and animals are among the sublime and picturesque circumstances exhibited by his daring pencil. These sudden gleams, these cataclysms of light, these bold oppositions of clouds and darkness which he has so nobly introduced, would destroy all the beauty and elegance of Claude; on the other hand, the mild and equal sunshine of that charming painter would as ill accord with the twisted and singular forms and the bold and animated variety of the landscapes of Rubens.

#### Drawings by Great Masters.

The drawings of the great masters have a peculiar charm. By them, more than by works of any other kind, you are introduced into the secret laboratory of art, so that you may follow a painting from the first germs, through its various stages and changes, till it attains its perfect form. Von Rumohr, with his usual refined sense of art, directs attention to the sure mechanical taste with which these old masters always employed, in their drawings, the material which was best adapted to the object they had in view. If they wanted to sketch upon the paper a first thought just as it arose in the fancy, they usually chose the red Italian chalk, with which sketching is so easy, or the soft Italian black chalk. The breadth and softness of the strokes immediately give to such a first sketch something picturesque and massy; and, at the same time, the material allowed of further finishing, in a high degree, if it were desired. But if they wished to arrest a rapidly passing effect in nature, as it was fresh in their fancy, to seize an accidental, happy, quickly changing cast of drapery, or to mark sharply and distinctly the main features of some character, they preferred the pen, which allowed them to unite the easy flowing line with the sure and distinct indication of the form. If they desired in the portrait, in a study, in the composition, to express the most delicate movement of the form, the fine play of the surfaces lying within the outlines, they generally took a rounded silver pencil. On paper covered with a mixture of white lead and pale yellow ochre, verdigris, or some red, such a pencil marks but lightly and softly, and therefore allows of changing and improving *ad infinitum*, and by leaning harder, at length to mark decidedly among all the others the design in favour of which the artist has determined. If they wished to decide on the main distribution of light and shade, the full camel's-hair pencil dipped in sepia or Indian ink, with its elastic point, its bold fulness, led the most rapidly and surely to their object. In such drawings the outlines or the forms are often not marked, but result only from the limits of the shadows; when it was required at the same time to mark the form, the use of the pen was added. Lastly, for a more detailed marking of light and shade, coloured paper afforded them a middle tint, by the help of which they produced, with black chalk in the shadows and white in the lights, a very delicate gradation and a great relief of the parts. On account of these many advantages this mode of drawing has been very commonly used. It is not till after having seen from a great number of such drawings in how many sides a picture has been conscientiously prepared that we can understand the great perfection and extraordinary composition of so many pictures of the times of Raphael; and it is not till we have learnt to consider such pictures as the final result of a long series of studies of the most highly gifted minds that we are penetrated with a due sense of their great value.

#### The Original Drury Lane Theatre.

The King's Theatre (the stage on which Nell Gwyn performed), or "The Theatre" as it was commonly called, stood in Drury Lane, on the site of the present building, and was the first theatre, as the present is the fourth erected on the site. It was small, with few pretensions to architectural beauty, and was first opened on April 8, 1663, when Nell was a girl of thirteen. The chief entrance was in Little Russell Street, not as now in Catherine Street. The stage was lighted with wax candles on brass censers or cressets. The pit lay open to the weather for the sake of light, but was subsequently covered in with a glazed cupola which, however, only imperfectly protected the audience, so that in stormy weather the house was thrown into disorder and the people in the pit were fain to rise.

## NOTES AND COMMENTS.

THE Massachusetts State Legislature at the end of the present session should possess a tolerably complete knowledge of building. Among the Bills presented is one which proposes to limit the height of buildings in Boston to 80 feet, public buildings, churches, grain elevators and factory chimneys being exceptions. Another Bill will authorise the use of concrete for every purpose in building construction, provided the ingredients have been tested by the American Society of Civil Engineers. By a third Bill fireproof stairs must have at least one opening of an area of 5 square feet through the exterior wall on each storey. There is also a very remarkable Bill by which absolute power would be conferred on the head of the Building Department, for he can reorganise it without referring to civil service or other law. Desperate diseases require desperate remedies, and we suppose Boston must be in a bad official condition, or is the old tyrannic Puritan spirit again coming into fashion? A Bill for the regulation of stables might be copied and introduced in England with advantage. It prescribes that before permission is sought for the erection of stables, advertisements must be inserted in the newspapers and notices served on the owners and occupants of premises abutting on the proposed buildings. Plumbers have to be registered annually in Boston, but the arrangement is not found to be advantageous, and one of the Bills is intended to relieve plumbers from the obligation. A hint appears to be taken from the London Building Act, for there is a Bill to prohibit the erection of bay windows and oriel windows over any public road or square. There are some other Bills for the regulation of buildings which we need not mention. The series suggests that a great many authorities are concerned in the control of such work, and that "omnibus Bills" appear to be unknown in Massachusetts.

WHENEVER there is a recognised custom in a trade it should not be readily set aside in a law court. What is the basis of the common law of England but custom? A man may plead his ignorance of trade customs, but if SELDEN'S maxim, "Ignorance of the law excuseth no man," be acceptable, why should not a similar principle be applicable to the local laws of a trade? His Honour Judge PERRY, in the Manchester County Court, did not show that respect for custom that is desirable. The plaintiffs, who are timber merchants, claimed 4*l.* 12*s.* 6*d.* for sawing poplar trees into boards, which they had undertaken at 4*s.* 6*d.* per 100 superficial feet. According to the custom of the trade in Manchester and other towns, the centre cut of the tree was taken in making the measurement. The defendant said that, although he was to some extent in the trade, he was not aware of the custom referred to, and he contended that the plaintiffs were bound by their estimate and could not, by reason of a custom of which he knew nothing, charge him 4*s.* 6*d.* for 85 superficial feet instead of for 100 superficial feet. The Judge said that if the transaction had been between two timber merchants who knew all about the custom of the trade it might have been different, but under the circumstances stated the custom could not be read into the contract. He gave judgment for the plaintiffs for 4*l.* 0*s.* 9*d.* The plaintiffs, in view of the judgment having gone against them on the only point in dispute, said they would not ask for costs. The difference between the two amounts is not large, but as a principle is involved the case is important. Why should it be supposed a knowledge of the custom of the timber trade is to be restricted to timber merchants? If the transactions were limited to those between merchants that would be reasonable, but as business is rarely done with men who use timber, we cannot understand why there should be one set of rules for dealers and another for builders.

MR. J. ROMILLY ALLEN, the editor of the *Reliquary* and other publications, has just rendered another important service to prehistoric archaeology. The Society of Antiquaries of Scotland possesses a fund given by Dr. R. H. GUNNING, and by means of it Mr. ROMILLY ALLEN has been able to visit the various localities in the district south of the Esk, and to make arrangements for the photo-

graphing of a series of the most characteristic examples of sculptured stones for reproduction as illustrations to the forthcoming work on the "Early Christian Monuments of Scotland," which will shortly be issued by the Society. He has prepared a report on the condition of the more important monuments in the counties of Forfar and Perth, and also in some of the more prominent localities where efforts had been made for the better preservation of the groups of monuments, as at St. Andrews, Meigle and Govan. In some cases portions of the sculptured faces of the stones had been disclosed to view which had not been seen before, and are therefore absent in previous illustrations. Thus through the liberality of Dr. GUNNING the Society has now acquired a very valuable series of negatives and reproductions of typical examples of the early sculptured stones of Scotland. In his report Mr. ROMILLY ALLEN has urged the desirability of forming a complete collection of permanent prints and negatives, not only of these early sculptured stones, but of other classes of antiquities.

THE ingenuity of French legislators appears to be exercised of late years in devising new taxes. To obtain additional sources of supply would be an advantage in a country which has to meet so many demands on the public purse. But apparently what seems to inspire the search is not so much the expected addition to the national wealth as a desire to put as many people as possible to inconvenience, in order to exemplify the principle of equality. The most recent fiscal proposition is to levy a tax on painters. Why, it is asked, should they be exempted when so many classes of Frenchmen have to pay special taxes in order to be allowed to work? They are supposed to make large incomes in an easy way, and as, unlike most citizens, the principal part of their training was obtained from schools which are upheld by means of taxation, it is only justice that they should make a more liberal return in the shape of contributions to the state than ordinary citizens. There is a great difference between proposing taxation and making it compulsory. There may be no immediate impost levied on painters, but they are not confident of escaping in the future. Some painters believe licensing would have its advantages, if by its means the incompetent men could be eliminated, but that suggests the freedom from taxation which artists have hitherto enjoyed. A tax-collector who is paid a percentage on the money he brings in would not object to the contributions of the humblest amateurs, and would be disposed to place them on a footing with academicians.

THE last survivor of the band of reformers who formed FOURIER'S Phalanstère has passed away by the death of M. MORLON, a civil engineer, who died a few days since at Nevers in his eighty-sixth year. The history of the experiment must henceforth be a tradition depending on books. It is not generally known how much a question of building determined the fate of the proposed reform. COULOMB GENGEMBRE, whose name is now forgotten even among Socialists, was the man who gave reality to it. FOURIER was one among several theorists who believed the world was out of joint and concluded it was their mission to set it right. He, however, was assured he was gifted with an insight of the secret operations of nature, and what he has said about her quaternions, attraction of existences, polarity, distribution of series in harmonies, &c., is very strange. To him all things, including comets, were alive. He had, too, a notion of development, for he arranged the history of the world in periods, although neither DARWIN nor SPENCER would probably approve of them. The world he believed was not a living but a loving thing, always growing. He followed out his notions to what he believed was their logical conclusion, which was that a common life was the best means of securing the happiness of men, in which everyone would be "producteur, consommateur et associé." GENGEMBRE gave form to the conclusion by designing phalanstères, or big buildings in which eighteen hundred people could work and enjoy life in a sober way. But the excellence of the planning was fatal to Fourierism. The Phalanstère was considered to be worse than a prison, and people soon ceased to be ambitious to become developed as "un arbre passionnel en douze rameaux" in such a conservatory.

The Architect, Mar. 12<sup>th</sup> 1897

WINCHESTER CATHEDRAL.—SOUTH AISLE, LOOKING EAST.

CHURCH OF ST. MARTIN, LISKEARD, CORNWALL.—SECOND  
PREMIATED DESIGN.

BUSINESS PREMISES, HESSLE ROAD, HULL.

THESE branch premises are now in course of erection at the corner of Cottman Street and Hessel Road, and comprise large shop and ladies' room on ground floor, with commodious stock-rooms and manager's residence on upper floors. The buildings, which are being carried out by Messrs. HOCKNEY & LIGGINS, builders, of Hull, will be faced with red Ruabon bricks, with dressings of Ancaster and Howley Park stones, with a base, 5 feet high, of Swedish red granite, and roofed with Westmoreland green slates. The turret will be covered with red Ruabon tiles and copper dome. The whole of the inside floors will be fireproof. The inside fittings will be in pitch-pine and the shop fronts in polished oak. Messrs. GELDER & KITCHEN, of Hull, are the architects.

BUSINESS PREMISES, HOLDERNESS ROAD, HULL. =

THESE branch premises, which have been recently opened, are built in Lincolnshire red stocks and Howley Park stone, and covered with Welsh slates. The inside fittings are in pitch-pine, stained and varnished. The shop front is executed in polished oak and glazed with leaded lights above the transoms. The work has been carried out by Messrs. HOCKNEY & LIGGINS, builders, under the supervision of Mr. W. A. GELDER, architect, Hull.

## WINCHESTER CATHEDRAL.—III.

THE successor of FOX was THOMAS WOLSEY. He wanted money, and to gain it set aside all scruples about the number of mitres which might appear on his banners, and were suggestive of neglected duties. LINGARD says of him:—"As chancellor and legate he derived considerable emoluments from the courts in which he presided. He was also Archbishop of York; he farmed the revenues of Hereford and Worcester, sees which had been granted to foreigners; he held in *commendam* the abbey of St. Albans, with the bishopric of Bath; and afterwards, as they became vacant, he exchanged Bath for the rich bishopric of Durham, and Durham for the administration of the still richer church of Winchester. To these sources of wealth should be added the presents and pensions which he received from foreign princes." WOLSEY was as ardent a lover of building as any churchman. The presentation of Hampton Court to HENRY VIII., his college at Ipswich, and the foundation of Christ Church, Oxford, those "twins of learning," testify to his munificence. But it is doubtful whether he was ever seated in Winchester Cathedral, and during his two years of tenure he did not attempt to improve the building. STEPHEN GARDINER came next. He might claim to be one of the bishops to whom the cathedral was most indebted, for by his tact and his relationship to the TUDORS he was able to preserve it from injury during the reigns of HENRY VIII. and EDWARD VI. The bishopric was shorn of some of its estates in HENRY's time, and there were changes in the order of services during EDWARD's short reign, but when Queen MARY was married to PHILIP of Spain by GARDINER, the cathedral presented nearly the same appearance as when FOX ruled in it.

But a change was looming. The succession of ELIZABETH caused no rejoicing at Winchester. The first bishop appointed by the Queen, ROBERT HORNE, while disposed to be kindly towards the Catholics, was enraged by the sight of every symbol of their belief. All the statues were torn from their places by his orders. To his mind the chapter-house and cloisters were also associated with false doctrine, and were cleared away, like the images. The dean's garden occupies the site of the chapter-house, and his residence is formed out of the prior's hall. We may form a notion of the violent spirit which inspired sixteenth-century iconoclasm from observations which were made 270

years afterwards. A correspondent of the *Gentleman's Magazine*, writing in 1833, says:—

The pavement of the chapel immediately behind the high altar having been lately removed and lowered, it was found to have been almost entirely composed of relics of figures, niches and other fine carvings, all painted and gilt. Many of the heads are as large as life; they are very numerous, in perfect preservation, and exhibit sculpture more beautiful than that of the figures remaining in this or any other church could have led us to expect. Several of them appear to have been monumental, but the majority were doubtless once enshrined in the altar or chapel-screens. From figures reduced to mere wrecks, in many instances even less entire than these, which were first hurled to the ground, then dismembered, and afterwards buried in the earth, we are obliged to deduce our conclusions of the skill and ability with which sculpture was at different times performed.

JAMES I. resided for a time in Winchester, but he cannot be charged with any depredations in the cathedral. The city was then beginning to feel more acutely the privations which arose from a change in the old order of government. The length of the cathedral was a temptation to indecorum, and the western part served as a sort of public thoroughfare between the parts of the city on the northern and southern sides. The services were carried out with negligence. Winchester was, therefore, one of the cathedrals which called for interference during LAUD's archiepiscopate. CHARLES I. was also a man of taste, and it is not unlikely that he aided in efforts to restore the building. That money was somehow expended is evident from the account of a visit to various cathedrals by three gentlemen from Norwich in 1634. They describe the "brave old mother cathedral, fair and long, with St. GEORGE on horseback on the top of her flat-bottomed steeple," suggesting the prelacy of the Order of the Garter held by the bishop. The roof of the choir is said to be "stately, fair and rich," and it is added that "to beautify the same a great sum of money hath been very lately bestowed." There is reference to stained-glass windows which represented the genealogy of JESSE, the history of the Nativity, and the Revelations. All the precious stuffs of pre-Reformation times were not converted to secular uses, for the travellers mention "many rich hangings and cloths, one of velvet wrought with gold for the high altar, which was given by Bishop FOX; others of cloth of tissue and cloth of gold filled with pearl wire, and a rich and fair canopy of cloth of gold to carry over the king." There was no city in England in which loyalty to the sovereign was more innate than in Winchester, and CHARLES I. and his advisers were aware they could count on it.

In the early part of the Civil War Winchester was therefore a refuge for the cavaliers. It was attacked in 1642 by the Parliamentarians under "that valiant soldier and patriot of his country," Sir WILLIAM WALLER, and captured. The citizens were compelled to pay 1,000*l.* The troops were not, however, to be restrained from attacking ecclesiastical work by any fine, and there is no doubt they entered the cathedral and performed some mischievous acts there. But to what extent cannot be ascertained. One of the officers, Colonel FIENNES, a son of Lord SAYE AND SELE, who as a scholar of Winchester College was indebted to WILLIAM OF WYKEHAM, was able to preserve the bishop's chantry, and probably was no less successful in other parts of the building. The brave officer was not sufficiently rewarded by fate for exhibiting so much gratitude. He failed to keep Bristol from Prince RUPERT, and PRYNNE proposed that he should be tried by court-martial, and if possible shot. Afterwards, when keeper of the Great Seal, and about nine months before CROMWELL's death, he was selected to explain the Protector's views at a time when a Spanish invasion and other troubles were impending. Then he vanishes. After WALLER left Winchester the city again declared for the king. In 1644 the Parliamentary troops who came to attack it met the Royalists at Cheriton, and having overcome them entered the city. The castle, however, held out, and CROMWELL himself was obliged to appear. In his summons to the mayor he said, "I have commanded the soldiers, upon pain of death, that no wrong be done, which I shall strictly observe. Only I expect you to give me entrance into the city without necessitating me to force my way, which, if I do, then it will not be in my power to save you or it." After a breach was made in the wall of the castle the Governor surrendered. The siege of

Basing House followed, where CROMWELL was also victorious. Among the prisoners taken was INIGO JONES, the architect, and if VERTUE be correct, another was WENCESLAUS HOLLAR, the engraver.

The royalism of Winchester did not make the city appear a blessed place in the eyes of Parliament. In order to raise money to meet war expenses it was proposed to sell the lead off all the cathedrals in England, "nay, almost the cathedrals themselves, if any would buy them." The people of Winchester, apprehending danger, presented a petition against the "destroyinge and pullinge doune of Trinitie Church" (the title given by HENRY VIII. to the building) "theare scituate, an auncient and most beautifull structure, the most convenient and spatious place of assembling for the hearinge of God's word, whear many thousands of soules may be served and satisfied." Parliament discovered a way to make ends meet without selling the cathedrals, and Winchester did not lose its most important building. An effort was made by the citizens to raise loans to repair the cathedral, but they were either not sufficiently organised or were too indifferent to be able to obtain an adequate sum.

After the Restoration CHARLES II. condescended to select Winchester as a suitable place to reside in, and Sir CHRISTOPHER WREN was instructed to prepare plans for a royal house, which was to stand on the site of the castle, with a suitable approach from it to the west door of the cathedral. The building was never completed, but the parts which were roofed were used as a prison, barracks, &c. The fire which broke out a few years ago put an end to any scheme for realising WREN's plans. But if the people were friendly towards CHARLES II. they were inspired by hate of his brother, and they were punished by quartering an excessive number of troops on them.

The time was fast approaching when the favour of a king could not do much for Winchester or any English city. Queen ANNE, who was good-natured, would gladly have resided in a place which was connected with so many of her predecessors, and where the violence of contending Ministers would be likely to be subdued. But she discovered that her own desires were not important, and that her place was elsewhere. After ANNE's time Winchester had to submit to fate, and dwindle to the status of an ordinary assize town.

But as long as the cathedral endures it cannot be forgotten for how vast a period the old city was the stage on which the most important personages in English history appeared for a time. In the eighteenth century that sort of renown was not of much avail. Apparently the authorities of the cathedral would gladly have submitted to the influences which obliged the Court to reside elsewhere. The building was supposed to be a relic of a barbarous age. It was, strange to say, JOHN MILNER, Bishop of Castabala *in partibus*, who was the first to reveal the historic interest of the cathedral, and to demonstrate that its various parts also exemplified the development of English architecture. The state into which the cathedral had fallen was, however, enough to excite a sort of pity among archæologists, especially those who were able to realise the appearance of the building when kings and queens were among the worshippers. The following description of Winchester Cathedral in 1789 by JOHN CARTER will suggest the indifference of the authorities at that time:—

The cathedral, though it remains at this day (with little alteration) as it was left after the reign of Henry VIII., yet the neglect and contempt shown for its sacred walls is most glaringly manifest. In surveying this cathedral I was struck with the idea that it appeared in the same state as a building soon expected to be taken down to make way for a new erection; or, at least, to be entirely new modelled and modernised. Therefore, repairs of any kind to the present humiliated and suffering church would be altogether useless. At the west front I remarked that the parapet of the gallery over the three grand porches was in a most ruined state, many parts of it having fallen into the gallery.

On the north side of the nave I everywhere saw broken pinnacles, architraves and mullions of the windows; innumerable quarries of the glass were wanting—all together presenting a scene of general devastation. The appearance of the west front of the north transept is really disgraceful; an entrance into the transept is converted into a receptacle for all kinds of rubbish; a modern convenience usually to be met with in some part or other of our religious structures. It is impossible to command the indignation raised by viewing the groins over the

exquisite monumental chapel of Cardinal Beaufort,\* which are left in such a miserable state that the rain often deluges this wonderful object. Nay, so little is it respected that prodigious quantities of its broken minute parts are thrown by as so much rubbish. Are the revenues for the repair of this cathedral, like those of Gloucester Cathedral, wanting? I cannot pursue my observations on this structure any further. The recollection of the general debased appearance of the whole pile fills my mind with unpleasant reflections which, if communicated, some readers might conclude that I was actuated in my dissertations by motives not consistent with a "Christian antiquary" and an artist. However, I cannot forbear quoting a paragraph from the Rev. Mr. Milner's learned and interesting "History of Winchester":—"Whilst our eyes are yet feasting on the beauties of this unrivalled screen (the high altar of the cathedral), it is proper to mention that proposals have been made to demolish it, together with the oratories behind it, in order to lengthen the choir with the disproportioned aisles of the east end, in the manner that has been so absurdly done in Salisbury Cathedral. If any consideration could console us for the weak and tottering state of the whole east end of the church, from the tower to the extremity, it is that it will not admit of the removal of this stay against the inward pressure of the walls and buttresses without falling in ruins upon the heads of its presumptuous violators."

Some years afterwards JOHN CARTER again visited Winchester, and he found few changes. The west front continued to be neglected. The north transept was cleared from rubbish, but it was still shut out from the rest of the fabric, as if it possessed neither use nor beauty. A few repairs were going on in the choir, but otherwise JOHN CARTER could discover no trace of ecclesiastical care. The continental wars were not without their effect on the restoration of English churches and cathedrals, for people of all degrees were afraid to expend money, as the future was uncertain. But in 1816, when peace was restored, Winchester began to experience a change, as in that year restoration was commenced, and in less than twenty years a sum of about 40,000*l.* was expended on the repairs of the cathedral. Of late years much costly restoration has been also accomplished under the direction of Mr. JOHN COLSON.

## THE ARCHITECTURAL ASSOCIATION.

THE ninth ordinary general meeting of the above Association was held on Friday evening last in the rooms of the Royal Institute of British Architects, Mr. W. H. Seth-Smith, vice-president, in the chair. The minutes of the last meeting were read and agreed to, and several nominations announced. The following gentlemen were elected members:—Messrs. H. W. Currey, S. Holderness and A. Williamson. Mr. T. G. Sankey has been reinstated a member. A vote of thanks was passed to Mr. Owen Fleming for his attention on the occasion of the visit to the London County Council working-class dwellings at Boundary Street, Bethnal Green.

Dr. F. S. Granger, M.A., then read his paper on

### Greek Sculpture and Greek Legend.

When I was asked to read a paper before this Association, I purposely chose a title of some vagueness, in order that freedom of selection might be left me. Let me begin, then, by marking off beforehand the precise subject of the remarks which, with your indulgence, I am about to offer. The sculpture is that of the Acropolis of Athens; the legend is that of Athena, the divine protector of the Athenians; and both legend and sculpture are so intimately connected with the architecture of the Acropolis that I trust you, as architects, will not regard the time wasted which we shall devote to them.

The Greek temple as a whole—taking the building along with its ornaments—has never been surpassed for excellence of design, perhaps has never been equalled. This does not prevent us from agreeing that, as architecture only—building apart from sculpture—some of the cathedrals and abbeys of the thirteenth century are nobler works than even the Parthenon. But if you take the two together—architecture and sculpture—you must assign the palm to Greece. Interesting and beautiful as Mediæval sculpture often is, it falls short of the knowledge and technical skill of Greek sculpture. No one can seriously maintain that Mediæval sculpture, at any rate on this side of the Alps, is comparable to Greek work of the first or even of the second order. And this consideration will affect our estimate of Greek art as a whole. The excellence of the Parthenon, for instance, rests upon a certain balance of subordinate excellences. It is a perfection depending upon the harmony of different elements. I shall try to show how various the elements

\* In *The Architect* last week, when the Cardinal was referred to as the supposed cause of the evils of the reign of Henry VI., by a misprint Henry II. was substituted.

were that entered into this harmony; how architecture, sculpture, both applied to a building and standing free, and colour decoration, united together to express certain religious beliefs and to answer certain religious ends.

We need not be surprised, therefore, that the work of Stuart and Revett, by which Athenian architecture was made known, should have led, at the end of last century, to a revival of Greek architecture, and that Vitruvius and Palladio had to yield to the architects of the temples upon the Acropolis. This revival, however, suffered from the defects of most revivals. The architecture of Greek temples was applied to purposes for which it was unfitted. Moreover, the spirit of the style was misunderstood in a most important particular. Colour decoration was left almost entirely out of account. Greek buildings, on the other hand, showed a brilliant scheme of colour in which the white marble surfaces contrasted with the gold and blue and vermillion of the sculpture and the mouldings. Hanover Chapel, therefore, of which Mr. Paul Waterhouse has given an interesting account in the "Journal" of the Institute, was not a building in a truly Greek style. Architects have tried to convince themselves that certain rules of proportion are enough to insure impressiveness of design. But the public takes little interest in the geometrical recipes of which we have heard so much, and here for once the public instinct is correct.

Greek architecture in England has suffered still more seriously from being used without the sculpture, for which the pediments and friezes offer the frame. Reference is sometimes made to the fact that the entrance to the Athenian Acropolis, the Propylæa, had no sculpture in its pediments. There is reason to believe, however, that the original plan included this sculpture. Greek architecture stands, then, in the most intimate relation with the allied arts, and some of its apparent defects arise from the necessities imposed upon it by this relation. A building in the Greek manner, without plastic ornament and without colour, falls as far short of the true spirit of the style as the pale shadows of the Greek after-world over against breathing men and women.

The very fitness of Greek architecture therefore for its special purposes led to its being found unsuitable under the changed conditions of English life. It furnished very obvious handles for attack to those who admired the Mediæval styles, and much was said about its imperfections. After these two stages, first of indiscriminate imitation and then of equally indiscriminate rejection, there is come the third stage, that of the temper that judges, the critical stage. We are ceasing now to take sides, and are trying to understand. There is a very large public—I speak comparatively—which is interested in the development of ancient Greek art, and the studies of several generations of archæologists are converging upon fairly certain results. I am attempting this evening to focus some of these results upon a familiar field of architectural study, in order that it may appear in its true light. I should be glad to think that we carried away a somewhat clearer idea of the actual achievement of Ictinus and his fellow architects. We owe to Mr. Penrose a more correct idea of the exact structure of the Parthenon. There remain the further and secondary considerations on which I have touched.

It has sometimes seemed to me that when we go back to antiquity, whether of the Greek world or of the Middle Ages, we ought also to carry with us the method and temper of the ancient critics. Matthew Arnold, in his essay upon the "Study of Poetry," has formulated a method which is strikingly in accordance with their precepts. He suggests that the student of poetry should carry in his memory a few fine lines of poetry and apply them as touchstones; not, indeed, because all fine poetry is alike, but because our judgment becomes more acute when it has before it the materials for a comparison. Let us apply this to the criticism of architecture. If we become thoroughly familiar with the design and detail of one or two fine examples in each kind we shall have with us a standard by which we can measure the quality of any work that may be set before us. We shall not, indeed, ask that the details of the building that we are judging shall be like those of the test example. We shall find, however, that the faults of a building of second or third-rate design will be more apparent in the presence of really good work. Such a method, it seems to me, is also the right one for those who are themselves engaged upon design. If the mind is continually refreshed by the study of fine examples, it will become better able to criticise its own work. This is the ancient method of imitation as opposed to the modern. Let us turn back for a moment to Hanover Chapel. We are referred to the Temple of Athena at Priene for the details of the external order, and to the Erechtheum for the general proportions of the front. St. Pancras Church goes much further even than this. The building is like a composite photograph in which half the buildings of Athens are struggling for the first place. "It is a poor temper," says an ancient critic, "that is content to follow closely that which is being imitated." Hence it may be said of most of the buildings of our Greek revival that they are not in the Greek manner. It may seem a somewhat barren conclusion to this part of my

paper, but I do not know how to express it better than by saying that the distinguishing feature of Greek art is a disinterested love of beauty. In contrast with our modern effort to be striking, or to be edifying, the Greek was content to be confined within the limits of his own art and to seek the beautiful. The pursuit of truth for its own sake, and apart from technical purposes, finds little encouragement in the present; the pursuit of the beautiful finds even less. It is the imperishable glory of the Greek mind that it devoted itself with an enthusiasm that has never been surpassed to these two great ends.

Let us now see how the Greek love of the beautiful found expression in the works of art upon the Athenian Acropolis. This oblong eminence was the centre from which the city spread and contained the sites of the greatest sanctity. It was the Mount Zion of Attica. Long before the Persian invasions, long before the building of the Parthenon and the Erechtheum in the shapes in which we know them, Athena was worshipped upon the sacred spot to the north of the Parthenon. Several legends grew up round the place. According to the belief of the Athenians, Athena had originally to contend with Poseidon, the god of the sea, for the worship of the Athenian state, and the visitors to the Acropolis could see the olive tree which Athena made to spring up as a proof of her power. Her rival Poseidon, to show his power, cleft the rock with his trident and a spring of salt water gushed forth from the place. The King of Athens, who acted as arbitrator, awarded the palm to Athena. The contest was represented in the sculptures of the western pediment of the Parthenon.

The eastern pediment of the same building portrayed the birth of the goddess. According to a quaint old legend she was born from the head of Zeus. A black figured vase shows us how the event was imagined by the Athenians of the sixth century. Zeus is sitting upon a throne with a lion's head at the back and a winged sphinx underneath as a support. He is robed in a tight-fitting tunic, and a mantle is thrown round his shoulders. He holds the lightning in his right hand and gesticulates with the left, while from his head Athena springs up equipped with shield and spear. Ilithyia, the goddess of childbirth, stands before Zeus, and moves her hand in a characteristic manner. Still further to the right is Ares, the war-god, armed with lance and helmet and with the Medusa shield. Behind the throne Apollo celebrates the joyful event by music on his lyre, and Hermes, the messenger of Heaven, with his winged shoes, traveller's cloak and broad-brimmed hat, is ready to carry the news to Athens.

There is no reason to doubt that the ordinary Athenians believed sincerely in these legends. So strong was their belief that the tyrant Pisistratus took advantage of it, and by a curious device secured his return from exile. He dressed up a tall woman in the attire so familiar to the city, and the people seem to have been deceived into thinking that their divine patroness was recommending them to receive back Pisistratus when he rode to Athens with the pretended Athena by his side. In the height of the glory of the city the same sincere simplicity of belief was still shown. During the building of the Parthenon a wonderful piece of fortune befell, which, says Plutarch, showed that Athena did not hold aloof, but was helping to accomplish the work. A very active and zealous workman slipped and fell from the scaffolding, and was in a condition so dangerous that he was despaired of by the physicians. Pericles was affected painfully by the accident, but was visited by Athena in a dream and was informed of the remedy. Of this he made use and the man was healed. In order to record the event the great statesman erected a statue to the goddess as the giver of health, Athena Hygieia, and the pedestal of this statue with the inscription is still to be seen at the entrance to the Acropolis. I do not know why we should accuse Pericles of hypocrisy here; other Athenians of the most brilliant intellectual endowments were characterised by the same devout temper as that which in their descendants struck the Apostle Paul 500 years later. Athens was not only the centre of the profoundest culture, it was also one of the most religious cities in Greece. The conclusion to be drawn is a very important one. It was first and foremost through the religious emotion that the masterpieces of Phidias and his contemporaries affected the average Athenian. Only in the second place was note taken of their perfect workmanship. The rude wooden image in the Erechtheum that fell from Heaven, before which the famous lamp of Callimachus for ever burned, was doubtless more revered than the great statue of the neighbouring Parthenon. The artist was not the master but the minister of the religious feeling, and ran great risks if he turned aside from his appointed task. Phidias was imprisoned upon a charge of impiety because he had portrayed himself and Pericles upon the reliefs of the great shield of Athena.

As the character of the Athenian state changed so also did the character of their goddess. When the Athenians were a people of farmers she was thought to give rains and abundant crops. Hence, in the eastern pediment of the Parthenon she is accompanied by the Hours who bring the harvest season and

by the Sisters of the Dew. As the goddess of the sailor she contrived the magical vessel in which the Argonauts sailed to find the golden fleece, and her temple on the promontory of Sunium brought comfort to the ships that beat round that dangerous coast. As the patroness of victory she was called Athena Nike, and in order that she might never desert her people she was represented without wings. But the goddess was more than the patroness of the farmer, the merchant and the soldier; she was the embodiment of wisdom. It was her inspiration that guided Odysseus on his wanderings, and Heracles throughout his labours. This ideal figure which reflected so closely the interests and aspirations of the Athenian state was boldly identified with the democracy, and worship was paid to her as Athena Demotia, the personification of the people. There is a beautiful little relief in the Acropolis Museum; it represents the goddess leaning pensively upon her spear, her eyes fixed upon the memorial stele before her, which may be supposed to contain the names of deceased warriors. This charming design shows that she could sympathise as well as inspire.

We may enter now, perhaps, into the spirit with which the Athenians celebrated every year the birthday of the goddess at the great festival of the Panathenæa, July 28. This began in the early morning with a procession to the Acropolis, in order to offer a new robe, or peplos, to the goddess—a piece of saffron cloth embroidered elaborately with the conflict between the gods and the giants. This robe was conveyed in state along the streets to the Acropolis, and there was hung round the great statue, or perhaps before it, as a curtain. Let us take the ideal figure of Athena as a clue, and let us join, so to speak, in the procession of the citizens of Athens. We shall find that the great masterpieces of plastic art are all, as it were, set to the key of this religious ceremony; the main idea of it—the birth, the power and the honour of Athena—being like a pervading diapason. The sculptures of the Parthenon are not exercises in which merely the skill of the artist is displayed; they are the vehicles of living religious ideas.

As we approach the Acropolis, let us suppose that the magic of fancy has restored to their former splendour the ruins of the entrance and of the temples which lie beyond. By the careful comparison of the actual remains and of the literary evidence the archaeologists of this century have gradually restored the arrangement of the works of art upon the Acropolis, and we are enabled by their aid to substitute for the existing ruins a picture in which the buildings and the sculpture are united into an harmonious whole. The view is taken from the restoration of Thiersch. One of the most prominent objects was the colossal bronze statue of Athena the Defender, which rose to a height of 25 feet. The point of the spear was visible from a great distance, and the sailors, as they were tacking up the Saronic Gulf from Sunium, kept a look out for the moment at which the familiar landmark should appear across the low hills of the coast. This work has perished, without leaving any visible trace, except a rough representation upon certain coins.

As you pass between the columns of the Propylæa on to the rocky plateau, the eye is caught by the rich colour of the crystalline limestone rock. It is of a heavy red or maroon passing into dark purple or indigo. But in some lights the effect is changed. My first view was gained one evening as the sun was nearing the horizon, and the rays of light, which were almost level, so struck the surface of the limestone that it seemed of a light rose colour. Against this the white columns of the Parthenon stood out with great streaks of dull gold where they were stained by the weather, while, behind the rock and the white marble and the weather stains the clear evening sky formed a background. In a well-known passage of the "Seven Lamps," Mr. Ruskin compares to their disadvantage the Greek temples with the coloured architecture of Venice. But nothing can be more wonderful than the strange flickering of the white marble columns as they seem to flame out against the blue. Over this brilliant foundation coloured ornament was applied, like a delicate embroidery, to the chief architectural features. As you pace the summit of the Acropolis you can see many a marble moulding still carrying the traces of this.

Colour was applied to sculpture by the Greeks not less systematically than to their buildings. It is curious that the notion of coloured statuary should be so repugnant to the prevailing taste, and yet there is scarcely a museum of classical antiquities in which traces of colour are not to be found. We saw that, for want of colour, Mr. Cockerell's Hanover Chapel, with all its elegance, was not in sympathy with the true spirit of Greek architecture. Let us proceed to note that the modern schools of sculpture, which professedly derive from the antique, are separated from their originals by a similar interval. I do not mean to assert, of course, that such buildings and such sculpture cannot be of the first order without the use of colour, but I venture to maintain that they are parodies rather than imitations, if we view them with respect to their originals. We have no less an authority than that of Praxiteles, the sculptor of the Hermes of Olympia, for saying that sculpture is

benefited by the application of colour. The recent discovery of the beautiful sarcophagi at Sidon, with their exquisite colouring, has furnished us with a standard by which we may appreciate other works of art that have been less fortunate. "The colour thus applied," says Professor Gardner, "does not obscure the texture of the marble nor the delicacy of the moulding; on the contrary, it makes both more visible by giving a variety to the monotonous whiteness of the surface; it relieves the fatigue otherwise caused by the study of colourless form, and assists the eye to observe many subtleties of modelling which it might otherwise be unable to appreciate." I am quoting from the excellent handbook of Greek sculpture recently published by Macmillan. The author was, until recently, the director of the British School of Archaeology at Athens, and in that capacity has laid many English travellers to Athens under very deep obligations. I had the advantage of Mr. Gardner's company during one or two visits to the Acropolis, and I gladly avail myself of this opportunity of acknowledging my indebtedness. Mr. Gardner has succeeded to the chair of archaeology in University College, London. I hope my paper this evening may lead some of the members of the Architectural Association to follow the subject further, and to take advantage of Professor Gardner's courses.

I am supposing that we have now passed by the great bronze statue of Athena, and that we have the Erechtheum on our left. While the modern architect is struck by the irregular disposition of the building and the refined delicacy of its detail, the Athenian would think of the venerable image of the goddess, of her sacred olive tree, and of the salt water spring of the sea god. The beautiful figures of the southern porch have also a sacred office; they are really representative of the young girls who carried certain sacred baskets in the triumphal procession. Does it not seem as if they, too, were about to fall in with the company, as they stand there with one foot moving forward? If the maidens of the Erechtheum seem to be moving towards us, the figures on the frieze of the Parthenon are keeping pace with us. For between the columns of the Parthenon we catch continually fresh glimpses of a band of sculpture, the marble counterpart of the procession of the Athenian people for ever travelling towards the eastern door. The example is taken from the western frieze, and represents some of the Athenian cavalry. It is specially interesting for the beauty of one of the heads. This type seems to have been imitated widely upon contemporary coinage. But we must not stray very far into the bypaths that open on either side; the procession is still moving on towards the eastern entrance. In the centre of the eastern frieze the chief person in the Athenian hierarchy, the Archon Basileus, receives from a boy the new robe that has just been brought for the divine guardian of the city. When the spectator reached the eastern end of the temple he found overhanging him the great cavernous pediment in which the more than life-size sculpture stood out from the background with almost oppressive reality. Surely there, on the annual festival, as the horizontal rays lit up the sculpture in the early morning, it would seem as if the mysterious birth of Athena were happening. The crude realism of the vase painting which we studied a short time since could not satisfy the great artists who worked upon the Parthenon. Fortunately there is a relief, now in Madrid, which enables us to imagine with some likelihood what the central portion of the group must have been. We may suppose the sculptor to have dwelt rather upon the mystical signification of the old legend; the coming forth of a spirit of wisdom from the mind of the supreme god, wisdom strong in the possession of spear and helmet and buckler—with the spirit of victory reaching forth the olive crown in the sure confidence that it would be earned. It would be difficult to exaggerate the influence which this vivid presentation of their patroness exercised upon the Athenian mind; even the most foolish of the Athenian orators must have been sobered, and the most stupid have had some glimmering of intellect, when from the assemblies of the citizens in the plain below they looked up to the Acropolis and thought of all that it meant. When Constantine in his new capital dedicated his great church to the Holy Wisdom—Santa Sophia—the dedication was in striking harmony with the ideal embodied in Athena. If the influence of the goddess floated down from the Acropolis upon the city below it found its concentrated expression in the great statue of Phidias. Of the statue itself every trace has perished, and we must seek a substitute in the copies that have survived the wreck of the classical civilisation. Of these the most useful is the little statuette found near the Varvakeion Gymnasium in Athens, and named from the place of its discovery. "The statue," says Pausanias, who saw it in the second century of the Christian era, "is made of ivory and gold. In the middle of the helmet is a sphinx and on either side there are griffins. The goddess stands erect, clad in a robe which reaches to her feet. On her breast is the head of Medusa wrought in ivory. With one hand she supports a Victory of about four cubits in height, and in the other she holds a spear. A shield is placed against her feet, and near the spear

is a dragon. On the pedestal the birth of Pandora is represented." The little statuette is concordant enough with the description of Pausanias to make us think it to be a fairly accurate representation of the general composition of Phidias's great work. There are still remaining traces of colour of red and blue upon the sphinx and of red upon the ægis. But the statuette falls far short of the style of the original. Let us correct it by reference to a head found near the Acropolis. It is supposed to be copied from the work of Phidias. The eyes have been represented by a bony material inserted in the sockets, and the hollows of the pupils were once filled in with some gem or enamel. The hair was gilt, as we may see from some traces, and the head was covered with a helmet. I know scarcely any other object which enables the modern better to realise the vivid effect of Greek sculpture; its power "to bring the living features out of marble," a power so poetically figured in the legend of Pygmalion.

With these introductions let us enter the presence of the great statue as Fergusson, I think, has restored it. The details of the restoration are more or less open to question, and although I trust the drawing fails to do justice to our conception of the goddess, it may serve to concentrate the ideas with which we have been occupied.

Let us sum up our conclusions. We began by observing that the architectural surroundings of Greek sculpture were rendered much more vivid by the help of colour than modern architecture designed in Greek styles would lead us to expect. We noticed, further, that the use of colour in sculpture must have produced an effect somewhat unfamiliar to our modern taste. These two considerations warned us against supposing that we have really fathomed all the meaning of Greek art. We noticed, also, that the real source of the artistic unity of the works of art upon the Acropolis was to be found in certain beliefs, of a religious character; beliefs which offer some striking points of resemblance to the Mediæval beliefs which, in their turn, found a similar expression in sculpture.

Let us contrast these conditions with the conditions of the present. There now in England is no general and vivid imagination of sacred personages and events to which the artist can appeal, or to which he can minister. I am not concerned to discuss whether such an imagination does or does not deserve cultivation. I am merely stating a fact which is of transcendent importance for the public interest in sculpture. Secondly and lastly, by foregoing the use of colour, the architect and the sculptor resign the most powerful charm at their disposal. I will ask you to think of the drab stonework and the dull sculpture of the British Museum façade, and when you have done so, to agree with me that Greek architecture and Greek sculpture have never been really revived in England.

The following were among the lantern views shown on the screen:—Hanover Chapel, Regent Street, W.; the Athenian Acropolis from the south-west and north-west; the Parthenon, and sketches of the pediments; the birth of Athena; Athena victorious over a winged giant; Temple of Athena Nike; the entrance to the Parthenon as restored by archaeologists; the columns in the Parthenon; Archæological College, Athens; the Erechtheum and southern porch of same; frieze of the Parthenon; portion of frieze showing the Archon Basileus receiving the robe; relief, in Madrid, representing what perhaps was the eastern pediment; statuette by Phidias, with side view; and fragmentary head found near the Acropolis.

Professor Gardner thought the best way to show their thanks and appreciation of such a paper was to pursue their study a little further. The application of colour was the secret of Greek sculpture, and it was in this loss of colour that our modern Greek imitation suffered. The different conditions of the two countries should be remembered. The dazzling light of Athens necessitated this colouring, otherwise it would have been painful to look upon purely white sculpture. Some believed that when colour was applied its object was to obscure inferiority beneath. This could hardly be the case, as all colour was applied in moderation, and not on broad surfaces. The main surface was never covered with pigment; it was only the small details, such as hair and teeth. The whole garment was never painted, but sometimes a border of flowers on the cloak would be picked out. In this way the small surfaces contrasted with the others. The sculpture gained in expression under this treatment and the figures appeared to live. The conditions in London for following the Greek style were extremely different, but to erect a building devoid of colour was a thing no Greek would have thought of. Colour was used freely on inferior sculpture, not as a contrast, but to cover up the worst parts. He said that if any members of the Association cared to call at his library on Mondays, Tuesdays or Wednesdays he would be pleased to explain and give help to them on the subject. He had great pleasure in proposing a vote of thanks to Dr. Granger.

The Chairman asked whether the Greeks used primary or pure colours instead of secondary colours.

Professor Gardner replied that the Greeks undoubtedly used primary colours, but owing to the extraordinary light of

the atmosphere they did not appear harsh, whereas secondary colours or half-tints would have been very unsatisfactory.

Mr. Skipworth said he was struck on his return to London by the peculiar dullness of the ordinary buildings due to the climate. The British Museum offered varieties of light and shade, but it would be greatly relieved by gilding and colouring, in the same way as buildings in London could be relieved by introducing glazed tiles.

Mr. G. H. Fellowes Pryne, in seconding the vote of thanks, said that one of the lessons to be learnt from the paper was that the craftsman should be more in touch with the architect, who should rely more on the craftsman, who ought to live and work for art's sake, not simply consider it a matter of £ s. d. Regarding the application of colour it was one of the greatest difficulties of the present day. Perhaps we had a right to carry colour a little further than the details, but then the question was how far?

Mr. Banister F. Fletcher also spoke, and the Chairman put the vote of thanks, which was carried unanimously.

It was announced that the next meeting would be held on March 19, when Mr. J. A. Gotch will read a paper on "Eighteenth Century Architecture," with lantern illustrations.

## GESSO.\*

(Concluded from last week.)

TAKING for illustration earlier work rather than that of the modern frame-maker, mention may be made of a small frame in South Kensington Museum, decorated in Italian arabesques in very low relief. The run of ornament must have been squeezed in a mould and laid on while still soft to the wooden framework, and following the curve.

In a similar way small jewel caskets were frequently decorated with groups of tiny figures, each taken out of a mould and laid on separately while soft. You may often see where a figure is pushed up from behind by a part of another figure which it overlays. Frequently in a crowd of figures many of them are absolutely similar, showing that they are but adjustments of squeezes from one mould. Sometimes, where bits of the figures have fallen off, the gold background on which they are laid may be seen passing behind them.

Though clearly put on soft they have not been so soft as to be flattened by the slight pressure necessary to fix them in place, a brush touch of soft gesso probably being first laid on the ground to receive them. The particular kind of sharpness which these figures exhibit suggests the sharpness of the mould, nevertheless they may have been finished with the brush and knife. The outline of the figures is approximate only and squarish, the edges of them after lifting from the mould having needed trimming with the knife. In the South Kensington Museum (No. 317) is a heavily clamped box profusely decorated with squeezes of equestrian figures from three or four moulds. They are beautiful and very sharp, yet the paint-brush was resorted to, to some extent, for the making out of the features.

You can mould in plaster from thoroughly dry and well-oiled gesso, and a gesso squeeze will lift out of the plaster-of-Paris mould well oiled. The ornamental detail of most modern frames is practically "compo" squeezing, frequently from moulds carved in reverse in hard wood, the carving of which forms quite a trade in itself.

From the point of view of artistic principle, obviously in this squeezed work there is danger—the danger of the over-application of it where repetition does not sufficiently justify it, or of its misapplication as to furniture and in other similar situations, where it seems to pass itself off as wood-carving. It has even been grained in paint. Pursuing this thought, it may be surmised that even in the coffer decoration, under consideration above, though the work was certainly executed by hand and brush, a certain haste and wholesale execution and oft-repeated design carried into the workshop a mechanical element. If greed reduces a man to a machine, it will soon be felt that an iron machine, if not cheaper, will do the work more submissively, perhaps with more uniformity; and already, early in the sixteenth century, gesso was being relegated to the squeeze. The preponderance of interest which, during the last three centuries, artists and patrons have taken in picture-painting has also had its effect. It has allowed the preservation of tradition of many of the arts, not painting, to fall into the hands of the manufacturer, and not unnaturally he keeps them to himself. Consequently the student now, harking back to an old craft, has to work on somewhat in the dark; and it will be understood that proportions and recipes offered in this paper are subject to constant revision by each experimenter. The artist must be content to work on along more or less empirical and amateurish lines, but helping to re-establish tradition amid

\* A paper read before the Applied Art Section, Society of Arts, by Mr. Matthew Webb, on Tuesday, March 2, 1897.

an open brotherhood, by adding experience to experience, and giving experience. This he will do, for the ways of art cannot be the ways of commerce; it is on his general capacity as an artist he must rely for success and not on a craft-secret. But it is generosity we may be very sensible of when a firm comes forward to let one, as it were, and to some extent, inside the workshop. Behind an unostentatious shop-front in Rathbone Place, Oxford Street, is a veritable hive of workmen occupied with mould and squeeze, helping to carry on a business established in the last century, which in that day was collaborating with the Brothers Adam in their stucco decorations. It is the business of Messrs. Jackson & Sons, members, I believe, of this Society, who have sent down here for to-night objects to illustrate part of our subject.

To resume consideration of what is of most concern to the gesso-worker, viz. hand-wrought work, it may be explained that squeeze gesso has been dwelt upon at some length, because of the fact that in the consistency for the squeeze the worker has a gesso which may be modelled with some facility by finger and modelling tool, keeping both oiled so as not to stick.

To pass rapidly to the conclusion of the practical part of the subject, it has been seen that gesso will take the graver and knife, for what is that chasing of the gesso ground but incipient carving? It is possible then to model in gesso and then carve it if desired, and so carry gesso-work to further developments. Though perhaps for heavier relief and by the skilful modeller stucco would be preferred to gesso, yet gesso is far more under control, and recommends itself more naturally to the artist who has been in the habit of realising his conceptions in paint.

It may be pointed out, too, that a material like alabasterine, which is a stucco, not a gesso, may, except with care, easily be used beyond the moment when it still retains its setting power, after which it will depend solely on the glue ground up in it for its hardening; whereas in gesso-work it is accepted from the first that hardening shall depend entirely on glue and oil.

Speaking of stucco, there are two or three fine pieces of modelled stucco in South Kensington Museum, and in fairly high relief. No. 4 in the Italian Court, a "Nativity," school of Donatello, and No. 1,619, a "Rape of the Sabines," may specially be pointed out. Many Italian stucco reliefs are, I suspect, really casts. In the Italian Exhibition some years back, at the New Gallery, were two so-called gesso reliefs of "Madonna and Child," so adroitly differenced by painting that only on examining the modelling could you detect that clearly one of them, and more probably both, were casts, more likely in stucco, from a mould.

On marriage chests in the South Kensington Museum there is heavy modelling which looks like gesso. The cracks in it are the cracks which gesso would take, and the forms are still soft and fat, though the relief for gesso-work is high; the surface before yielding smoothed probably with water and brush. At any rate, though roughly executed, there very likely is true work in gesso-duro and in distinctly high relief.

With then the conception he may now have of it, in gesso the painter will find a material with which he may carry work far beyond the limit of decoration: a material susceptible of impress from his own hand, more durable because less breakable than plaster, which hardening does not need intervention of the moulder and remains the artist's own handiwork. Be this work called by some other name than "gesso," or called bad names, modelling and carving tools do give ways of treating gesso, the substance itself so treated is gesso, and to repeat, is connected easily with the painter's previous practice. In it he has sympathetic materials and methods with which to reach some subjects and treatment of subject which, by the closer realism of painting only, would be drawn out of a proper sphere of poetic abstract. For coloured relief is not an increase of realism, but the reverse: coloured sculpture in the round may be, but low relief is necessarily a convention, less realistic as modelling than the round, and yet, by the very departure from the flat, the relief makes it impossible for the painting to be realistic. It is really two removes from realism; by the convention of relief and by the convention of colouring obliged by the relief.

The design should be suitable to expression in relief, and should also need painting. The work should be thought of as one art, where of the full attainment the modelling falls short without the finish of colour, the painting without the underlying modelling. Paint a piece of sculpture finished from the sculptor's point of view, and you spoil it; but in many an old painting on the flat the work seems to suffer a confusion for want of modelling in relief; raise some parts of it, and it would be no less beautiful, no less removed and ideal, but all more rational and intelligible; conversely many a relief, without being exactly bad art of its kind, suffers confusion for want of colour.

Though gesso-work may be left in the raw, and beautifully so, it may be coloured in water, tempera, oil, wax, turpentine, or any of the vehicles ordinarily in use in a decorative painter's general practice, and in lacquers. Oil is likely to be the more

durable, goes better with the nature of gesso and with oil-gilding. About gilding there might be much to say; of course it is not essential to gesso, but gesso is decorative or nothing, on which account gilding is valuable, as it always breaks realism and forces you to be decorative.

But the artist will not stop at paint when he sees that he can fix into the gesso burning points of light by glass or precious stones, as in many an old painting, and as may be noticed in that precious ruin belonging to Westminster Abbey, till lately just inside the gate leading to the south aisle of the choir, part most likely of altar furniture, a piece of work quite at the beginning of the fourteenth century. In this work is, I think, still left one precious stone together with two pearls. There also may be seen left into little troughs full of gesso pieces of glass cut to shape. On the surface of the glass away from the eye, and to be viewed through the glass, has been painted a pattern more or less geometrical; over the entire pattern has then been laid gold, and showing through interstices purposely left in the pattern; when dry the whole was laid gold downwards into the bed of adhesive soft gesso. There were also in this relic many miniature medallions of heads in profile, clearly squeezes from antiques. Whilst I am speaking of this treasure, I may mention that internal evidence points to its being English work. Of so early a date, probably contemporary with Giotto, there is but little painting out of England finer than may be found there in the picture panels. It looks as though England must have had a splendid eminence in art prior to the Wars of the Roses. One reason of the sad condition in which this piece of work belonging to the Abbey now is, may be that the gesso ground was laid, as far as I can see, directly on to the wood, except where the wooden framework and panels of wood have had the joints covered by strips of parchment.

I may perhaps now make some general remarks, though expressive, it may be, more of personal preferences than of general principles.

Where gesso modelling is associated with pictorial art rather than decorative, there should, I think, be either very much modelling or very little. Interesting as is the gesso workmanship in Crivelli's great altar-piece in our National Gallery (Room VIII., early Venetian and Tuscan school), or the big "Adoration," by Gentile da Fabriano, in the Academy at Florence; that it is there at all, suddenly rising out of the painting on the flat, is in doubtful taste, compared with the rude but appropriate ornament on the coffer fronts which have been under consideration. In them though the scheme of colour, not counting the gilding or the faces of the figures, is very simple, confined to black and a transparent red; everything is expressed in the gesso. As a matter of fact, in conjunction with painting on the flat, and as that art progressed, the gesso-raising was early discontinued. In like manner, for backgrounds, the impressed or graven diaper seems better than the raised diaper, and more consistent with recession, some slight suggestion of which the background must still give, even in the most decorative work.

Raised or impressed, the diaper is valuable for this reason: one of the most important elements in pictorial treatment is the sky, with its aerial expression of distance; decorative treatment, on the other hand, is helped by the very exclusion of this element, and the diaper shuts it out and supplies its place in design.

It may be remarked that in the subjects of the various works considered in this paper for their display of gesso processes, there has been, more often than not, the hierarchy of a Mediæval Heaven under contemplation; and, further, it may be objected that the imagination to-day no longer dwells on the outworn story of saint and seraph. But the purpose was to show not pictures but craft processes, every one of which is applicable to the decorative rendering of such impressions as may be derived from present-day life around. It should be remembered too that, though perhaps their surroundings made with more singleness of heart for beauty than do ours to-day, to the artists who executed them, the coffer fronts we have admired may very likely have been up-to-date designs of figures, the originals of which, vivid with life, were passing the shop-door as the brush was dipped in the gesso.

To that part the gesso-worker to-day must turn with even-tender interest; and although art-history is not the business of the artist, it is a study not unprofitable, if from it may be drawn one moral, pathetic, yet assuring. Though individually workers soon pass away, though opportunity and ability missing each other, not many become expert, few are successful and most are soon forgotten, yet by the sum of experiment one generation after another, the art to which the workers gave their lives herself lives, survives and grows, monumental alike to the master and the *pictor ignotus*.

Gesso-work is necessarily rather small work involving rather slow processes; the difficulty therefore of doing within the evening anything in the way of demonstration which should be discernible and not teasing to the attention, has obliged me to confine myself somewhat to a mere talk about gesso-work.

There are, no doubt, many in the room who do gesso, and

it has been impossible to avoid saying what many of you know. So much has been written on gesso, from before the time of Cennino Cennini, among the Giotteschi, down to distinguished artists in our own day, that I have feared to weary your attention over the not generally interesting technical details of making and manipulation. If there should be any who care to ask questions relating to the practice I shall be pleased to answer to the best of my ability.

On behalf of an increasing crowd of workers, as I think, fascinated by gesso-work, I hope I may have awakened or stimulated the patron's interest in the artistic value of what he might possess in hand-wrought gesso. Though, in the very pleading for art I would add, let no one do too much possessing. Life must be simple to be, and to afford to be, beautiful. The modern middle-class average drawing-room spattered all over with art novelties is just so much time, attention, opportunity, money, labour thrown away over unconsidered ends.

That is generically most art which is done by the personal living hand, and has afforded happiness in the doing; but if the artist must accept some privation, and this is true to be an artist, so the patron must accept some sacrifice to enjoy the luxury of art. He who carelessly or assentingly enjoys art at the cost of the artist may gain a world of art treasures, but loses the soul to appreciate and enjoy them.

Addressing the student, always supposing him to approach gesso-work from the previous practice of painting, I would point out that he will see the obvious importance of studying modelling in clay or paste, and of studying the laws of low relief; this, too, without a mistaken conceit that he is really approaching the immeasurably more difficult, and for that very reason, humanly speaking, perhaps nobler, domain of the sculptor's art. Paint he should think of rather as a means of getting harmonious colour than as a means of getting verisimilitude.

He who would design for brush-gesso must do gesso; till he knows very well what he is about it is nearly useless to design in any other material. The gesso-charged brush of itself ultimately determines and reveals that limitation of designing to which he must confine himself.

Accepting the nature of the material and not wresting it by wilfulness, let the artist bear in mind that in any art the truest art of it lies along the path of concession to the nature of the material to be worked in; he may then safely resist tyranny either of material or theories.

This just domination by material is not inaptly expressed by the following lines, with which I conclude my paper:—

With tactile hand; live symbol, human, of activity;  
Sentient sure medium 'tween earth's clod and heaven;  
Link but material to intelligence;  
Man's works shall grow, while his poised soul may see  
That they are Art and his creations good.

## GLASGOW ARCHITECTURAL ASSOCIATION.

ON Monday, February 22, Mr. A. N. Paterson, M.A., in the chair, Professor T. N. Simpson, of Liverpool, delivered a lecture on "Reticence in Art."

All art, the Professor said, had its limitations, but no hard and fast rules could be laid down. The quality of restraint was the best quality an artist could possess, and the power of selection the best proof of a man's strength. No compositions of art, said the lecturer, were more original and displayed more reticence than were to be seen in the paintings and writings of Mr. Whistler. The limitations of architecture were more strict, as the possibilities were greater than the sister arts. A building should harmonise with its surroundings and form a part of the landscape. Old buildings always harmonised with each other, the principal reason being that reticence was given full place to in their design. Over elaboration, said the Professor, was one of the greatest evils of our modern buildings. A building may be a noble monument of architecture with practically no ornamentation at all. Referring to decoration, the Professor stated that the fewer colours used the more satisfactory would be the result. In wall decoration no more than two main colours should be used. In a living room, the Professor opined, the two colours should cover the chairs, hangings and other furnishings—other colours should be used sparingly. The lecturer then treated on the subject of mural decoration; this, he said, was the noblest branch of the painter's art. In England it was much neglected in the past, and was not yet properly encouraged. In Italy mural decoration was to be seen at its best, and the lecturer enumerated a number of the best well-known examples. The worst art in the whole world, said the Professor, was embodied in the modern school of Italian sculpture. Reticence they simply did not understand. In sculpture a greater amount of reticence had to be observed when it was related to architecture than when it stood alone.

Concluding, the Professor said that if the work we do be done honestly, it will be good, no matter whether it be rich or whether it be simple. On the motion of Mr. Wm. Jas. Anderson, seconded by Mr. Chas. R. MacIntosh, a hearty vote of thanks was accorded the Professor for his lecture.

A meeting of the Association was held on the 3rd inst., Mr. George S. Hill in the chair. Mr. D. Theodore Fyfe read a paper on "French Mediæval Fortifications." In introducing his subject the essayist pointed out that past work must be studied with respect to the conditions under which it was created. He proceeded to enlarge on the different types of the domain, a chief's dwelling, showing how this building evolved into the château of later times. The essayist gave a description of a number of the best examples, diagrams of which were ranged round the walls, and showed that every part of these fortifications had its origin in the laws of defence. We have the bartizan, which was primarily erected to strengthen the angles of the tower. Then there was the system of wooden hoardings, built out from the walls. The besieged by this means had an overhanging walk to enable them to defend every inch of their walls. To the development of these hoardings we owe the corbelled parapets which afterwards became so common. The essayist concluded by a reference to present-day architecture. If it is to be real, he said, it must be the outcome of an intelligent understanding of the wants of the age. On the motion of Mr. Alexander M'Gibbon, a hearty vote of thanks was accorded to the essayist. Thereafter the Chairman brought under the notice of members a question of public architectural interest. This was with regard to the proposal by the Lord Provost to commemorate the attainment of the sixtieth year of Her Majesty's reign by altering the present front of the Royal Infirmary, and building a new modern façade, which would possibly project further into the Square. Mr. Hill intimated that the committee had already discussed this question, and were strongly of opinion that no such proposed defacement should be allowed to take place, unless the alteration was to be of real lasting benefit to the patients; then no reasonable objection could be urged. The infirmary was a notable piece of architecture, and as it stood was in perfect harmony with its surroundings. Were this proposed alteration to be carried through that would be the case no longer. The members were unanimous in this matter.

## THE EGYPTIAN PYRAMIDS AND THEIR BUILDERS.

A LECTURE, by Mr. S. H. Capper, professor of Architecture at McGill University, has been delivered in Montreal, on "The Egyptian Pyramids and their Builders."

After noting the physical characteristics of Egypt, which, as an habitable country, consists solely of the bed of the Nile, rendered fertile by the annual inundations of the river, Professor Capper first dealt with the ethnology of the ancient Egyptians. At the furthest point to which we can trace them back in their monuments, some 6,000 years ago, there appear to be two, if not three, distinct races in Egypt, of which the dynastic race, probably the latest invaders, would seem to be allied to the ancient Phœnicians. It is surmised that these "Punic" tribes, leaving their original home on the Persian Gulf, made their way along the coast up the Red Sea, whence, crossing over into the Nile Valley, they conquered and occupied Egypt, becoming the dynastic race known to us in a long and magnificent succession of sculptured monuments. Other waves of this great tide of migration and conquest settled on the coasts of Philistia and Syria (the Philistines of Biblical history being one branch), and made their way further west to the famous settlement of Carthage and its offshoots in the extreme west of the Mediterranean. The Egyptians, when they first become historically known to us, are a people in a very high state of socially organised life, perfectly acquainted with the arts of masonry and sculpture, of carpentry and turning, of working in copper, of pottery-making, glazing, weaving and dyeing; in many respects their workmanship and works have never been surpassed by anything man has accomplished since their day.

Egyptian history begins for us with the fourth dynasty of kings, dating from the earliest years of the fortieth century before Christ. To the time immediately anterior to this dynasty the "Pyramid of Degrees," or Stepped Pyramid of Sakkara, is generally ascribed.

Within the last few years the Pyramid of Sneferu, first king of the fourth dynasty, has been identified at Medum and thoroughly explored. Though much ruined, it is in some respects better preserved than the more famous Pyramids of Gizeh; in particular the temple attached to every pyramid on the eastern side has in this instance been completely preserved, buried under piles of debris. The pyramid at Medum, known to ancient Egyptians as "Kha," is a most interesting link, showing the development of the true pyramid from the

truncated form known by the name of "Mastaba." This pyramid and that at Sakkara are the only instances of successive enlargement, the "accretion theory" of pyramid-building being shown to break down when applied to the great pyramids of Gizeh. Further, the pyramid at Medum was the direct model followed by Sneferu's successor, Khufu, when he built his much grander pyramid at Gizeh, the one having been brought to the true pyramid by a final layer or casing, built at a totally different angle from the original slope of the "Mastaba" core, while the other was built directly to the true pyramid angle. The dimensions of Sneferu's pyramid are: height, 7 by 25 cubits; side of square base, 11 by 25 cubits; those of Khufu's—"The Great"—pyramid at Gizeh being precisely similar, with a length of 40 cubits substituted for the 25 cubits of the earlier monument. This ratio of height to base-circuit, viz. 7 to 44, is precisely equivalent to the nearest simple approximation of the ratio of the radius of a circle to its circumference; and this theory of pyramid building seems to be well established by the most accurate measurements of modern times. The theories and paradoxes sought at various times to be established in regard to the Great Pyramid are almost innumerable; in comparatively recent times they have been chiefly associated with the name of Professor Piazzi Smyth, of Edinburgh, whose excellent work of solid investigation is sadly marred by the fanciful theories in which the learned explorer allowed himself to run riot. Within the last few years Mr. Flinders Petrie has given accurate data for the first time to the world, the result of a most painstaking scientific research illumined by great critical acumen, and in the works of this eminent English Egyptologist are to be found the most recent and most authentic statements of our present knowledge on the subject.

Turning to the pyramids of Gizeh, the lecturer was compelled by want of time to limit himself to a description of the Great Pyramid built by Khufu, the second king of the fourth dynasty, and known to the ancient Egyptians as "Akhet." It is one of the largest and—when completed—loftiest buildings achieved by man, covering some 13 acres with solid masonry, and attaining a height of 481 feet. The side of the base is (within 2 or 3 inches) 756 feet long. The accuracy of workmanship is probably unrivalled in all human building. The most careful modern measurements, taken with instruments of scientific precision, prove that the accuracy of levelling of the casing-stones of the Great Pyramid is equal to "most modern opticians' straight edges" of an equal length; while the descending entrance passage, partly built, partly driven through solid rock to a total length of some 350 feet, reveals an error of less than one-quarter of an inch in the sides and of three-tenths of an inch along the roof. This extraordinary accuracy, however, which is far greater than anything attempted in modern masons' work, is not true of the uppermost chamber within the pyramid, which is considerably out of level, a fact that would seem to indicate that the master builder or architect had passed away before the completion of his work, leaving it to less careful successors to finish. Mr. Flinders Petrie's researches had thrown great light on the mechanical methods of the pyramid builders and the organisation of labour. The remains of what were believed to be the barracks of the workmen still existed on the west side of the Second Pyramid, quite adequate to house from 3,500 to 4,000 men. In all probability some staff of skilled masons would be employed continuously; while during the period of the Nile inundation, when agricultural work was at a standstill and the people ready and thankful for employment, a special levy of perhaps a hundred thousand labourers would be requisitioned to quarry the stone on the east bank of the Nile, and convey it (by water) to the site at Gizeh. There is therefore great probability in the statement of Herodotus that 100,000 men were employed to build this pyramid, working during twenty years for three months at a time. Under the circumstances the pyramid building, far from being an oppressive exaction, would be a great scheme of public works, finding employment for the unskilled population at the season when they would otherwise be idle.

#### IRISH ARCHITECTURAL ASSOCIATION.

A MEETING of the above Association was held on the 2nd inst. in the Grosvenor Hotel, Westland Row, Dublin, when Mr. W. Kaye Parry, M.A., B.E., delivered a lecture on "Drainage and Sanitary Construction." There was a good attendance.

Mr. R. Caulfield Orpen occupied the chair, and amongst those present were Messrs. George M. Ross, M.A.; Albert E. Murray, C.E.; Joseph Holloway, M.R.I.A.; T. Slavin, C.E.; R. Butler, secretary; M. J. Tighe, &c.

The lecturer began by pointing out the most effective system of drainage and the best means to obtain a perfectly dry foundation. Cement alone was not effective in securing a dry foundation; it was too porous, but by amalgamation with other material the end in view could be attained. Pumping, no

doubt, drained the subsoil, but its cost was utterly prohibitive. Having pointed out the disadvantages of square and circular-shaped tiles, he said that the egg-shaped tiles were the most effective in so far as discharging velocity was concerned. Fire-clay pipes properly constructed were practically indestructible, and answered their purposes much better than iron-made pipes, as the latter did not last so long and were liable to become ineffective through the corroding influence of sewage acids. However, as regards the use of iron for soil-pipe purposes, he thought its use was justified. Medina cement was better than Portland cement, as it set much quicker; and as regarded intercepting traps, he confessed that those of the Buchan pattern were hard to beat. He condemned the construction of cesspools as an effective way of getting rid of sewage matter, and said that a drain once properly made should give no further trouble; but the point was to see that the materials were correctly used, and that the proper tests were applied before filling in.

On the motion of Mr. Tighe, seconded by Mr. Ross, a cordial vote of thanks was passed to the lecturer, and the proceedings terminated.

#### EDINBURGH ARCHITECTURAL SOCIETY.

At a meeting of the Edinburgh Architectural Society held on the 3rd inst., Mr. J. A. Williamson in the chair, Mr. R. S. Lorimer delivered a lecture entitled "Some Notes on the Artistic Work and Influence of William Morris." Mr. Lorimer traced the history of the firm of William Morris & Co. from its foundation; dealt with Mr. Morris as a craftsman, as a teacher and lecturer, as the founder of the Society for the Protection of Ancient Buildings, and as a publisher and printer, and showed some of the books produced at his Kelmscott Printing Press.

#### GENERAL.

**M. Henri Gervex**, the French painter, has received the cross of St. Anne (second class) from the Emperor of Russia. The artist is preparing a great diorama of the coronation of the Czar for the exhibition of 1900.

**The Rector of Lambeth** proposes to erect some lasting memorial of Archbishop Benson in Lambeth parish church. It will take the form of a font for adult baptisms, the late Archbishop having been very much interested in the erection of such a font.

**The Restoration** of the lady chapel of the church of St. Bartholomew the Great, West Smithfield, is in progress. The houses which have blocked a portion of the north side for over 250 years have been removed, and a considerable portion of the original flint and stone-work is thereby exposed. The dividing wall between the church and lady chapel, which is of brick, and has acted as a safeguard from fire while the chapel was in secular occupation, will not be removed until the work is nearer completion.

**A Museum** and art gallery will be erected in Plymouth as a memorial of the Queen's reign.

**A Special Exhibition** of meteorological instruments in use in 1837 and in 1897 has been arranged in commemoration of the Diamond Jubilee of H.M. the Queen at the Institution of Civil Engineers, Great George Street, Westminster.

**A Portrait** of Mr. Francis C. Penrose, F.R.S., ex-president of the Royal Institute of British Architects and surveyor to the Dean and Chapter of St. Paul's, is to be hung on the walls of the Institute, in recognition of that gentleman's distinguished services in the cause of architecture.

**The Committee** of the Society for the Protection of Ancient Buildings recently wrote to the Dean of Exeter to ask what was being done with respect to the repair of the west front of the cathedral. In the absence of the Dean, Canon Edmonds has written that the Chapter "do not wish to be brought into relations with your Society in the matter of what we are doing at the west front of the cathedral."

**The Next Ordinary Meeting** of the Institution of Civil Engineers will be held on Tuesday, March 16, at 8 P.M., when the discussion upon "The Main Drainage of London" and "The Purification of the Thames" will be continued and concluded; and a paper will be read with a view to discussion on "The Mond Gas-Producer Plant and its Application," by Mr. H. A. Humphrey, Assoc. M.Inst.C.E.

**The Prizes** for the Handicrafts Competition at the Building Exhibition will be given by Sir Arthur Arnold, late chairman of the London County Council.

**The Third Ordinary Meeting** of the Dundee Institute of Architecture, Science and Art for the session will be held in the Hall of the Young Men's Christian Association on Thursday evening, the 18th instant, at 8 o'clock, when a lecture will be delivered on "Architecture in the Reign of Queen Victoria," by James A. Williamson, A.R.I.B.A., Edinburgh, president of the Edinburgh Architectural Society.

# The Architect.

## THE WEEK.

WHEN will owners learn that it is not equitable, after selling a building site, to utilise another as a means for reducing the value of the purchaser's house? In more senses than one the adage is true that property has its duties as well as its rights, and surely among the duties must be consideration for those who have expended money in purchasing a part of the property. It is common enough to make stipulations which will prevent the buyers of building sites doing any act which will interfere with their neighbours' enjoyment, but it is no less necessary occasionally to put restrictions on the vendor. The case *BROOMFIELD v. WILLIAMS*, which came before the Court of Appeal on Friday last, is an example. The plaintiff bought a plot of freehold land with a house on it at Llandudno from the defendant. It was understood that the adjoining land was to be used by the defendant for building on, but it was not agreed that the plaintiff was to endure any inconvenience on that account. When the defendant's building was erected it was found that the kitchen and windows on the west side of plaintiff's house were darkened. This was owing to building closely to the plaintiff's boundary. An action was commenced, but Mr. Justice KEKEWICH, before whom it came, decided there was no right of action, although the access of light was materially interfered with. The plaintiff appealed. Lord Justice LINDLEY held there was nothing in the conveyance to exclude the operation of the Conveyancing Act, for it was possible to build on the adjoining land without darkening the windows of the house conveyed. His lordship relied on *MYERS v. CATTERSON*, in which it was held that a purchaser was entitled to all the light which his vendors could give him, and a grantor cannot throw on a grantee the onus of showing the limits to be set on rights incidental to the enjoyment of the property granted. Lord Justice A. L. SMITH also considered that the defendant was under an obligation not to build any house substantially higher than those already erected in the row, and that he was not to build over the part which was to constitute the passage. Lord Justice RIGBY concurred. Inquiry is therefore to be made as to what damages the plaintiff has sustained by reason of the obstruction of the light by the defendant's house not being set back, and the defendant is to pay such damages when ascertained. Defendant is also to pay the costs of the action and of the appeal.

WE can make allowances for the bewilderment of the Edinburgh town councillors, who, having an offer of 100,000*l.* to erect a public hall, cannot discover a site for the building within the boundaries of the city. But in order to get rid of the incubus, it is not becoming to mar the character of an interesting spot. It is proposed to remove seven houses on the north side of Charlotte Square, and to use the sites for the Usher Hall. Now the square, as all visitors to Edinburgh will remember, exemplifies an effort, and a very successful one, to treat lines of houses as a whole. Like other parts of the new town, it is evidence of a time when it was supposed there was much affinity between the Scottish spirit and the antique. The square is therefore an example of northern classic, and as such it merits to be preserved. To set up a big building which is to accommodate in one of its halls at least 4,000 people, will be (if scale has any influence) the dwarfing of the parts of the square which will be allowed to survive. As if to emphasise the contrast, it is intended to leave two of the existing houses on either side of the new block, but separated by a carriage way. The committee claim that the position has the advantages of being quiet, central and readily approached, which we grant. But why should property be deteriorated because it possesses those advantages, and an architectural work—for the square can be considered as one—be deprived of its character? Moreover, the purchase of the seven houses is likely to need the greater part of the money which Mr. USHER has offered, and the owners of the remaining houses will have grounds for action for damages on account of the depreciation of the value of their property. Edinburgh is supposed to have a society

of men of taste, who can be referred to in cases which are likely to affect the amenity of the city, but of late years the Town Council have assumed to be infallible, and the consequence is seen in such proposals as the destruction of a square which strangers cannot see without admiration.

BRONZE doors are costly, but if ever the expenditure required for their erection was justified it is in the case of the Palais de Justice at Brussels, which is one of the noblest of modern buildings. The great portal has a height of about 34 feet and a width of 14 feet. Mr. FERGUSSON considered the span was so large it should have been corbelled out after the Indian practice. The design for the new door was prepared by M. VAN MANSFELD, and the models were by M. HOUTSTONT. About 15 tons of bronze have been used, and in size and weight the door stands second to the Pantheon alone. In spite of its mass the door is easily moved, for steel ball-rollers are employed to avoid friction. The cost has been about 60,000 francs, which is not one-half of the sum paid for TRIQUET'S door in the Madeleine, Paris.

THE annual meeting of the Royal Irish Academy was held in Dublin on Tuesday. The report stated that during the year a large number of antiquities have been acquired by the museum. These include many bronze weapons and implements, swords, dagger blades, celts, &c., and two exceptionally fine specimens of rapiers. The Academy has also acquired a collection of upwards of 700 flint objects, including some very perfect specimens of a rare form of tanged knife blades and a representative collection of flint arrow-heads from the north of Ireland. This is the most important acquisition in this department, which the Academy has made for years. In addition to the foregoing some fine specimens of querns and over 200 other stone objects, two excellent collections of beads, and nine wooden objects known as otter traps, have been obtained. Two additional rooms in the Museum Building will shortly be made available for the display of the Academy's collections. The western gallery of the large central court has been for some months occupied by ogham inscribed stones and other large stone objects, which had been at first placed in the crypt. The Council regretted to say that they had not any communication from the Government as to the filling up of the post of curator of the Academy's Museum, which has remained vacant since November last. The Earl of ROSSE, K.P., was elected president of the Academy for the coming year.

THE sanitary committee of the Brighton Town Council have prepared a scheme for artisans' dwellings. The committee are unanimously of opinion that, in order to provide for men with families, it is absolutely necessary that three bedrooms should be provided, and further that none of these should be on the ground floor. A suggestion has, however, been made that some houses might be erected providing only two rooms upstairs, so as to provide homes for those workmen who have either only very small children or grown-up children of the same sex. The feeling of the committee is that while the home should be as comfortable as possible, still at the same time there should not be any undue expenditure in ornamental work. For this reason they suggest that the houses should be flush to the road, and without forecourts. A saving would thereby be effected of all forecourt walls. With regard to the smaller dwellings, the committee suggest that on the ground floor there should be a sitting-room, kitchen and lean-to scullery with two bedrooms above. With regard to the dwellings where three bedrooms are required, they are of opinion that the best way to build the house would be to construct it in three storeys, containing, on the ground floor, a sitting-room, living-room and lean-to scullery, on the first floor two bedrooms, with a third bedroom in the roof of the house. The committee estimate that the cost of building a four-roomed house with lean-to scullery would be 160*l.*, and adding to this the cost per plot of land, 27*l.* 10*s.*, it would make the cost of the small houses come to 187*l.* 10*s.* each. If, in addition to the four rooms, a room is built in the roof, the committee estimate that this would cost 25*l.* extra, which would make the total cost of a five-roomed house, with lean-to washhouse, come to 212*l.* 10*s.*

## WATTEAU.\*

THE French have reason to envy England for the gift bequeathed by Lady WALLACE. The Louvre possesses only one work by ANTOINE WATTEAU, *L'Embarquement pour l'île de Cythère*, of which we give an engraving this week, while there are several by the master in the Wallace collection. The deprivation is a satire on French taste. The picture in the Louvre was never purchased by French money. It was painted by WATTEAU as a diploma work, and if it were not for that circumstance the country of his birth could not show an example of one of her most illustrious painters. It is in foreign galleries in Berlin, Potsdam, St. Petersburg, Florence and Madrid, or in English private galleries, that the masterpieces of WATTEAU are to be discovered.

There is a reason for the neglect. WATTEAU, who was born in 1684, appeared at a time when French art was under the sway of Academicians and LE BRUN was supposed to have attained a level to which WATTEAU dared not aspire. He was, too, a product in which officialism could have no share. WATTEAU exemplifies one of those freaks which nature sometimes enjoys. He was essentially a painter of subjects that suggested a more refined court than was ever found outside a fairy tale. Princes and princesses might envy the grace of his figures, and his robes are enough to drive royal costumiers to distraction. And yet WATTEAU's father was no more than a *couvreur* in the semi-Flemish town of Valenciennes, and the boy could not have seen any ceremony that was worth a record during his most impressionable years. From the position of the family he was probably acquainted with poverty from his infancy. Throughout his life he was in delicate health, and he seemed to be one of those beings that melancholy had marked for her own. It is likely that with so frail a constitution he did not show much aptitude for assisting his father on roofs, while he may have made better drawings on his slate than the majority of schoolboys. GÉRIN, a painter, took him into his atelier, and from him he was passed over to a decorator, who at one time was able to obtain some work in the Paris Opera House, and brought young WATTEAU to assist him. When the task was completed the young artist was left to shift for himself in the capital. He was then about twenty years of age.

WATTEAU was friendless, and to secure food he was compelled to undertake the humblest work that offered. The bridges of Paris in those days were mainly assigned to the poorer representatives of the arts. On the Pont Notre Dame pictures were to be purchased which had as little individuality about them as if they had been produced by machines. They anticipated the landscapes and figure-pieces in oils with massive gilt frames which are now obtainable in the cheap furniture shops of London for a few shillings. The principle of the division of labour was not then discussed by political economists, but it was adopted in the establishment where WATTEAU was employed. Figures, trees, skies had their creators, and each colour had its specialist. WATTEAU had to take a turn of all when occasion offered. In return for his versatility he was rewarded with a plate of soup every day, and 3 francs at the end of the week. He must have suffered as much hunger as any of the inmates of Dotheboys Hall at a later time. His constitution was undermined by the deprivation of nourishment, and he reached a stage of misery when death was looked on as a redeemer. A good, well-fed and luxurious amateur, the Count CAYLUS, made him the subject of a moral discourse. WATTEAU was indifferent to the precepts. "Let the worst come," he said to the Count; "the hospital still remains for me; nobody is rejected there." It was the "De Profundis" of the artist whose works are now the gems of royal galleries.

Somehow he escaped from the Pont Notre Dame. He was picked up by GILLOT, a painter who was meeting the taste of the moment by producing pictures which were supposed to be representations of scenes enacted on the Italian stage. They served the same purposes as representations of negro minstrels in our days. WATTEAU refined the pictures and thus attracted a wider class of patrons, but at length GILLOT's susceptibilities as an artist

were touched, and he got rid of a man that, as an employer, he should have cherished.

WATTEAU could not yet stand alone; he was therefore very glad to become an ornamentist under CLAUDE AUDRAN, who was engaged at the Luxembourg. He was a shrewder and more honest man than GILLOT. He did not endeavour to exhaust WATTEAU's productiveness. He allowed the artist time to make drawings from the pictures by RUBENS and to sketch in the gardens. There may have been some selfishness in the guidance of his assistant. He wished to keep the young artist as an auxiliary, and for that purpose the development of his skill was advantageous. When therefore WATTEAU tried his hand on an easel picture, AUDRAN advised him to abandon such experiments. WATTEAU, however, was able to find a purchaser who gave him sixty francs for the picture. Such good fortune was not anticipated, and the money he utilised to visit Valenciennes. There he produced a companion picture, for which he received 100 francs. But as patronage was not visible in his native place, he was forced to return to Paris.

In those days, there was an amateur named CROZAT who was very anxious to obtain possession of WATTEAU. His gallery contained a fine collection of Italian paintings which revealed, as it were, a new world to the imaginative artist. It is believed that CROZAT employed him in decorating his house, but WATTEAU was already wearied with work of that class. He left his patron. Whether he made any resolution of trying to be independent is not known. He was more likely to have allowed himself to be treated as a puppet by destiny and to accept whatever turned up. The Academy offered a studentship in Rome, and WATTEAU tried the experiment of competing for the prize. The subject was scriptural, and his experience as an assistant in producing such works on the Pont Notre Dame was not likely to bring him success. However, he sent in two small pictures. They were so unlike the other competitive works, the Academicians were surprised by them. WATTEAU was informed that he was qualified to be an Academician without going to Rome, and if he cared to comply with the formalities he was assured there was no doubt of his election. He submitted, and it was in compliance with the conditions imposed that the beautiful *Embarquement* was executed.

The picture is, we consider, the most characteristic of the artist's works. It is remarkable for the same reason as some of TURNER's landscapes. The English painter, amidst the darkness and meanness of Maiden Lane and the garbage of Covent Garden, saw visions of beauty which are not surpassed by anything found on the earth's surface. WATTEAU, after a course of oppression, hunger, illness, poverty and general misery, created a scene which no idyllic, poetic or arcadian romance has approached. What is more, he compels the spectator to believe that, compared with the Cythera which awaits the travellers, the place from whence they are embarking is no more than a bleak and desolate shore. His privations caused WATTEAU, as a sort of reaction, to imagine youths and maidens of his own age who were the reverse of himself in health and strength and enjoyment of life. His sordid surroundings led to the creation of earthly paradises, surpassing all that fancy had attempted to describe. The lonely artist suggested on the canvas his own longings for love and companionship in a region where no middlemen could exist, and labour, if exercised, was only a pastime.

It was a most unacademical act to have brought WATTEAU into the Academy, but so much generosity is enough to condone many faults. The *Embarquement pour Cythère* is accordingly a memorial that even among Academicians exclusiveness can be sometimes broken down. The exceptional circumstances of his election drew attention to WATTEAU's merit and a demand arose for his pictures. He painted as many as he was able, and of a joyous class. If he could have settled down quietly he must have been happy, but the influence of his trials was not to be shaken off. Restlessness dominated him. He changed his abode from Paris to the country, and from the country to Paris; in desperation he came to England, but he could not abide for long in any place. At that time there was no cure for consumption, and WATTEAU's instinct made him feel that he was doomed. He died in July 1721, in his thirty-seventh year.

\* See Illustration.

Of late years a host of writers have descanted upon the works of WATTEAU. They all agree that he was original in his treatment of life. In no part of France could he behold such incidents as he depicted. It was then difficult to discover a landscape of any extent which did not exhibit some signs of human suffering. WATTEAU's swains are unconscious of what is taking place outside their parks. Life is to them all pleasure, and the seasons are always summer. He was therefore an idealist, although in his time the word related only to figures which bore more or less resemblance to ancient sculpture. The pictures might all have been painted by a man who was every day in the happiest mood, and they excite emotions of happiness in those who look on them. Their unaffectedness may be affectation, but there are few paintings which seem better adapted for enjoyment in a pessimistic age.

## ELECTRICAL INSTALLATIONS.\*

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Continued from last week.)

### SPECIAL PRECAUTIONS.

**Factories.**—Where inflammable goods are being manufactured or stored, and especially where inflammable material is floating in the air, such as in cotton mills, and also gunpowder magazines, &c., it is necessary that the following precautions be taken:—

Arc lamps as a rule must not be used, and certainly arc lamps without globes. For this kind of work the enclosed arc lamps now being introduced, in which the arc is maintained in an air-tight globe, are very suitable, and there is not much objection to them in cotton and such-like mills, but for explosive factories and even accumulator-rooms it is better not to permit any arc lamps of whatever construction. In workshops, and especially in carpenters' shops and any places where inflammable material is on the floors and benches, it is of the greatest importance that properly enclosed globes be used, and provided with a dish to catch any pieces of hot carbon which may be detached; this precaution must be insisted upon.

With reference to the use of incandescent lamps in mills and workshops, there are practically no special precautions to be taken. However, in accumulator-rooms, chemical works, and explosive factories and magazines, there are many points which need attention.

All fuses should be placed in positions where there are no explosive gases or materials near, and these should preferably be outside the dangerous rooms. If, however, the fuses have to be inside these rooms, they must be placed in an air-tight case, so that even if the room were full of an explosive gas and a fuse blows, no explosion would result. Switches must be air-tight or nearly so, and in chemical works it will be found advisable to discard brass lampholders and use the special oil-cup lamps which the best makers supply for such positions. In these lamps the connections are of the bottom loop type, and the holder is enclosed in a glass cup, which may be filled with some insulating compound or oil; by this means the bare copper connections and the brass-work are protected from the acids, &c.

Returning to gunpowder magazines, the lamps and connections must all be enclosed in perfectly air-tight fittings, no fuses may be allowed in the vicinity and the greatest care must be exercised that there shall be no possibility of arcing, or sparks of any description. The advice and assistance of an expert should always be obtained where work of this description is being carried out, as there are very many points which must be attended to in such installations, and they cannot all be enumerated in a small work.

**Breweries.**—In damp buildings, such as distilleries, breweries, laundries and paper mills, the difficulties are very great, and can only be properly grasped by experience. The chief difficulty is electrolytic action, and it is almost impossible to prevent it if ordinary wood casing is used.

There is much discussion as to the advisability of using continuous currents in such buildings, and there are many advantages in favour of alternating currents, not necessarily high tension. It is obvious that in an installation the positive cable will be attacked and corroded if there is the slightest leakage, the same chemical and electrical laws applying to this as to accumulators. The negative cable will, however, not be affected to any dangerous extent. Fires are caused by the corrosion of the positive wire in the following way:—The wire is corroded until the circuit becomes very bad, and the current is kept flowing through the copper hydroxide which is formed. This will be noticed by the lamps becoming dull and flickering, while neighbouring ones are bright. Finally, the heat evolved at this place of resistance dries the hydroxide and the casing, the result being that an arc is formed between the two ends of the wires. If the damp has disappeared in the interval the result is a fire.

These latter dangers can be avoided by frequent testing, and by the use of earth lamps, which are a continual indication of faults. It may be perhaps of interest to describe the earth lamp arrangement. Two lamps are connected in series across the mains, an earth wire being connected between the two. If the two wires are equally insulated from earth, the potential between the positive and the middle or earth connection will be the same as that between the negative and the earth connection, consequently the lamps, if of the same candle-power and voltage, will burn equally at half voltage. If one of the mains becomes earthed the lamp connected to it goes out and the other burns at full voltage.

This earth-lamp system only applies in cases where both mains are insulated. Care must be taken to disconnect the earth wire when testing the insulation, as it really earths both mains continuously and reduces the insulation resistance to that of the lamp resistance, *i.e.* a few hundred ohms; but this, of course, is no disadvantage, as the "fault" is a lamp and there is no danger.

There is no doubt that rubber is not good enough to resist wet and dry action in distilleries, and consequently it is important to discover a kind of wiring which will stand these conditions. If a separate plant is being laid down and there is no chance of public supply mains being laid near, an earthed outer concentric lead-covered system is perhaps the most suitable, but the fittings must be water-tight and perfectly enclosed. The fittings should not be taken on trust from any contractor, but samples should be submitted before the work is commenced, and an expert's opinion obtained before any tender is accepted.

The special fittings designed by inventors of numerous systems, and which are claimed to be water-tight and damp-proof, are unfortunately rarely if ever so, and usually collect the moisture.

There is an absolute necessity for lamps and holders to be enclosed in air-tight fittings, and ship fittings are as good as any where there are no acid fumes, &c., in the atmosphere. The outer lead covering should be soldered to the base of the fitting, so that no moisture can possibly enter, except from the front. The fittings inside must be damp-proof, so that moisture cannot get into the hygroscopic insulation, if used, and the outer glass cover may be clamped to an inside rubber ring in the usual way. A fitting put up as described does not cost much, if any, more than one carelessly designed, such as one which depended upon the glass front to keep moisture from the cable, or upon a red-lead joint at the back.

Fuses in damp positions give a great deal of trouble; the fuse wires are electrolysed by the current passing through the film of moisture on the porcelain base. Switches do not, as a rule, give much trouble, the only serious point being that metal handles become connected to the circuit through the moisture, and shocks result. It takes a long while for the switch contact blocks to become corroded very seriously, and when it does happen there is no danger of fire as with fittings, as the switch is, or should be, mounted on an incombustible base.

It is, however, advisable to arrange switches and fuses in air-tight metal boxes, and there will be no trouble with either.

If there is any probability of supply mains being laid, the system to be recommended should be the lead covered

\* In last week's article, page 169, last line but three, read:—"They usually have mercury commutators, &c.," instead of "They usually have mercury accumulators, &c."

either concentric or twin, with both conductors insulated, or an iron pipe drawing-in system may be adopted. Exactly the same precautions should be taken in either case. The lead covering or iron pipe should be connected to a metal box which is air-tight and surrounds the switches and fuses, and also connected to the base of fittings.

It is often found practicable to have the switches, fuses, &c., in a separate room which is dry. This is often possible in breweries and distilleries, and in this case the special precautions for fuses and switches may be omitted.

These special precautions do not necessarily mean an extra high cost, as they are most of them questions of design rather than of expense. Of course the greatest skilled supervision must be exercised over the workmen while work of this class is being carried on.

*Theatres.*—Precautions to insure that total failure of light shall not occur are most important where many people are congregated, such as in theatres, churches, public halls, railway stations, and also in places where articles of value are exhibited, and where temporary darkness might be made an opportunity for theft. A consulting engineer should always be employed to design, to supervise during construction, and to make periodical tests. This is insisted upon in the case of theatres and like buildings by the County Council regulations. If the current is obtained from public supply mains, the matter is a difficult one, as the failure of the mains or supply station has to be provided against.

If the supply is on the continuous current system a battery of accumulators always connected across the mains, with an automatic accumulator switch to prevent any return current from the battery to the mains, will effectually prevent failure of the light, and can be put up at a not very excessive cost. The accumulators will last almost an indefinite time, as they will very seldom be discharged, and they will not take any appreciable current to keep them charged. If alternating currents are used for incandescent lighting it is not hopeless to provide against failure of supply, as a battery of accumulators can be installed as before, and instead of an automatic accumulator switch, an automatic rock-over switch can be provided which will change the circuit from the alternating to the continuous current circuit. A small motor-transformer may be used to charge up the battery occasionally, say once in every two or three months. In either case the extra cost of working will not be more than a small fraction of the ordinary cost; in fact, the above method might be likened to the use of a cistern in a water supply, which is on the "constant" supply system, but which, as experience has shown, may fail temporarily.

Having shown how to prevent a total failure of the service, the next point is to prevent failure owing to fuses blowing, defective wiring, &c. If no accumulators are used there should be *more than one* main fuse, and this point must be insisted on; if the supply company's officials will fix only one main fuse, an application to the chief engineer explaining the circumstances, or, if he is obdurate, to the Board of Trade inspector, will remove this difficulty. There must be at least two principal fuses, whether accumulators are used or not.

The whole of the important parts of the building must be wired alternately on at least two entirely separate circuits on the two separate main fuses. In this case, if one main fuse blows half the lights will be on, and this will prevent anything like a panic, and with the present standard of illumination, hardly any serious inconvenience in consequence, the illumination being even then what would have been considered good ten years ago.

There should be as few branch fuses as will be allowed by the insurance companies, and if accumulators are used there should either be no fuse for them, or the one used should be very large.

The above principles may be summarised as follows:—

1. No single main fuse between the source and the whole of the lamps.

2. As many totally independent circuits (interlaced as much as possible) as can be arranged.

3. The use of accumulators to temporarily take the place of the source of supply if it fails.

If the above precautions are carried out there will be, if not absolute immunity from failure, such a very small

chance of failure that it may be neglected for any case which has up to the present arisen.

#### *Regulations.*

It may be advisable to enumerate the most important regulations made by the County Council for the protection of theatres and other licensed buildings from fire:—

Where the electric light is permitted in such premises, it shall be on condition that a competent electrical engineer do certify in writing to the satisfaction of the Council once in six months that the system is in perfect working order.

All such premises when lighted by the electric light shall have at least three distinct and separate circuits (*a*) for the stage, (*b*) and (*c*) for the auditorium, corridors and exits.

The circuits referred to in (*b*) and (*c*) shall be so arranged that half the lights in each division of the auditorium, and half those in each corridor and exit shall be on (*b*) and the other half on (*c*).

When the current is supplied by a public lighting company these circuits shall be taken separately from the street mains.

Under all circumstances complete metallic circuits must be employed.

Gas and water-pipes shall never form part of any circuit.

The number of lamps shall be so subdivided that no sub-circuit shall carry more than sixty-five amperes, and each sub-circuit shall start from a distributing-board.

All conductors shall be efficiently protected from mechanical injury.

Where conductors pass through walls, fireproof floors, or ceilings, they shall be protected by iron pipes or by glazed stoneware or porcelain tubes, and precautions shall be taken to prevent the possibility of fire or water passing along the course of the conductors.

All external conductors shall be specially insulated and laid in iron pipes properly jointed and of ample size.

Such iron pipes shall be protected where necessary, and securely fixed and supported when not underground.

Resistances for regulating the power of the lights shall be mounted on incombustible bases, and shall be so protected and placed at such a distance from any combustible material that no part of the resistance, if broken, can fall on such material.

Principal resistances shall be placed in a fireproof room reserved for the purpose.

Arc lamps shall not be used within buildings without special permission of the Council.

When they are used special precautions shall be taken to guard against danger from falling glass or incandescent particles of carbon.

All parts of the lamps, lanterns and fittings which are liable to be handled (except by the persons employed to trim them) shall be insulated.

When there is a stage special care shall be taken that all works in connection with the lighting of the stage are carried out in as substantial manner as possible.

No metal-work in connection with the circuits shall be exposed or so fixed or constructed as to be liable to cause a short circuit.

Lamps on battens, footlights, &c., shall be protected by stiff wire guards so arranged that no scenery or other inflammable material can come in contact with the lamps.

No readily combustible material shall be used in connection with any lamps on the stage in such a manner that it might come in contact with the lamps.

No soft or readily inflammable wood shall be used in connection with the lamps on the stage, and all wood shall be protected by unflammable material from the possibility of ignition by an arc between any two parts of the two conductors, or by heated particles from any conductor or part of a conductor which may connect together the two main conductors.

Where a number of lights, as in the footlights, battens, &c., are supplied under the control of one switch, and protected by one single or double-pole cut-out, as the case may be, the conductors shall be maintained throughout of such a section that they will be effectually protected by the cut-outs against heating.

The leads to the battens shall be specially guarded, particularly at the points where they join on to the battens;

and a sufficient length shall be allowed to prevent the leads receiving any injury through any movement of the battens.

The battens shall be suspended by at least three wire ropes attached to insulators on the battens.

On no account shall the same batten be adapted for both gas and electric light.

A switchboard containing all the necessary switches, cut-outs and other fittings for the control and regulation of the stage lighting shall be fixed in some convenient position overlooking the stage.

The board shall be inaccessible to all but the persons employed at such premises to work it.

Boilers, steam-engines, gas-engines and dynamos, when used for the supply of electricity to such premises, shall be placed in such positions as shall be sanctioned by the Council.

Gas-engines shall be placed in rooms so adequately and continuously ventilated that no explosive mixture of gas can accumulate by any leakage through the engine in the event of any of the gas-cocks being left turned on.

A hood, connected with a pipe carried into the external air, shall be fixed over the ignition tube when this is used.

Primary or secondary batteries shall be placed in rooms so adequately ventilated that no fan shall be necessary.

The batteries shall be well insulated.

Transformers used to transform either direct or alternating currents, together with the switches and cut-outs connected therewith, shall be placed in a fire and moisture-proof structure.

Where the primary current is of high potential, such structure should be preferably outside the building.

No part of such apparatus shall be accessible except to the persons in charge of its maintenance.

No transformer which under normal conditions of load heats above 130 deg. Fahr. shall be used.

Transformer circuits shall be so arranged that under no circumstances shall a contact between the primary and secondary coils lead an electromotive force of high pressure into the building. The term "high pressure" means in all cases pressure above 200 volts.

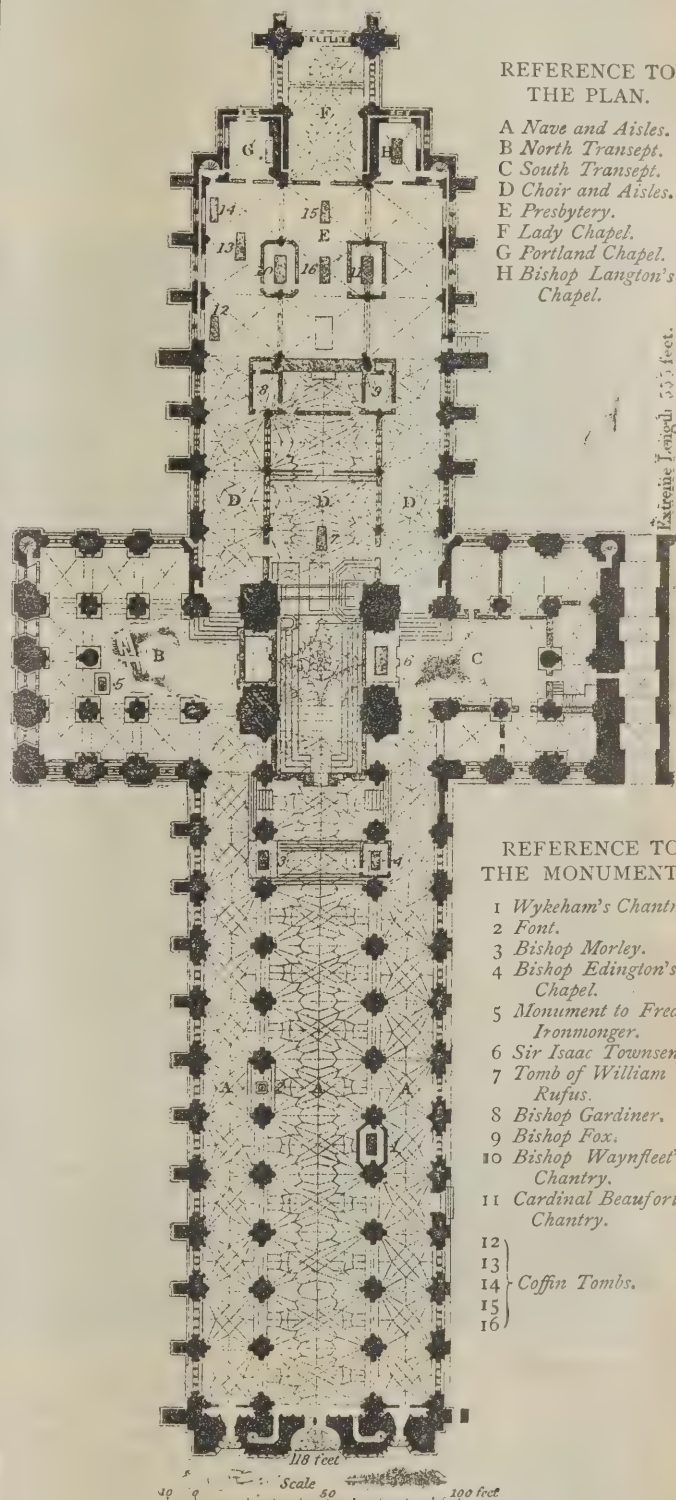

The generating plant and switching gear shall be in the hands of thoroughly competent manipulators, and the engine-room (if any) shall be inaccessible to the general public, and shall, where possible, have an independent entrance.

A plan of the wiring shall always be kept in a prominent position in the office of the manager of such premises.

#### WINCHESTER CATHEDRAL.—IV.

IN the preceding articles we have referred to several men and women of various ranks who were connected with the history of Winchester Cathedral. That course was inevitable. With the exception of Westminster Abbey there is no building in England which has so many personal associations around it. The peculiarity is further exemplified by the number and beauty of the chantries and chapels. Three of them are of exceptional interest, viz. WYKEHAM'S, WAYNEFLETE'S and BEAUFORT'S. They form a class of work which is of great interest. The designers were more exempt from restrictions than when erecting a church. They were able, therefore, to give a more free expression to their ideas of Gothic architecture. It will be seen from the views of the chantries that in every case there was a desire to express the soaring aspirations of the style. A pyramidal construction could not be employed, for a chantry was a miniature chapel, but all the lines may be described as upspringing and pinnacles abound. There is not the severity of the pyramid or the obelisk, but a chantry may be described as a collection of miniature examples of them. There was no suggestion of a prison-house, and although sanitarians may object to sepulchres in buildings, it could not be denied that in the chantries there was no lack of ventilation. In the style of workmanship the stone-cutter was emulous of the goldsmith. In such cases the character of the structure depended on financial considerations. It was allowable to suggest the greatness of the individual who was buried and the number of friends he believed he possessed in heaven. If funds were available a large number of statuettes of patron saints could be introduced. The history of a

family could be suggested by the aid of heraldry, and the virtues of the deceased could be indicated by means of paintings. It is remarkable that Gothic art was exhibited in chantries after it had almost ceased to appear in church buildings. The chapel of Bishop Fox, who died in 1528, is an example. It is introduced in the view of the south aisle of the choir, which we published on the 5th instant. The structure is shorn of the sculpture and other ornaments which imparted animation to it, but as it stands it

is a noteworthy example of English art. The following technical description of it is worth reprinting:—

In this magnificent sepulchral chapel every effort of ingenuity and skilful workmanship have been exerted to their utmost, and it unquestionably affords one of the most extraordinary examples of design and sculpture in existence. Four equal divisions compose the architectural design of the front, the elegance of which corresponds with the ornaments that enrich it. These divisions are formed by octagonal turrets rising from the pavement, and exceeding the height of the surmounting parapet, where they are larger and more decorated. Between these turrets and rising from the ornamental course below the parapet are smaller finials, each supporting a pelican in its

piety, an emblem of the Christian Church, and a favourite device of Bishop Fox. The height of the chapel is divided into storeys; the lower of solid masonry, enriched by a series of canopied niches and panelled compartments of elegant design and exquisite workmanship. In the westernmost division is the door of entrance to the chapel; and in the third division eastward, which projects a little on the basement, is an arched recess containing a sculptured effigy of the bishop, who is represented emaciated and clothed in a winding sheet. The divisions of the upper storey are composed of large arches, the spandrels are charged with pelicans, and the arches are subdivided into two open compartments by ornamental mullions, forming inner arches, terminated by crocketed finials. These are also divided into two openings, and in their height by embattled transoms. The surmounting cornice and its parapet are very elegant; the projecting course is enriched by a very beautifully designed and sculptured band of entwined vine leaves, with tendrils and fruit delicately undercut, and marked with the initial letters

Nor is the interior of this chapel less beautiful or deserving of notice than the exterior, although less enriched. The chapel is ascended by several steps through a doorway in the first division from the western angle; the roof is in an almost infinite variety of compartments, divided and subdivided, and connected by knots of leaves, and having various enrichments. The niches at the eastern end of the chapel are as delicate and beautiful as ingenuity could make them, and the internal parts of the canopies rival anything of their kind."

Cardinal BEAUFORT's Chantry, which is shown on the same plate, No. 15, is of simpler character. Bishop Fox was a lover of sculptured figures, and we suppose he had arranged that several of them were to be introduced in his chapel. The Cardinal may have cared as little about "stone dolls" as Sir ISAAC NEWTON, and consequently they were mainly introduced in the upper part of the structure. One of the consequences is that the BEAUFORT

Photographed by S. B. Bolas & Co.]

WINCHESTER CATHEDRAL, NORTH AISLE.

"H. W." in one part. The parapet is composed of lozenge-shaped compartments, enclosing quatrefoils in open work, and terminated by large and small leaves alternately disposed on the summit. Between the octagonal turrets and the outer mouldings of the arches or windows of the upper storey are canopied niches, which, together with those on the lower storey, make the whole number of niches which originally contained statues thirty-eight; their canopies are nearly alike, the difference being only in the detail of the ornaments. The pedestals intended to sustain the figures are remarkably elegant, particularly those rising from the base of the chapel. Mr. Buckler, an architect of established reputation, whose judgment may be relied on, in a description of this chantry says:—"On the most scrupulous examination of the smallest part or ornament, whether a canopy, a crocket, or the smallest moulding, the character and precision are equally the same. The roof of every canopy differs in design, as also the animals in their positions, which are attached to the arches.

Chantry to-day appears more complete than its neighbour. It has also, we consider, more claim to be considered as a perfect example of architecture, for it is a monument rather than an enclosure. The name of BEAUFORT was identified in the popular imagination with "a monstrous life," and when opportunity offered the chantry suffered, for we are told that "the extent of the violence upon the more delicate enrichments of this superb monument has been such as to leave not a single niche and scarcely one pinnacle entire." Bishop WAYNEFLETE's Chantry is opposite BEAUFORT's, and the two so nearly correspond they suggest they were executed about the same time and by the same artists.

WYKEHAM's Chapel is rightly placed in the nave, in one of the bays on the southern side. There are three arches facing the nave which are treated with much delicacy. Over the monument, within the enclosure, are niches which

once were filled with figures. But a costly monument was hardly needed for so famous a man, whose name will be always associated with the cathedral.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. Aston Webb presiding. The minutes of the last meeting having been circulated, were taken as read. The following is an abstract of Mr. W. H. St. John Hope's paper on

### Heraldry in English Mediæval Architecture.

He said he should confine himself to the historical period beginning with the accession of Henry III. in 1216, and ending with the death of Henry VIII. in 1547. The applications of heraldry to architecture in this period were so numerous that it was not easy to deal with them in any degree of connection. Arms, badges, crests and supporters were freely used in every conceivable way and on every reasonable place. Whether the building were ecclesiastical, domestic or secular was immaterial; there was no difference in the treatment of the heraldry nor limitation of its use. The earliest applications of armorial insignia were purely of a personal character, to distinguish a man from his fellows when all were alike disguised in their war harness. These insignia usually took the form of a device painted upon the wearer's shield or attached to his headpiece. Heraldry, consequently, is met with first in buildings, in the form of painted or sculptured shields on the monumental effigies of departed warriors.

The value of armorial shields as a mode of picture-writing soon suggested itself when heraldry became a science, and the association of them with architecture formed at once a beautiful form of decoration and a speaking historical record. The wall arcades of the nave aisles and the tombs of Queen Eleanor and William de Valence in the abbey church of Westminster furnish the earliest and most charming examples of this combination.

Another admirable thirteenth-century example is the gatehouse of Kirkham Priory, Yorkshire. In the new nave of York Minster, of about the same period, various benefactors to the church are commemorated, after the Westminster fashion, by their shields of arms, thirty-two in all, sculptured, two to a bay, in the spandrels of the pier arches. A somewhat similar arrangement occurs at St. Albans in the beautiful decorated bays of the nave, built after the partial fall of the south side in 1323. In the North of England there were numerous fourteenth-century buildings showing heraldic decoration with the architecture—for instance, Bothal Castle, Alnwick Castle, Hilton Castle, co. Durham, Lumley Castle, the Lion Tower at Warkworth, and Micklegate Bar, York. The presbytery and choir of York Minster contain in the spandrels of the pier arches a series of sculptured shields similar to those in the nave, and the great arches of the central lantern tower are also adorned with large and fine examples of the sculptured shields of arms of the builders and others. Taken as a whole, the fourteenth century, except perhaps in Yorkshire, was not very prolific in buildings decorated with heraldry; but it produced a magnificent series of monuments, many of so elaborate a character as to form distinct features of the churches wherein they stand. The more notable examples were enumerated and illustrated by the author of the paper.

The so-called Perpendicular style was very prolific in heraldic ornament and decoration, which was especially seen in East Anglia, where almost every large church of the period is lavishly decorated with heraldry. Several examples were described. Fine displays of heraldry existed in many of the ornate fireplaces of the fifteenth century, notably at Tattershall, in Lincolnshire, and the bishop's palace at Exeter.

The fifteenth century, like the fourteenth, was rich in heraldic monuments, and brought into fashion those beautiful stone structures that combine the monument with the chantry chapel, of which examples exist at Tewkesbury, St. Albans, Salisbury, Winchester, and elsewhere, one of the finest in design, as it is most remarkable in construction, being the bridge-like structure in Westminster Abbey church, in memory of Henry V., whose tomb stands beneath it.

Much of the architectural heraldry of the first part of the sixteenth century is simply a continuation of that which preceded it. In large and costly buildings, however, the increased richness of the architecture was accompanied by a corresponding outburst of heraldic display, as in Henry VII.'s Chapel at Westminster (in particular the bronze doors), King's College Chapel, Cambridge, St. George's Chapel, Windsor, and Hampton Court.

Selecting a few typical architectural features, such as spandrels, bosses of vaults, &c., Mr. Hope proceeded to show the influence the introduction of heraldry had had upon their ultimate development, citing numerous existing examples. In

conclusion, the author discussed, by the light of Mediæval examples, the artistic treatment of heraldry in its application to architecture, shields, crests, supporters and various other features being dealt with in detail. The lecture was illustrated by a large number of lantern slides and coloured photographs of stall-plates of Knights of the Garter in St. George's Chapel at Windsor.

Mr. J. A. Gotch said he had been asked to propose a vote of thanks, but in order to do that properly he should be well versed in heraldry, and this he could not boast to be. He was struck by the interesting series of views, but the later examples pleased him more than the earlier ones. The earlier were more heraldic and simpler, but from a decorative point of view the later ones were better and the art of the designer was more clearly shown. If he criticised he would venture to say that the badges in the Tudor period appeared coarse; perhaps this was because the finest designers never stuck to the highest form of decoration. There was one thing which could be gathered from the examples, and that was the great advantage of studying heraldry in the round as well as in the flat. By having to model a shield, and not merely to draw it, one became better acquainted with its construction and how the various things which the shield bore were logically placed. Freedom in heraldry was a thing which modern designers ought to consider—freedom both in drawing and the shape of the shield. Considering the origin of heraldry, it was curious that ladies should have indulged in heraldic bearings; but perhaps when it took a line not only useful but decorative, the ladies saw their advantage and stepped in. It was the custom in Spain for unmarried girls to display a shield, one half of which bore the maternal arms, the other half being blank, so that the husband inserted his arms and a new insignia was formed. This shield carried by the girls was called the shield of expectancy. Architects must have found heraldry very useful, as it told the history of a building, and was very often the only way of finding out dates.

Mr. J. J. Stevenson, who seconded the vote of thanks, said the paper was a treat, because of the knowledge and precision of statement that it showed. Heraldry made them feel how poverty-stricken they were, not being able to do the like. Heraldry, he thought, was as old as the race; it must have been before letters, and it was one way of writing names. He could not understand why it should be considered assuming or bumptious to set up the arms of one's family. If a man had a right to a crest why should he not employ it? The crest expressed the totem notion of relation or resemblance to a particular animal, and hence the bear or the leopard was once largely used in England. But if heraldic signs served instead of signatures in days when few could write, it seemed anomalous that now there should be a tax on similar signs.

Mr. Hugh Stannus said he also found hesitation in adopting heraldic signs. Heraldry served two purposes. It was an indication to identity and was a decoration. It was also connected with storiography and was a clue to dates, but it should be properly treated, and early examples on that account deserve to be respected, although some later examples might be no less efficient and artistic. Heraldry should be subordinate to architecture, but that would not diminish its true value.

Mr. J. D. Crace warned the members against the danger of freedom, for there was more precision about the principles of the science than was commonly supposed. As an example of what could be done by its aid, he referred to the beautiful gates between the House of Lords and the lobby. The work suggested that, if the conditions were favourable, the modern treatment could compare with Mediæval examples.

Mr. Aston Webb, in putting the vote, expressed satisfaction that so many specialists were present, and if any improvement was feasible they might expect it from those gentlemen. Referring to modern examples, they should not forget what had been done by Pugin.

Mr. St. John Hope, in returning thanks, said he had assumed that all who had listened to him would have mastered the elements of heraldry. He then dealt with some of the objections raised during the discussion. He agreed with the Chairman about the merits of Pugin, who was most dexterous in the representation of heraldic beasts in the traditional style.

It was announced that Mr. J. Alfred Gotch would read a paper at the next meeting, March 29, on "Heraldry of the Renaissance in England."

**The Decree** providing for the repair of the battlements of St. Mary's Church, Oxford, in accordance with Mr. Jackson's designs at a cost not exceeding 1,750*l.*, which was approved by Congregation, was opposed on Wednesday in Convocation by Mr. Park Harrison, who objected to any departure from the designs of Sir Gilbert Scott. Professor Case deprecated further opposition, Mr. Jackson's treatment of the repairs having been on the whole most careful and judicious. The decree passed without division.

## NOTES AND COMMENTS.

ONCE upon a time there was no building in Ireland which attracted more attention than the Conciliation Hall on Burgh Quay, in Dublin. It was not a remarkable example of Irish architectural skill, but in it O'CONNELL ruled for several years, and fulminated weekly against all whom he considered to be his enemies. There, too, the Young Ireland party arose against the great agitator, because he despised the sword and declared that repeal itself was not worth a little bloodshed. In the hall his last speeches were delivered without attracting much notice from the people. After the death of O'CONNELL, and the downfall of the movement which, by means of subscriptions of a shilling a year from members, was to overcome England, the hall ceased to be a forum, and was easily converted into a corn store. Now it is about to be subjected to another transformation. Plans have been prepared by Mr. W. H. BYRNE, of Dublin, which will be carried out by August next at a cost of over 20,000*l.*, and then the Conciliation Hall will appear as the Grand Lyric Hall. There was not much harmony inside it in its political days, and we hope compensation for all the old discords will be found hereafter. What a blessing it would be if other political institutions in Ireland could be as readily adapted for promoting the "concord of sweet sounds."

THE Royal Society of Antiquaries of Ireland is the successor and development of a society which was founded in Kilkenny about half a century ago. As such it rendered more service to archæology than was possible for the parent society. We apply the past tense, for the Royal Society of Antiquaries now seems to be in a condition of decline, although we do not suppose its condition is hopeless. Before the amalgamation took place a valuable collection of antiquities was gathered in Kilkenny, and there it still remains. The capital of the BUTLERS is the most fitting place for it, as it represents largely local archæology, and would never have existed without the zeal of local members. The majority of the members of the Royal Society will talk and display themselves freely, but apparently collecting is too humble a task for orators. Yet an antiquarian society without some sort of a collection is an absurdity. Accordingly, longing eyes have been cast on the objects in Kilkenny. We can understand there is another motive for the desire to dispossess Kilkenny of the property. So long as there is a museum of antiquities in that city, it would form a sort of nucleus for a new society in case of a split among the members of the Royal Society of Antiquaries of Ireland. It is well to remark that if the collection were handed over next week the society could not undertake charge of it, having no premises to shelter so many objects. The scheme at present is therefore to operate on the acquisitiveness of the Science and Art Department by representing that the Dublin Museum is incomplete so long as a fragment of an Irish capital remains in Kilkenny. The Department is not, however, adverse to the creation of local museums in England, and similar toleration should be exercised in Ireland, where much havoc is caused because there is not enough interest taken in archæology by country folks. It cannot be said the collection suffers in Kilkenny, and as it has been preserved during so many years there is no ground for doubting about its safety hereafter. If the Department will not allow itself to be duped into becoming a catspaw for a clique, there is no likelihood of a removal to Dublin of what was gathered mainly by Kilkenny men, and which they are eager to treasure.

THE peculiarity of the Scottish law in dealing with parish churches received a curious illustration in a case which was tried before the Court of Session on Friday last. In October 1892 it was decreed by the Presbytery that the parish church of Kinghorn was in such a condition as to be beyond repair, and that a new building should be erected. By an arrangement which was made in 1761 the burgh of Kinghorn is to pay one-half of the expense of all repairs of the church on condition of having one-half of the area assigned for use of the burghers. If a new building were to be erected that arrangement would not be valid. Accordingly the heritors, who feared they might have to

bear the greater part, if not the whole, of the burden of a new church, lodged an appeal. An architect was called in, who declared the building to be repairable. The work was carried out accordingly, and cost 2,889*l.*, or within 600*l.* of the cost of a new building. The question then arose, who was to pay so large an amount, especially as the order of the Presbytery was not obeyed? The burgh would have escaped liability if a new church was erected, and it was contended that the altered building was equivalent to one. But their lordships held that, however much of the building had been taken down and replaced, it must still be considered to be the very same church which was the subject of the arrangement in 1761. The burgh will therefore have to pay one-half and the heritors one-half the cost. It is worth remarking that if the work comprised any enlargement the heritors would have escaped payment, and it is difficult to say who would then be liable.

AN investigation of the effect of the tornado in St. Louis was undertaken by Mr. JULIUS BAIER, and he has presented the results to the American Society of Civil Engineers. Among his conclusions are the following:—  
1. That for any twisting, wrenching or bending strain a  $\frac{3}{4}$ -inch rivet is far superior to the ordinary  $\frac{3}{4}$ -inch bolt. 2. That the tension value of three  $\frac{3}{4}$ -inch steel rivets is sufficient to distort the web of a 15-inch 41-lb. I-beam  $\frac{1}{8}$  inch out of line without failure of the rivets, and is also far in excess of the bending resistance of the metal in a  $\frac{7}{16}$ -inch connecting angle. 3. That a tension strain transmitted across the root of an angle from one leg to the other will cause a bending and a distortion of the angle, and bring an eccentric tension strain on the nearest line of bolts or rivets, and that under such action, in an angle as light as  $\frac{7}{16}$ -inch, the second row of rivets will not act till the first row has failed. 4. That an eccentric tension strain will readily cause a bolt to fail by bending or breaking in the thread while the steel rivet will stand considerable distortion without failure. 5. That well-riveted joints in steelwork will stand, even under jar and shock, an excessive amount of abuse and distortion before actually separating into individual pieces. Mr. BAIER considers that the safety and interests of the community and of the owner of the building require a recognition of a wind-pressure of at least 30 lb. per square foot against the exposed surface of the building, with an additional local provision of 50 lb. for several storeys near the top; and that this amount should be safely taken care of by some positive and definite provision in the construction of the frame.

RAILWAY companies have a knack of evading liabilities, especially when dealing with property which does not belong to a person of influence, and in too many cases, owing to the fear of the consequences of contending with them, the companies contrive to be successful. An attempt of the kind on the part of the Caledonian Railway Company has met with failure and may be a lesson to other companies. An Act was obtained for an extension of the Caledonian system in Leith. On the Parliamentary plans and in the reference book a warehouse, courtyard and approach to street belonging to a Mr. TURCAN were shown which formed one property. But when the notices for purchase under the Lands Clauses Act were sent to him, only the approach was described as being required. The owner would therefore be left in possession of a warehouse which he could not enter or, if he somehow gained admission, could not depart from it. The arbitrator would not regard the case through the Company's spectacles and decided that as the approach could not be severed from the rest of the property the sum to be paid must be 10,000*l.* The Company then offered to make an approach to the warehouse beneath their line, and if that proposition was made at first there can be little doubt that Parliament would have approved of it. But the owner would not agree and the case was taken to the Appeal Court. Their lordships, however, upheld the award, one of the reasons being that it was doubtful whether the directors of a railway company could bind their successors in so simple a matter as the keeping open of an accommodation bridge.

## GREAT SCREEN, WINCHESTER CATHEDRAL.

IN the illustration of the chancel already published the screen has appeared, but the work of Bishop Fox is too important to be treated incidentally. The central figure of CHRIST has yet to be introduced, but the statues which fill the niches are a credit not only to the munificence of lovers of ecclesiastical art, but to the liberalism of the cathedral authorities. The sculpture has not exercised, so far as is known, any baneful influence on congregations. BENJAMIN WEST'S altar-piece is out of place amidst so much sculpture, and some day, it is to be hoped, a more suitable example of decoration will be introduced.

## PICTURE GALLERY, STAFFORD HOUSE.

THE exterior of Stafford House, as seen from the court hardly suggests the grandeur of its principal rooms. In that way it is characteristic of an English peculiarity. The interior was completely altered according to the plans of Sir CHARLES BARRY, and suggests his skill in dealing with Italian forms. There is no mansion in London which is better adapted for a patrician residence. The pictures are also little known to those who visit winter exhibitions. But among them are works by RAPHAEL, TITIAN, TINTORET, GUIDO, PARMEGIANO, MURILLO, RUBENS, VANDYKE, TENIERS, TERBURG. There are no less than five of WATTEAU'S paintings. Modern art is represented by examples of WILKIE, LAWRENCE, LANDSEER, ETTY, PAUL DELAROCHE, &c. The building was originally erected for the Duke of YORK, the second son of GEORGE III., who never inhabited it. In 1841 the lease was purchased by the then Duke of SUTHERLAND for 72,000*l.*, and the whole of the money was applied to the formation of Victoria Park. BARRY was commissioned to adapt the building to modern requirements. An upper storey was added, and among the new works was the fine gallery now illustrated.

## THE EMBARKMENT FOR THE ISLE OF CYTHERA.

See article, page 184.

## ROYAL INSTITUTE OF PAINTERS IN WATER COLOURS.

THE galleries of the Royal Institute of Painters in Water Colours are the most hospitable in London, for the members' works are always in a minority. In no other place in England is there a better opportunity of judging the progress of art in one direction. Everything that is to be seen is not the work of a practised artist, but on that account we can gauge the possibilities of the future. This year there are some novelties which we may ascribe to French influence, but on the whole we see a respect for English traditions. One great advantage of the Piccadilly exhibition is that we have finer colour drawings of the figure than elsewhere, although in landscape the Pall Mall galleries are superior.

In this exhibition the whole of a gallery has been assigned to drawings which have been presented as prizes for the Institute Art Union. The object in view is to relieve the members of some of the debt which was incurred when the galleries were erected. If we remember the generous way in which wall space has been appropriated to outsiders, the claims of the Institute Art Union on public support can hardly be ignored. The works which are available for distribution are excellent. No words are required to recommend a collection to which Turner, Muller, Holland, Varley, Prout, Cotman, Bonington, Copley, Fielding and other masters of water colour art have contributed, besides many modern artists. The object in view is not altogether personal, for the Institute has earned the support of the public.

The President this year has another Shakespearean character on a large scale. *Rosalind* is probably a portrait. In character it differs from the types adopted by other painters, and if it is not the ideal *Rosalind*, it is suggestive of the poet's description. Near it is Mr. Kilburn's *The Lady June*, which may be considered too pretty to suit some tastes, but is such a piece of work as few artists could rival in water-colours. Mr. Sheridan Knowles's *Silvia* is another vigorous single figure. If we may judge from what is said by young lady critics, the *St. Genevieve* of Mr. T. Austin Brown will not be popular, but those who condemn it are forced to linger in front of it. It shows the shepherd girl with a flock of sheep, and under the subjection of some influence that is, not visible. *The Picture*

*Book*, by Mr. C. A. Smith, two girls reading a book in an old-fashioned cottage, is simple, but displays a fine sense of beauty in contrast. Mr. H. R. Steer has become a rival of Mr. C. Green as an illustrator of Dickens. *Nicholas Nickleby interposes on Smike's behalf* is successful as a representation of the incident, but the schoolmaster's wife does not correspond with the ordinary ideal. *Come unto Me, ye weary*, the only work of Mr. W. W. Collins, showing a woman at the foot of a crucifix, with a visionary Christ approaching her, is novel, and difficulties have been skilfully overcome. In *Sword and Pen*, by Mr. F. W. Davis, Cromwell and Milton are in co-operation. The figures are characteristic, and drawn with power. The small drawing, *Girl in Hat and Feathers*, by Miss Kate Greenaway, has all the artist's old dexterity. Military subjects are now in fashion. Mr. W. B. Wollen's *Drummers*, from its colour and drawing, is about the most effective work in the exhibition. *The Highland Cattle Fair*, by Mr. C. J. Adams, which is above it, deserves a better position. Mr. J. C. Dolman's *Dogma*, three clergymen engaged in an after-dinner controversy, has one face which will bear comparison with Mr. Wilmot's in Mulready's *Whistonian Controversy*. Mr. Henry Ryland's *La Penserosa* is another capital drawing. Mr. Ernest Breun's *Brown Study* is skilfully treated.

There is great variety among the landscapes. Mr. Nisbet's *A Dark Moorland* is impressive. We hope Mr. Orrock is not becoming pessimistic. His *Old Mill in Essex* would recall Constable if it were not for the blackness that is mixed with his greens. On the other hand, Mr. Yeend King's *In Dovedale* shows greens in the trees, which are greener than ever, but it is a pleasant drawing to consider when the day is dull. Mr. John F. Fulleylove's *Acropolis and Temple of Olympian Zeus* recalls not only the ruins but the sky and olive trees of Athens. If Mr. C. E. Johnson's *Valley of Gloom* presented a few examples of architecture, it might also suggest heroic times. Mr. Cotman's *Away!* gives a glimpse of the sea, and the figure of the girl justifies the title. Mr. Arthur Severn is always ambitious, and his *Storm clearing off*, in which a rainbow is introduced, seems a true record of atmospheric effects. Mr. Bernard Evans has been impressed with the architectural beauty of *Fountains Abbey*, and delineates it with a fidelity which we are afraid will not satisfy the crowd. Mr. Wimperis has seven drawings, all records of open-air painting. He is one of the few artists who can suggest the appearance of English downs.

Among the street scenes may be noted Mr. Macquoid's *Market Place at Goslar*, Mr. Haité's *In the Street*, and Mr. Tyndale's *Market at Dar el Beida*.

## THE FIRST ROYAL EXCHANGE.

By ALFRED J. GLASSPOOL.

MR. J. G. WHITE, deputy alderman of the Ward of Walbrook, has recently written a most interesting little volume, entitled the "History of the Three Royal Exchanges."\* It deals not only with the first Royal Exchange, the gift of Sir Thomas Gresham, but also with Gresham's other gifts to the citizens—the founding of the Gresham Lectures and the building and endowment of the homes for decayed citizens, known as the Gresham Almshouses, at Brixton.

Mr. Deputy White's position as chairman of the City Side of the Gresham committee has enabled him to present to the reader many important facts in connection with Sir Thomas Gresham's good deeds, which are both valuable and instructive to the architect, the antiquary, and the ordinary citizen.

Seldom has any building had a more unique history than the Royal Exchange. Thrice opened by the reigning sovereign, twice burned to the ground, it has risen each time out of its ashes a more glorious building than its predecessor. At the present day it presents an imposing appearance on one of the finest sites of the Metropolis, and we may believe that the decorations now proceeding in its interior will in time make it bear on its walls some of the grandest specimens of the painter's art which the nineteenth century has produced.

We have to go back over three hundred and thirty-three years to January 4, 1564, when in the Aldermen's Chamber at Guildhall Sir Thomas Gresham offered to build at his own cost "a comely burse for merchants to assemble upon," on condition that the City authorities provided a suitable site. The offer at once met with approbation, for many of the aldermen—merchants of the City themselves—had experienced the want of such a building. Three aldermen and four liverymen were deputed to consider the offer, to view sites, and to report to the Lord Mayor and the aldermen on the very next Sunday at eight o'clock in the morning, "at the chapel in St. Paul's Church" wherein they do usually assemble before the sermon time."

\* *History of the Three Royal Exchanges.* By Mr. Deputy J. G. White. Effingham Wilson.

These quotations which Mr. Deputy White presents to us show us far better than any amount of words the simplicity of the days that are past. Then the aldermen lived in the City, they rose early, they attended forenoon service at church, and they did not scruple to discuss their municipal duties on a day devoted principally to religious exercises. The Corporation of London has from time immemorial had a part of London's cathedral devoted to its use. At the present day the Lord Mayor has his vestry, and the Corporation contribute its share to the cathedral expenses by paying the fees of the morning preachers.

The western end of Cornhill was selected as the site for the Exchange, and the aldermen at once set themselves seriously to the task. Eighty houses were removed, and in less than two and a half years, on June 11, 1566, the land was formally handed over to Sir Thomas Gresham, who laid the first stone of the building. The ground was not obtained without a considerable amount of opposition, and, as usual, many attempts were made to obtain unfair compensation for forced removals. Contributions towards the expenses were obtained from the livery companies, the chief citizens, the Worshipful Company of Merchant Adventurers in parts beyond the sea, and in the end it was found that the cost of the land was 2,208*l.* 6*s.* 8*d.*, for the leases 1,222*l.* 14*s.*, and for legal expenses 101*l.* 16*s.* 6*d.*, making a total of 3,532*l.* 17*s.* 2*d.*

When the Lord Mayor, the aldermen, and the Sheriffs with all the pomp of civic state, went in procession to the laying of the first stone a very different sight then met their view to that presented in modern days. No spectators from the Mansion House or Bank of England gazed upon the scene. The Mansion House was not erected till 1753, George Dance the elder being the architect. The site upon which it stands was in 1566 a market for the sale of meat and fish known as the Stocks Market. The site of the Bank of England was then occupied by the church and nearly all the parish of St. Christopher-le-Stock, its churchyard now being known as "the garden." The Bank did not commence operations till January 1, 1695, and then it occupied part of Grocers' Hall. The foundation-stone of the present building was not laid till August 1, 1732, and the business removed to its new home on June 5, 1734.

A glance at William Nelkton's Map of London in the reign of Edward VI. shows us that many of the chief streets still retain their ancient names. Cheapside, or Cheapling, as it was named, still joined on to the Poultry and ran westward; running out of it on the north we find Lawrence Lane and Ironmonger Lane, leading to the Guildhall. Threadneedle Street and Lombard Street occupy the site of modern days, Bucklersbury is there also, and Birchover Lane tells us of the future Birchin Lane, and that running stream the Wallbrook is an actuality, taking its rise from a spring on the Moor, or Moorfields, not far from our modern Old Street. Here in winter time was splendid skating; here the spring sent forth its sparkling waters, and meandered on its way across the Poultry, till at last it emptied itself into the then silvery Thames, from which anglers were able to draw the finest fish.

Cornhill was a popular spot. In it stood the Tun, so named from it being like a tunnel standing on one end, and being originally used for a cage or prison, in which bakers who gave short weight and others were exhibited to the popular gaze. This was afterwards converted into a conduit for sweet water, boarded over, and a stocks and pillory erected; it was here that the infamous Titus Oates received part of his punishment.

London was then a quiet city compared to the bustle and noise of modern days. Barbican, Aldersgate Street and the Minories were then as far removed from the actual business part of the City as Grosvenor Square, Park Lane and Piccadilly are at the present day. The trade of London was looking up; the Hanseatic League suffered by the rise of commerce in the Low Countries; Edward III. had encouraged commercial relations with our neighbours; we exported wool and imported Flemish manufactures and French wines, for beer was then unknown; the Wars of the Roses, though they devastated many of the flower of England's nobility, did not stop trade entirely. Under Henry VII. trade began to revive; Henry VIII. spent lavishly the money his father had saved; religious quarrels under Edward VI. and Mary had put a damper on commercial enterprise; but under the Virgin Queen a new vigour took hold of the nation, distrust passed away, and our merchants went abroad, foreign merchants came to our shores, and there was a general revival of prosperity.

It was no doubt these visits to the commercial cities of Italy, Germany and the Netherlands that gave to several public men the idea of erecting a building where merchants could meet; for happily in England the people are anxious to do for themselves what in foreign countries the governments undertake to carry out. The necessity for such a building was apparent to all. Stow tells us that the merchants met in Lombard Street. He says, "The merchants and tradesmen, as well English as strangers, for the general making of bargains, contracts and commerce, did usually meet twice a day," at noon

and in the evening, "but their meetings were unpleasant and troublesome by reason of walking and talking in an open narrow street, being there constrained to endure all the extremities of the weather, viz. heat and cold, snow and rain, or else to shelter them in shops." No doubt the disturbed merchants had often taken shelter in Sir Thomas Gresham's shop, which was situated in Lombard Street, facing the present post office; we may reasonably suppose also that the want of an Exchange was partly the cause of those disorderly scenes in old St. Paul's, where trade was carried on in sight of the very altar.

It was at this juncture, when Elizabeth was firmly established, having been queen for nearly six years, that Sir Thomas Gresham came forward to build a home for his brother merchants. Who was this generous trader? It is recorded that the Greshams derived their name from the village of Gresham, in Norfolk. Here a certain James Gresham was the father of four sons; the two youngest, Richard and John, were knighted by Henry VIII. Sir Richard was the father of Thomas; he was apprenticed to his uncle John, who was the king's agent in Flanders, and very soon proved himself an apt pupil. His abilities were so much appreciated, that in 1551 he followed his uncle's footsteps and became king's factor and king's merchant in Flanders, and went to live in Antwerp. He traded in wood, salt, silk, precious metals and diamonds; he served his country by deception, at one time exporting from the Netherlands 2,000 lbs. of gunpowder as "one piece of velvet."

He served King Edward VI. so well that, by skilful arrangement of the currency of his adopted home, he was able to pay off 108,000*l.* of the king's debts. Queen Elizabeth so appreciated him that she visited him at Mayfield, Sussex, 1573, and at the manor of Heston in 1576. It was on the latter occasion that the Queen expressed her opinion that the courtyard was too large; the next morning she was astonished to find the court divided by a wall: Gresham had employed a number of workmen during the night to erect the wall, but so quietly was the work carried out that the Queen knew nothing of what was going on.

Gresham employed Henrich, a Fleming, to design and construct the Exchange. It was a close imitation of the bourse at Antwerp; it was from Flanders that the stone, slates, iron and glass came. Flemish workmen were also employed, for the Court of Aldermen had given permission that "strangers" might be employed.

The Exchange had a frontage to Cornhill of 210 feet. There were piazzas round the interior, supported by marble pillars, opening into an inner court or quadrangle, which was not covered in. Above the inner panelling, within the arcade, were sculptures of river gods. In niches within the quadrangle, and immediately above the cloister in the covered walk, stood the statues of the kings and queens from Edward the Confessor to Queen Elizabeth.

The principal feature of the exterior view was a lofty square bell tower with two balconied galleries; on the top was a ball, with Gresham's sign, the grasshopper, surmounting the whole; from this tower the merchants were called to 'Change at 12 at noon and at 6 in the evening.

It was on January 23, 1571, that Queen Elizabeth visited the building, naming it the Royal Exchange and knighting the donor at the same time.

Sir Thomas was only destined to carry his honours for a short time, for on November 20, 1579, as Hollinshed says, "Coming from the Exchange to his house, a very short distance (Broad Street), between 6 and 7 o'clock in the evening, he fell down in his kitchen, and being taken up was found speechless, and presently dead."

The interior of the Exchange must have presented a very animated and picturesque appearance. In it could be found merchants from every trading nation: the English merchants wearing large puffed breeches, long vests, short cloaks and ruffs; the Fleming with his fur-trimmed coat and tight-fitting pantaloons; among these mixed the lowly Venetians wearing their long robes and elegant caps; and besides these at times were seen not a few courtiers from the palace dressed in all the glory of the period.

If we may take the words of the Rev. Samuel Rolle, who wrote 110 discourses, "Meditations and Contemplations on the Great Fire," in a literal sense, the Royal Exchange in after years was one of the wonders of the age. His words were:—"How full of riches was the Royal Exchange! rich men in the midst of it, rich goods above and beneath! There men walked on the top of a wealthy mine; consider what Eastern treasures, costly spices and suchlike things were laid up in the bowels (I mean the cellars) of that place. As for the upper part of it, was it not a great store-house where the nobility and gentry of England were furnished with most of those costly things wherewith they might adorn either their closets or themselves. Here if anywhere might a man have seen the glory of the world in a moment."

Notwithstanding all this flowery language, the Exchange became a place of unenviable notoriety. "Boys and young rogues" made such noises that elder people could not "hear themselves speak"; men sold rats and dogs; the cursing and

swearing of both men and women were terrible to hear; bulls and bears were paraded to advertise the amusements provided at Bankside, perhaps, indeed, to make known the play at the Globe Theatre, in which Shakespeare was taking a part.

Just as the loungers in St. Paul's were said to dine with Duke Humphrey, so the idlers at the Exchange were said to sup with Sir Thomas Gresham. This idea was expressed by Hayman in 1628 in his address to Sir Pierce Penniless:—

Though little coin thy purseless pockets line,  
Yet with great company thou'st taken up,  
For oft with Duke Humphrey thou dost dine,  
And often, with Sir Thomas Gresham sup.

The Flemish workmen had, however, not done their work in a very substantial manner; in ten years very serious defects were found in the building. The "Inquest Book" of Cornhill Ward of 1581 informs us that the keystone of some of the arches was "dangerouslie decayed." In consequence of these faults there was a "great danger, hurt and losse of lief and lym"; the clock was the "worst kept of any clocke in the same cittie."

Lady Gresham, who had a life interest in the building, did not exhibit her husband's generosity. The archives of the Corporation show the correspondence between her and the Lord Mayor; she was informed that some parts of the building had fallen down, and she was requested "for the honour of Her Majesty and Sir Thomas Gresham the worthy monument might not be suffered to fall into ruin and decay, but that the restoration might be carefully performed."

With all its imperfections, the first Royal Exchange stood for ninety-eight years; in 1665 the plague raged, and the grass grew within the area. The purification of the City came afterwards by fire.

On Sunday, September 2, 1666, at 1 o'clock in the morning, a fire broke out in Pudding Lane. It raged all Monday and Tuesday; to stay its ravages some houses in Cornhill were pulled down, the timbers, however, of which they were composed caught alight and spread to the Royal Exchange.

"When the fire was entered how quickly it did run round the galleries, filling them with flames, then descending spreads, compasseth the walks, giving forth flame, vollies, and filling the court with sheets of fire; by-and-by the kings fall down upon their faces, and the greater part of the stone building after them, the founder's statue alone remaining."

So it was: as the building Sir Thomas Gresham gave to the citizens passed away in smoke and flame, his image gazed calmly upon the destruction, and stood the ordeal without any harm.

## A TWENTIETH-CENTURY STYLE.

A LECTURE entitled "Is a National Twentieth-Century Style of Architecture Probable?" was given by Professor Banister Fletcher at the hall of the Carpenters' Company. Sir John Lubbock presided.

The lecturer commenced by saying he could not justly be accused of being too premature in speaking of the architectural style of a century not yet born, because time out of mind men have been proposing or prophesying new styles. One such might be remembered in which stone and brick were to be absolutely dispensed with and iron was to be universally used. One iron style was to be curvilinear, even the juncture of the floor and wall lines was to be curved, and much was made of the light and shade of perforated balconies. In another proposal the opposite extreme was to be adopted, and angularity was to be the characteristic of the new style. Day by day in this eventful year we read, or hear, again and again, of the great advance made in science. One does not see or hear any record of a similar advance in architecture. Architecture, which was formerly the record of a people's progress, is to-day only a paraphrase of bygone styles. The people are lethargic about architecture, and it may be, as some assert, that architects are themselves to blame for this condition. One thing is certain, no new style will be created until people take a deeper interest in the matter. One can have little faith in any new style except such as shall grow out of our needs, our climate and our intellectual development. All the great styles of the past have been developed from what had gone before. The Greeks did not attempt to create a new style, they only adapted preceding styles to their own wants. Place a view of the tomb of Beni Hassan side by side with a view of the Parthenon, and the prototype of the Greek work is evident. A popular fallacy is that great size is necessary to grand results, but in reality size has no relation to beauty. The Parthenon is only 100 feet wide and 228 feet deep. A still smaller temple, that of Nike Apteros, has a frontage of only 18 feet and a depth of 27 feet; yet it charms every beholder. The great hall of Xerxes at Persepolis has none of the extreme beauty of the Parthenon, although the columns of the former are double the size of the latter. The site of the Parthenon on the edge of the Acropolis rock enhances its grandeur. The

prototype of the Ionic column is found in an Assyrian tomb at Nineveh. The Greeks adopted and refined what they found suited to their needs. They were distinguished for harmony and simplicity; the Romans for conquest and grandeur. The Romans had no time for refinement; their mouldings are all struck by compasses, but it is impossible to do this with the finer lines of the Greeks. Roman work has a redundancy of ornament and a greater number of divisions in the entablature. The adoption of the arch gave the Romans a freedom which they used by placing one or more orders over another, as in the Theatre of Marcellus. The arch was known to the Greeks, but they preferred to retain the beam style. They used concealed arches structurally, and arches were in common use in countries which the Greeks conquered.

In our own country the development of architecture may be traced. The early window, without glass and very small, as every opening was a point of danger to the inmates, at first was square-headed, then circular, and then pointed. In this last is the origin of tracery. Two pointed windows are first placed together, a circle is placed over and between these, and then occurs the idea, Why not put a drip-stone, or label, to combine all under one arch? The wall spaces between are reduced to mullions and the number of openings are increased, and the lines of the pointed heads are carried on intersecting each other. Later, cusping, which at first appears as something added, becomes an integral part of the design. The curved lines gave way to the direct vertical and horizontal lines of the Perpendicular style. The window was now to become a frame, and depend for its beauty on the glories of painted and stained-glass. The light of day, shining through the parti-coloured work which was so excellent at this period, became transformed in a brilliancy of colour. All this tracery, it may be noted, is under one main arch. This is characteristic of English, German and French Gothic. The Italian, developed from the same parent, differs in being essentially a part of the structure. The mullions, transoms and tracery can be removed without injuring the English building, but in such a building as the Doge's Palace no part can be so removed. The whole length of the upper building is supported on constructive tracery.

Development can be traced in other features of the buildings. The Norman buttress is of small projection and used to strengthen the walls at the coigns or angles. A new form of roof produced the necessity for stronger construction. In the first roof every rafter is of the same value. By introducing principals (which are aptly named), the points of stress can be 10 or 12 feet apart, and if these points are supported it matters little what the wall is between. How well the builders of these buttresses understood what was wanted can be seen by placing such a series of shores as would be deemed necessary now if the wall were considered unsafe. It will be found the lines of the buttress just cover the line of the shores. With vaulted and groined roofs, which became general in England, still further support was necessary. The buttress which began at the aisle wall had to be carried over to the nave wall to take the line of thrust of the roof. This is done by means of the flying buttress, of which we have examples at Westminster, and where further stability is given by weighting the buttress with a pinnacle. The French built so high as to verge on the border line of safety, but at Beauvais there are fine examples of flying buttresses.

Time will not permit to point out the gradual development of Renaissance from the Roman; a masterpiece of the former is always with us in St. Paul's Cathedral.

Lord Rosebery has said, "How vastly unlike two portraits of the same person may be, the one taken at the age of three, the other at the age of three score and ten, yet the change has been so gradual in all the intervening time, that it could not be said on any one day, it was not the same person as on the day before." So it is with architecture. The change is gradual. The original cannot be recognised. Although sprung from the same common stock the divergence becomes so great. Compare the Parthenon with the Coliseum; the heavy plain Norman with the ornate chapel of Henry VII.; and how great the contrast and how gradual the various changes which gave such results. Mr. Jackson has recently said, "If art is to live it can only do so by colouring our whole lives;" and Professor Aitchison says, "We are neither Greeks, Romans, nor Byzantines; and our architecture must be one that will discover the needs of the age."

In conclusion, the idea of inventing a grand style is only likely to result in the well-known fruitless labour of "ploughing the sands." Buildings may want novelty, but design and planning must be, as in the past, a work of gradual development. If people will throw aside apathy and take an interest in architecture, then, and not till then, is a national twentieth-century style possible.

Sir John Lubbock said he had not quite made up his mind about the style of the future. A recent visit to the country was spent at a house which was very ugly outside but very comfortable within. There was a house having a charming exterior on the opposite hill, and the host was asked why he had not rather

selected the prettier house. The reply was, "That house is very uncomfortable inside. Here there is a pretty house to look at, and an extremely comfortable one to live in; there it would be uncomfortable to live, and in addition this ugly house to look at." Greek architecture is always dealt with in temples. We want palaces, libraries, municipal buildings (except in London) and houses. Our recently built Law Courts are not at all suitable for their purpose; the Natural History Museum has a very pretty outside, but the inside is not well adapted for a museum. We shall probably develop not one style but several. There should be confidence in the destiny and genius of Englishmen. Two thousand years is but a very small space of time, but if we remember what miserable dwellings our ancestors then lived in, we are naturally interested in looking forward to the possible changes of the future.

### ROYAL SOCIETY OF BRITISH ARTISTS.

A MEMBERS' dinner of the Royal Society of British Artists, in commemoration of the fiftieth anniversary of the granting of the Royal Charter, was held on Monday. Mr. Wyke Bayliss presided.

The President, in proposing the toast of "The Queen," said that, in obedience to the Royal command, the presidential address which he was about to deliver had been laid before Her Majesty. He had received the following message:—

Windsor Castle: March 1, 1897.

Dear Sir,—The proof copy of your presidential address to the Royal Society of British Artists, which you forwarded to me under cover of your letter of February 24, has been laid before the Queen.

Her Majesty commands me to convey to you, the president, and to the members of your Society, her sincere congratulations on the fiftieth anniversary of the granting of its Royal Charter, and also on the valuable work accomplished by the Society on behalf of art and artists during a period exactly coincident with that of Her Majesty's own life.

The Queen trusts that continued prosperity may be assured to the Society in the future.—I am, dear Sir, yours very faithfully,

ARTHUR BIGGE.

The President then delivered his address. He said that it was in 1819 that the first gathering took place which resulted in the formation of the Society. It originated not as a private enterprise, but in response to a national requirement. In 1823 the galleries in Suffolk Street were completed, and in 1824 the Society held its first exhibition. No sooner had the Society fairly begun its work than the Academicians formally declared war upon it. There were faults on both sides. The Academy passed a law debarring any member of the British Artists from becoming a candidate for academic honours. The British Artists passed a law inflicting a penalty of 100*l.* on any member withdrawing from the Society. Both laws had long since been repealed, but they created much mischief at the time. The President went on to review the history of the Society from its origin, and mentioned, among other names of its members, those of David Roberts, Clarkson Stanfield, Müller of Bristol, David Cox, James Holland, Hurlstone, Daniel Pasmore (who lived to see one of his pictures exhibited at Burlington House among the Old Masters, and engraved in the *Graphic* as a fine example of the work of J. M. W. Turner), George Cole, Vicat Cole, Henry Dawson, Henry Moore, R. I. Gordon, J. S. Noble, W. L. Wyllie and James McNeil Whistler. The record of the last ten years began with the distribution of the awards in the Fine Art section of the greatest of the international exhibitions—that of Paris in 1889. Of the 100 English artists who received medals no fewer than fifty-five—and of the twenty gold medallists no fewer than fifteen—proved to be members or exhibitors of the Royal Society of British Artists. At this period also commenced that splendid series of studies by Lord Leighton, seen nowhere else, and revealing him in a new light. They began with his first sketch for the *Daphnephoria*, and ended only with the last, made but a few weeks before his death. They were arranged in groups—120 in all. They would live as long as the name of Leighton was remembered. During these last few years the galleries had been enriched by the works of Mr. G. F. Watts, Sir Edward Burne-Jones and Sir John Gilbert, honorary members of the Society, as well as by a collection of the works of the late Cecil Lawson. Mr. Watts had been represented by many of his finest portraits, including those of Lord Tennyson, Lord Salisbury and William Morris. The works by which Sir Edward Burne-Jones would be remembered in connection with these exhibitions were the magnificent series of studies for his paintings of *The Briar Rose*. The pictures by which Sir John Gilbert was permanently represented at the Guildhall were first seen together in these galleries, where hung also the first paintings he ever exhibited. The Society, beginning with thirty-two members, to-day numbered 150. It had held 107 exhibitions, including in the aggregate about

70,000 pictures. It had effected sales for artists to the amount of more than a quarter of a million sterling. The service it had thus rendered to art and to artists had been honorary service. Such a Society was worthy of their affection and loyalty. To such a Society the past, with all its traditions, its difficulties, its achievements, was but the prelude to a still more useful and honourable future.

### ANCIENT ATHENS.

THE second of his course of lectures on "Greek History and Extant Monuments" has been delivered by Professor Percy Gardner, at the Royal Institution. He dealt mainly with the Athenian Acropolis as a background of history, starting from the devastation of the Acropolis by the Persians in 480 B.C., and working backwards. The lecturer dwelt on the account given by Herodotus of the Persian occupation, which resulted in the Athenians abandoning their city to the ruthless vengeance of the invaders, to whom nothing was sacred. The evidence of the historians could now be supplemented by the yet more truthful records on rock, marble and bronze, for recent excavations brought the monuments of old to light and completed the tale of the wreck of all works of interest and beauty by the Persians and the consequent restoration of Athens. When the Athenians returned they had lofty ideas and plans, and intended to replace the old buildings with grander ones of marble. Modern excavations enabled us to recompose temples, to set up votive images, sometimes even on their own pedestals, and to trace the development of Athens from century to century. When the Persians razed the Acropolis they were probably unaware of the existence of any earlier monuments than those which they were destroying. We now know that the history of Athens began at a period that was as remote to Herodotus as his time was to ours. Recent excavations revealed to us successive phases of the history of the capital of Greece. The earliest stratum showed house-walls, graves and terra-cottas; the second, Mycenaean pottery and palace walls, and the house of Erechtheus known to Homer; the third took us to the period when the kings gave way to Athens and the Acropolis was made sacred to the gods. The Greeks gave the name of the Pelasgic age to all the early monuments that they could not assign to any definite period. Professor Gardner then attempted to reconstruct ancient Athens at different periods. The first fixed historical landmark was the age of Pisistratus. Before his time the Acropolis was still a fortress. Pisistratus erected a temple, or the Acropolis, in honour of Athena, and some walling built by him on the road up to the temple still remained. The ground plan and style of the Pisistratid Temple were now quite apparent. In the Age of the Tyrants the early temples were of limestone, and it was not till about 600 B.C. that the age of stone gave way to the age of marble. Pictures of various pediments, the low gables which crowned the fronts of the buildings were thrown on the screen, and the restorations suggested by archaeologists shown. These showed the fondness of the sculptors for monstrous forms, to which they were more inclined owing to the form of the pediment, which suggested to the artist the display of serpents and monsters. The lecturer then went on to speak of the discovery by Studniczka of the design and part of the substance of the pedimental group erected by Pisistratus over the doors of the Temple of Athena. An account was given of the marvellous way in which the German archaeologist obtained a clue to his discovery by a head of Athena which stood in the museum. The clue was followed up, the drapery of the goddess found and other fragments pieced in, until at last the whole of the central group which represented a battle between the gods and the giants was put together out of various fragments. Professor Gardner said that within the last few days a young German student had followed up these discoveries and had reproduced the design of the whole of the figures in the pediment. The series of female figures on pedestals lately unearthed was referred to and slides shown of them. Professor Gardner thought they represented not priestesses or the goddess Athena, but were idealised portraits of Athenian ladies, in attitudes of doing homage to Athena.

### MISUNDERSTANDING TENDERS.

AN extraordinary case, *Tasker v. Chew*, was tried before the Lord Chief Justice at Leeds on Monday, of which the following report is taken from the *Leeds Mercury*:—

Mr. Atkinson, Q.C., said the action was brought in point of form to recover 258*l.* 10*s.*, but owing to the way in which the action was defended the only question would be as to a sum of 120*l.* The defendant wished to build some houses at Halton, and employed Mr. Brearley as his architect, and got him to advertise for tenders. Those obtained were in the plaintiff's opinion too much, and Mr. Brearley, the architect, asked the

plaintiff if he would send in a tender. The plaintiff inspected the site, and stated that he could not build the houses under 160*l.* for each house. Mr. Brearley suggested that he should reconsider the matter, and he afterwards wrote to Mr. Brearley stating that he had carefully gone over the particulars again, and found he could not possibly do them for less than 160*l.* per house. The plaintiff's tender was accepted, but the defendant said the contract was for 140*l.* per house, and not 160*l.* The work was continued, and certificates were given. Mr. Brearley had written to the defendant with reference to the payment of the balance due to the plaintiff, and on December 1, 1896, the defendant wrote to Mr. Brearley:—

"Dear Sir,—I am surprised at receiving such a note from you. You know perfectly well what the contract price was, and I am neither going to be fooled or robbed either by you or Tasker. If Tasker gets any more it will be through the court, then you will have to turn up the contract signed by me. The price was—and you know it—840*l.*, equal to 140*l.* per house. This is what I mean to pay, and nothing more." Mr. Brearley wrote in reply that he had told the defendant repeatedly that the price was for 160*l.* per house. He added:—"You say you are neither going to be fooled or robbed either by me or Mr. Tasker. Let me inform you that neither Mr. Tasker nor myself has ever attempted to fool or rob you. I have not the least doubt that both of us are as straight and strictly honourable as yourself."

His Lordship said the charge was a very gross one.

The first witness called was John Henry Brearley. He stated that the contract was for 160*l.* per house. At no time had the plaintiff agreed to build the houses for 140*l.* per house.

Mr. Kershaw cross-examined the witness, with the view of showing that the price was 140*l.*

His Lordship said this was a charge of the very foulest kind of conspiracy. The correspondence from the first showed conclusively that the price per house was 160*l.* Such a conspiracy might exist, but it would require a very strong case to establish it.

Mr. Kershaw said he had testimony to show that what he had called the tender signed by Tasker was taken away.

His Lordship: I cannot stop you, but I think you are working an enormously difficult case.

Mr. Kershaw proceeded with his cross-examination, and in answer to a further observation by his lordship, he said: Your lordship has evidently formed some opinion.

His Lordship: A very strong opinion. I think counsel must exercise some judicial faculty over their own cases. I really do.

Mr. Kershaw said he refused to get up and cross-examine after his lordship's strong opinion. He sat down because he could not carry the case any further.

His Lordship: That is for yourself. I am not surprised, but do not come to that conclusion because you think I am wanting to stop you. The more I see of the case the more improbable seems the case that you are asked to advocate.

Mr. Kershaw said he was not putting it that his lordship was hard upon him; but it was hard to cross-examine the witness after his lordship's expression of opinion.

His Lordship: That is no reason why you should not go on and test this man as much as you like. You have to ask the jury to believe that this man, not in a moment, but as a matter of contrivance and conspiracy, months before the event, concocted this factitious correspondence for the purpose of cheating the defendant. That is what the facts come to.

A consultation took place between counsel and the defendant, and his lordship, after waiting for a short time, said he thought it would be better for Mr. Kershaw to continue his cross-examination of the witness, and let his client go into the box. He did not think the responsibility rested with him.

Mr. Kershaw said he had put pressure upon his client in this matter, and he had suggested to him that this document which he relied upon was a lost document, and that he and the witnesses on his behalf might be mistaken with regard to the figures that might be upon it. He thought he was justified in advising his client not to proceed further with his defence.

His Lordship said the correspondence showed that the price was to be 160*l.* per house. That that was contrived in order to misrepresent was the only theory upon which that matter could be explained. He had taken the trouble to go through the letter book. The letters were all copied in the ordinary way. The counterfoil always gave the amount of the contract—960*l.*, and the amount of the instalments paid. Was it to be supposed that these gentlemen were deliberately inventing all this in order to misrepresent the true state of things, and cheat this gentleman of 150*l.*? Was it not a thousand times more likely that this gentleman might have misunderstood the figures? He was perfectly certain Mr. Kershaw had taken a proper course in the matter.

To the Jury: I do not know how the transaction strikes you as business men.

A Juryman: We entirely agree with your lordship.

A verdict was then given for the amount claimed.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

THE Edinburgh Architectural Association visited on Saturday afternoon the parish church and Calder House, Mid-Calder, by the kind permission of the Rev. J. D. Moir Porteous and Lord Torphichen, under the leadership of Mr. A. Hunter Crawford. The church at Mid-Calder is of early foundation, probably twelfth century, and the present building, which is of the sixteenth century, with modern additions, is curiously interesting from the fact that it was partly built under a bond between the Rev. Peter Sandilands, who, as an old man in 1541, wanted to ensure the completion of his work, and Sir James Sandilands, his nephew, who was to be paid 1,600 merks in consideration of his executing the works all minutely detailed in the bond. Attention having been drawn to the architectural features and the armorial device, the party, after a thorough examination of the building, proceeded to Calder House. After Mr. Crawford had given an historical description of the house, which partly dates from the thirteenth century, and contains many very valuable paintings, the party was shown through the house by Lord Torphichen, who kindly drew attention to various features of interest, and especially to the paintings in the drawing-room, formerly the large hall. Among these are the celebrated portrait of John Knox so frequently engraved, also a portrait of Queen Mary, two fine Raeburns, &c. The visit was brought to a close by a vote of thanks, proposed by Dr. Rowand Anderson, to Lord Torphichen and the Rev. J. D. Moir Porteous. St. Cuthbert's, East Calder, was also visited. This ruin is of twelfth-century date, and the south wall and two gables are still partly standing. Among those present were Messrs. John Watson, J. A. Carfrae, G. Wardlaw Burnet, James L. Caw and Rev. P. M. Herford.

## DISCOVERIES IN LINCOLN.

EVERY year evidence accumulates of the truth of the saying of Mr. Freeman that Roman Lincoln exhibits "larger traces of itself than most of the Roman towns in Britain," and the testimony forthcoming this week greatly strengthens the assertion. It will be in the recollection of many of our readers, says the *Lincolnshire Chronicle*, that from time to time parts of a very important building of the Roman period have been unearthed at Bailgate. The first discovery was due to the watchful care of Mr. Geo. Allis, of the Bail, who in 1878, while alterations were being made at his residence, discovered three columns, including the curious double one at the north angle, under his house. These have been carefully preserved and can be seen by those interested, a separate entrance to the basement of the house in which they are maintained in their original positions having been provided by Mr. Allis. Nine years later the bases of three more columns were found in the foundations of Mr. Blaze's property, which adjoins; and from time to time the discovery of other columns forming part of the same building has been duly recorded in the *Chronicle*. In the words of the late Precentor Venables, in his lecture on "A Walk through Lincoln," this building was probably the Basilica, or Hall of Justice. "It was a grander building than Lincoln had seen erected from the completion of the cathedral to the present epoch." The building, from the latest discoveries, is shown to have been 280 feet along the front, and about the same in depth from east to west—15 feet longer than the nave of Lincoln Cathedral. Up to last week seventeen of the columns forming the front colonnade had been brought to light, only, alas! with the exception of the three in the basement of Mr. Allis's house, to be covered up again, as they take a diagonal line across the roadway in the Bail, but the fourteen which have been reinterred corresponded exactly to the three mentioned, so that we can see what they are. Mr. Allis prepared a plan showing the positions of the seventeen columns thus far discovered, and there were two vacancies in the line. It has many times been mentioned that it was a pity those spots were not explored so as to ascertain whether the columns were really existent or not, and on this reaching the ears of a local lady she asked why it was not done. When she heard that it was simply a question of expense she at once generously undertook to defray the whole of the cost of the excavation. The work was entrusted to Mr. Allis, who readily obtained the sanction of the Mayor and the chairman of the highways committee to take up the street. Operations were commenced near the shop door of Mr. Blaze, and, sure enough, the base of a column was found just where expected. However, there was a surprise in store, because following out the order of the other discovered columns, this should have been a double column, but no trace of the twin could be found. In searching for it an equally interesting discovery was made. Mr. Allis's observant eye detected that the workmen were throwing up some cubes of tesserae. He at once stopped the work, and descended into the hole. It did not take him long to ascertain that there was a most elaborate piece of tessellated pavement 2 feet higher than the bottom of the bases of the columns, and at about the place where the

second column should have been if it ever existed. This pavement, from the fact that it was 2 feet higher than the bottom of the bases, must have belonged to a building of a much later period than the basilica, if such it be. At present it is not known what the structure may have been which had so elaborate a pavement, but one may hazard the suggestion, without committing oneself to the fact, that the base of the inner column, if there were two, was removed when this later structure was erected. The pavement is of a very interesting nature, and a careful drawing of the portion laid bare has been prepared by Mr. H. H. Dunn, architect. The border, which apparently forms a large square, to judge by the pattern of the corner discovered, consists of four alternate broad bands of red and white cubes, with an inner and narrower band of white. Then comes a small strip of blue cubes. A circle of blue touches each inner side of the square, and in the corner angle thus made there is a "bud" in red, blue and white. The outer circle encloses a smaller one, and between them there is what is known, we believe, as a guilloche pattern. The centre design is that of a head, plainly discernible, and around this is an elaborate design, probably intended to represent drapery; the colours used in the centre are the same as in the border, with the addition of a little purple. Could the excavations be carried further, there would probably be laid bare one of the largest and finest tessellated pavements ever found in the city, for if one may draw an inference from the wide border, what has so far been seen is only the corner piece of an elaborate design. Mr. Dunn is preparing a scale drawing, coloured, of the portion discovered, and we hope he will allow it to be exhibited both above and below hill, so that all interested may see it. The site was visited by scores of citizens, who showed a deep interest in the find. Amongst these may be mentioned the city sheriff (Mr. W. Mortimer), who expressed a strong desire that the pavement should be taken up and preserved in some public place. However, this could not be done without the consent of the Corporation to extend the excavations, and the provision of the necessary funds. Having found what he was looking for, namely, the base of the column, Mr. Allis had perforce to fill in the hole, but he did so in a manner calculated not to injure the pavement, and it is to be hoped that sufficient public spirit will be shown to insure that the explorations shall be continued, and, if possible, the pavement brought to the surface. One other column to complete the frontage of the building still remains to be unearthed, and excavations in search of this will be commenced. We shall look forward with interest to the laying bare of the last of the series which adorned the front of a building of so imposing a character. We may add that Mr. Allis communicated the find to Mr. F. C. Penrose, the eminent archaeologist, who, in reply, writes regretting the demise of the Rev. Precentor Venables and of Archdeacon Perry, who kept such careful and accurate records of like discoveries, and adds, "I hope there are others in Lincoln who feel interested in such matters—one there must be. I mean the lady whose liberality started this last investigation. She may feel sure that many archaeologists will feel indebted to her." An expression of opinion which we fully endorse. Speaking of the building in question, the late Precentor Venables said that "where the north side wall began there is a very singular twin column—two columns in one—an architectural feature previously unknown. It has been examined by many distinguished architects, who all agree that Lincoln possesses that which cannot be found anywhere else. It is thought probable that the stone entablature which ran between the columns at this point showed symptoms of failure, and the architects very wisely built another column at the side, scooping it out so as to make a double support where one was not sufficient."

#### COUNTY OFFICES, WAKEFIELD.

AT the meeting of the County Council of the West Riding it was reported that Messrs. Gibson & Russell, the architects for the new offices of the Council at Wakefield, having made a request for further remuneration by reason of additional and extra work in and about the buildings, superintending the painting and decorating and other work, the committee recommended that the architects' remuneration be increased from 3,200*l.* to 3,800*l.* (the architects having agreed to accept such sum), such increased remuneration to include all charges for completing the buildings, including boiler-house and alterations in connection therewith, preparation of plans on vellum for filing, painting and decoration, and other work other than the provision of the fittings and furniture. It was explained that the recommendation was a compromise arrived at with the architects, who originally claimed a commission on all extra work. The granting of an additional 600*l.* would make the commission paid to the architects about  $4\frac{1}{4}$  per cent., the usual commission charged being 5 per cent. The resolution was carried. The committee further recommended that Messrs. Gibson & Russell be employed to superintend the work con-

nected with the fitting-up and furnishing of the new county offices, the fees to be paid to them to be 5 per cent. on the outlay, provided that the total fee should not exceed 600*l.*, such fee to include all designs, specifications and estimates, visits to inspect furniture and fittings in course of construction from time to time, the testing of the electroliers and all other services necessary to the complete and satisfactory carrying out of the work. This recommendation was adopted. It was resolved to make application to the Local Government Board for their sanction to the borrowing of the further sum of 43,500*l.*, making, with the sum of 65,000*l.* already sanctioned, a total of 108,500*l.*, for the completion of the erection of the new county offices at Wakefield, and for the furniture and fittings in connection therewith, and that the period of repayment be thirty years.

#### MODERN PAINTING.

ON Saturday evening Professor Baldwin Brown, Edinburgh, lectured in Moffat to a large company on "Modern Painting." Impressionism, he said, was really nothing new. It was practised by Velasquez in the seventeenth century, and it could be followed by two processes. By the analytic process the artist treated the different objects in a scene one by one, reproducing them as exactly as possible, or he could take the other process, and regard the scene as made up of so many patches of tone, colour, and light and shade, which he had correspondingly to reproduce. The analytic process led the artist to make the picture more complete than it actually was, and it became an explanation, distinguishing lines which were in nature obscure and colours which were blended. The second process enhanced the mystery of nature, and gave the appearance of things, while the analytic gave the representation of things. Impressionism did not dominate modern painting, but remained the ideal towards which modern painting tended more and more to conform. Portrait-painting had undergone a great change. Modern portraits, while excellent as portraits, were not pictorial. In modern painting there was an absence of the religious and classic subjects once so strong, and there was a break from the traditions in that, owing to the introduction of the factory system of production, things of utility were not now adorned as they had been from earliest times. Then the old masters stood out from the general body of artistic craftsmen. They had still the domestic style of sculpture, the monumental style had died out, and sculpture had passed under the influence of painting, which was the dominant art of the day. Painters were on the increase, and Scotland produced a large number, whose works shown in the Edinburgh and Glasgow exhibitions he thought had done more for the lovers of pictures than the Academy exhibition in London.

#### THE ARCHITECTURAL OUTLOOK.

ON Monday, at the meeting of the architectural section of the Glasgow Philosophical Society, Mr. David Barclay, architect, delivered a lecture on "The Architectural Outlook." He said that former ages had left a legacy of great works in architecture which were possible under the conditions of civilisation then existing. But present conditions of civilisation, while spreading general culture and comfort and art surroundings amongst the people, were not likely to demand, and therefore would not give opportunities for creating buildings which would rival those of the past. Facilities for studying the past and for art and science education were greater at the present than at any former period, and a high level of artistic ability was very general, and must tend to a higher average of good work. The highest level, however, would depend on genius, to which education alone did not prove an open sesame. The conditions of the abused system of architectural competition had reached as low a level as possible and showed some hope of amending, and in the meantime and immediate future there was an abundance of work in which he hoped all might have some share and do something for art that would leave a good impression of the times of the good Queen Victoria. At the annual business meeting of the section Mr. McGregor Chalmers was re-elected president; Messrs. McBean and Carlton, vice-presidents; Mr. William Howitt, treasurer; and Mr. Lindsay Miller, secretary.

**The Jury for Painting** in connection with this year's Salon will consist of the following members:—M.M. Cormon, president; F. Barrias, J. Breton, Benjamin-Constant, Busson, Raphael Collin, Dantan, Dawant, Gabriel Ferrier, Glaise, Guillemet, Harpignies, Henner, Humbert, J.-P. Laurens, H. Lévy, Renard, de Richemont, Roybet, Thirion and Vibert.

## TESSERÆ.

## Designing Buildings.

IN designing a building the various requirements of the structure should first of all be attended to exclusively with reference to its practical application. These should be strictly carried out without any deviations arising from a prejudice for a particular rule of proportion or for the sake of a supposed beauty of effect. The building having thus been conceived of as to its mechanical construction, it will then remain to display this construction decoratively with mathematical correctness, and the result will be more or less perfect, according as the architect has correctly or not solved the mechanical problem; the beauty of the structure being greater the deeper his perception has been of the mechanical construction, even to its minutest details. Thus the problem of building is not unlike that which the sculptor solves, for he has to carve his statue in accordance with the science of anatomy, and he does this most perfectly when he has succeeded in displaying even in the smallest particulars the internal structure of the body. Let, therefore, the architects of the present day look less behind them. Let them simply learn from the past those principles which are to be followed in the future. Let them also have a strictly liberal education, and above all a sound knowledge of statics in order that they may be able to carry out correctly and fully in their decorations the mechanical construction of their designs. As it is at present, architects, and too frequently general writers on architecture, form their notions of excellence on views of their own which are often a little more than prejudices. They venture on criticisms, while they have no other modulus than that which they themselves have created, and which has been determined to a great extent by their education and the accident of place. Thus Mr. Fergusson in his Handbook says of St. Antonio at Padua:—"A signal failure was the result, for an uglier church can hardly be found anywhere;" and of St. Petronio, Bologna:—"It is fortunate that it stopped there, as no uglier building was ever designed or executed." Such remarks can only be of value as showing to how great an extent the standard of beauty, set up by particular individuals, is subject to sympathies which are the result of a particular mental training.

## Generation of Surfaces.

Any surface may be traced out in space by a line, curved or straight, provided the motion of the line be properly directed. The moving line is called the "generator," and one method of directing its course is to compel it always to intersect a fixed line, together with certain other conditions, as, for example, that in every position it shall make a given angle with the fixed line; the fixed line is called the "directrix." As an example, suppose we place a pencil with its point on a piece of flat paper, and let the point trace a circle on the paper, to which the pencil always remains perpendicular; then we shall find that the pencil itself will trace out a cylinder. In this case the pencil is the generator and the circle is the directrix; also the condition has been given that, as the pencil moves, it shall always remain perpendicular to the paper. Again, if a circular ring be made to slide along a pencil upon which it is suspended, the pencil being kept horizontal, the ring will trace out a cylinder. In this case the ring is the generator and the pencil the directrix, and the conditions are that the pencil be kept horizontal, the ring being made to slide so as always to lie in a plane parallel to the one in which it was always at first placed. The line joining the extremities of the arc, or the free extremities of the arcs forming the directrix, will be called the "base," and a line dropped from the vertex perpendicular to the base the "altitude."

## Raphael and Vitruvius.

Celio Calcagnini had the highest admiration for Raphael; Ludovico Dolce was the eulogist of Titian; Portius, whose amicable relations with the Florentine painters may be inferred from various circumstances, lectured at Florence on the Aristotelian doctrine relating to colours early in the sixteenth century. In a letter to Ziegler, the mathematician Calcagnini speaks of Raphael as "the first of painters in the theory as well as in the practice of his art." This expression may, however, have had reference to a remarkable circumstance mentioned in the same letter, namely, that Raphael entertained the learned Fabius of Ravenna as a constant guest, and employed him to translate Vitruvius into Italian. This MS. translation, with marginal notes written by Raphael, is now in the library at Munich. The Italian translations were later, but still prove that these studies were undertaken with reference to the arts, for one of them is dedicated to the painter Cigoli.

## Cleavage of Slates.

A slate may be defined as a rock having the property of cleavage or fissility, or both combined, the rock parting into layers with relatively smooth surfaces. In slates the mineral particles are usually of small size. A schist is a rock having the property of cleavage or fissility, or both combined, the rock

parting into layers with rough or wavy surfaces. In schists the mineral particles are larger than in slate. As is well known, there are all gradations between slates and schists. In origin and essential characters the two have many properties in common. Schistosity, however, indicates more severe metamorphism than slatiness. It follows, from the above definitions, that a slate or a schist may have the property of cleavage or of fissility, or of both combined. When both are present they may be parallel or intersecting. Both may occur in the same slate or schist in more than one direction. Sorby explains rock cleavage as mainly caused by the rotation of mineral particles, and especially mica, so that their longer diameters and the cleavage of the mica particles are normal to the greatest pressure. The rock readily parts along the greater dimensions and cleavage of the mineral particles. The minute mica plates were supposed to be fragmental particles deposited in the plane of bedding, and to have been rotated by the movement of the rock to a position normal to the pressure. Sorby also showed that the laminar hydrous silicates, such as chlorite, develop *in situ* parallel to the cleavage. He did not think that this was true of mica in slates, but believed that the parallel mica flakes of mica-schist formed *in situ* during the recrystallisation of the rock. Sharpe and Tyndall explain cleavage as due to the flattening of the mineral particles by pressure, so that they have a parallel arrangement with their shortest axes in the direction of greatest pressure. This cause and the causes given by Sorby have ordinarily been regarded exclusive of each other, but it is believed that they may be mutually supporting. Van Hise is convinced that in the interstices, and by the decomposition of the larger particles, new minerals, and especially mica, abundantly develop with similar orientation and with their longer diameters or cleavage, or both, parallel to the flattened or rotated original particles. The innumerable parallel minute flakes of cleavable minerals in slate, especially mica and chlorite, which are almost universally present, are in no case detrital, but have developed *in situ*. Usually it is easy to discriminate the large, comparatively sparse fragmental mica plates, if any are present, from those which are autogenic. As soon as a new mineral particle has developed it is subjected to flattening and rotation precisely as an original mineral particle. This parallel arrangement of minerals developed *in situ* is probably the most important single cause of cleavage.

## Nero as a Builder.

The architects employed by Nero after the great conflagration of Rome in the construction of his Golden House, which surpassed all that was stupendous and beautiful in Italy, and proclaims the extravagance of the emperor as much as anything else he undertook, were Celer and Severus. Nero's statue, 120 feet high, stood in a court ornamented with porticoes of three files of lofty columns, each file a mile long; the gardens were of vast extent, with vineyards, meadows and woods, filled with every sort of domestic and wild animals; a pond was converted into a sea surrounded by a sufficient number of edifices to form a city; pearls, gems and the most precious materials were used everywhere, and especially gold, the great profusion of which within and without, and even on the roofs, caused it to be called the Golden House; the essences and perfumes continually shed around showed the extreme extravagance of this inhuman monster, who for the purpose of gratifying his pleasures seized on the wealth of others. Among other curiosities was an eating-room, in which was represented the firmament constantly revolving, imitative of the motion of the heavenly bodies; from it was showered down every sort of odoriferous water. Nero did not complete this palace, as the first order of Otho was the sum of ninety millions of sesterces for the finishing it. The ground not occupied by it was left to the inhabitants of Rome to build their houses on, which were not rebuilt in the same manner as after the conflagration by the Gauls; the streets were made more spacious, the squares widened and surrounded by porticoes. The emperor published many wise regulations to prevent the repetition of a misfortune which some imputed to him. At a certain height wood was not permitted to be used, but stone from Alba or Galba as the most likely to resist fire; reservoirs were provided, and persons constantly ready to render the most prompt assistance in case of accident; the houses were to be at a certain distance from each other, and they were to have no wall in common. These regulations rendered the city more beautiful, more commodious and more secure; nevertheless, the wide streets were objected to as not affording sufficient shelter from the sun. But it is usual to condemn all that is new, particularly if the projector is disliked, as if the vicious could not do anything that was good. Suetonius assures us that Nero intended to extend the walls of Rome to Ostia, and afterwards by means of a canal conduct the sea to the Seven Hills, an idea very likely suggested by these two architects, who were great projectors, and who undertook to make a canal from Lake Avernus to the Tiber. This canal was to be 160 miles long and sufficiently wide to admit of two vessels abreast; all the prisoners were collected,

immense treasures were exhausted in cutting through mountains, but the obstacles they met with dispirited them, and the work was relinquished; the motive was ridiculous, being only to prevent vessels from doubling Cape Misenus. His great palace was but of short duration. The emperor Vespasian restored to the people the lands which Nero had taken from them, and thus the Golden House disappeared like one of the enchanted palaces of Tasso and Ariosto, and in its place arose the mighty Colosseum and the magnificent Temple of Peace.

#### Historical Painting.

Among the Greeks art and life went hand in hand. All the external circumstances of life, especially the costume, were of such a nature that they fulfilled, as they were, the laws of beauty and taste which the highest aims of the art require. The artist therefore was involuntarily impressed with his studies in the living world around him, which is an immense advantage. He enjoyed the same opportunity for the study of the human figure by the public exercises in the Palæstra. If the outward forms of life had not in the Middle Ages this purely plastic character, yet the feeling for the picturesque found nourishment in very many respects—in the architecture, in the various costumes, in the richness and variety of the materials used for clothing. But such ugliness, deformity and tastelessness has gradually arisen in the whole external world, that the historical painter is compelled to begin his work by total abstraction from the reality with which he is surrounded, in which he can find nothing corresponding with his object. He must create out of his fancy alone and complete the details with the dead, wretched aid of models and draperies artificially thrown over lay figures. If we consider what is required, under such circumstances, to create a work of art which shall produce in every part the impression of the intellectual, animated and transitory, we ought in reason to be filled with the greatest admiration for an artist who produces such a performance and look with indulgence on single imperfections. Besides this, the position of an historical painter with respect to the public is unhappily still essentially the same as in the last centuries; for whatever boast may be made of the increasing interest in the fine arts among the most civilised nations of Europe, it has partly extended principally to the other branches of painting, conversation pieces, landscapes, &c., and partly—it is with few exceptions—only just lively enough to allow art, like a game at whist or l'ombre, a place among the various amusements of mankind. Even this kind of interest is confined to a proportionably small circle, for not to speak of the lower classes of the people, the peasant and the mechanic, there are in what are called the educated one hundred to one for whom the fine arts have no existence. How infinitely remote, then, are we still from being able to call them a general intellectual want.

#### Vanbrugh as a Creator.

As we have neither an acclimated foreign style, the high and the low Classic being essentially southern, nor a native one suitable to every purpose, palatial and domestic, religious and secular, some new style may perchance sooner or later spring from those two most prolific seeds of invention, necessity and abundant knowledge. This hope, to be sure, this faint perspective of a new style, will appear chimerical to those who presume the human species near its end, judging mayhap from its present corrupt nature and numerous anilities; but as our unprophetic eyes have not yet perceived in the sidereal distances any glimmer of the last conflagration, we think time enough possibly remains for realising the hope if they will follow any clue to novel discoveries besides cotton-twist or steam. We, moreover, hold the mind of man to be a perpetual pendulum, moving backward and forward by turns, a sort of so-called gridiron pendulum, some of whose bars lengthen while others contract, and it may, peradventure, take a swing in the direction we speak of. As proof we are not dandling a mere child of imagination, let us cite a compatriot who, with a spice more of independent spirit, had probably laid the corner-stone of a new and noble architectural style—Vanbrugh—whose name, preserved in the vinegar of an epigram, has by this means its best hold on endurance. His genius, like a Rosicrucian lamp, burns with a feeble and ineffectual fire beneath the mountains cut into stone of Blenheim and Castle Howard; lay it open to the sunlight of reason and it disappears. Yet suppose this man possessing vivid powers of creation and composition, a picturesque enthusiasm, a decorative taste intrinsically Gothic, to have shaken himself altogether free from the shackles of Classic superstruction, instead of distorting and convolving its rectangular forms into curves of double curvature, and heaping up an architectural chaos of its elements, for the poor and illicit purpose of effect, like a landscape gardener—suppose him to have endeavoured at filling in the beautiful contours of his edifices by homogeneous features, features which the climate, the customs and the materials of the land suggested—it is no Utopian theory that he might have blocked out a new type, or at least sown the acorn of a future magnificent growth in the public mind. That man's tenure of earth is a lease of lives renewable for ever may be doubtful to all

but philosophers; let it merely equal the tenure by which the pyramids hold their ground, and we can scarce think nature will lie fallow so long a time of original architectonic productions. If she do it is only because he continues to plough her with the reversed share and delve her with the mattock wrong end downwards.

#### GENERAL.

**Mr. Thornycroft, R.A.**, has been commissioned by the Corporation of Durban, Natal, to execute a statue of Her Majesty the Queen, similar to that in the London Royal Exchange, and which is to be placed in the local Town Hall to commemorate the Diamond Jubilee.

**The Building Committee** of Truro Cathedral have decided to arrange for the laying of the foundation-stone of the nave immediately. The sum already collected amounts to 23,000*l.*

**The Dean and Chapter of Peterborough** have purchased an ancient farmhouse built of the same stone as the cathedral, in order to afford a supply to be used in the restoration.

**The New Cathedral Library**, Hereford, is to be opened by the Archbishop of Canterbury on April 30.

**Messrs. R. Horsfall & Son** have prepared plans for the new Queen's Hall which is to be erected in Halifax at a cost of about 16,000*l.*

**Lord Loch**, formerly High Commissioner of South Africa, has purchased Stoke-by-Clare College Estate in Suffolk, containing 3,050 acres, with mansion and homesteads. The price given was 34,600*l.* Stoke College stands on the site of a religious establishment which was removed from Clare by Edmund Mortimer, Earl of March.

**Mr. J. A. Settle**, who is engaged in the surveyor's department, Bolton, has been appointed surveyor of Heywood. There were forty-three candidates.

**The New Lecture Theatre** of the Royal Dublin Society has been inaugurated. It will accommodate 800 people. Sir Thomas N. Deane & Son are the architects.

**Mr. Orchardson, R.A.**, is to be entrusted with the commission for the portrait of Lord Peel which is to be placed in the Speaker's house.

**Sir E. J. Poynter, P.R.A.**, was on Saturday last elected president of the Royal Birmingham Society of Artists, in succession to Mr. Alma-Tadema, R.A.

**The Glasgow Memorial** of the Queen's reign is to be a reconstruction of the older part of the Royal Infirmary.

**Lady Wallace**, it is understood, has bequeathed 5,000*l.* to the Artists' General Benevolent Institution.

**The National Gallery** will be opened again on Sundays from April 4 to September 26, between the hours of 2 and 5 or 6 P.M., according to the season.

**A Memorial** of the brothers William and John Hunter, the anatomists, is to be erected in Glasgow, but the form of it has to be determined.

**Mr. T. W. Cubbon** was, at the last meeting of the Birkenhead School Board, appointed architect for new schools to be erected in Well Lane, at the south of the borough.

**The Commissioners** of Kingstown, co. Dublin, invite architects to send plans, &c., for public baths, which will cost 6,000*l.*

**Mr. W. R. Lethaby** will read a paper on "Lead Work" before the Applied Art Section of the Society of Arts on the 30th inst.

**Mr. A. Ramsell**, of Derby, has prepared plans for a new opera house which is to be erected in Dudley at a cost of about 10,000*l.* The extent of the site will allow of the erection of an arcade with shops on two sides of the building.

**Ingres's Portrait** of M. Bertin, who was formerly editor of the *Journal des Débats*, has been purchased for the Louvre, the price given being 80,000 francs.

**Mr. Frank Matcham** has completed the designs for the new Empire Palace, Leeds, the work comprising also two arcades and three or four blocks of shops. The principal front will be in Briggate.

**Mr. W. J. Dibdin**, the chemist to the London County Council, has resigned his office in order to engage in private practice.

**Additional Wall-Paintings** have been commissioned for the Royal Exchange. In the ambulatory Mr. Seymour Lucas, A.R.A., has depicted "William the Conqueror giving the Charter to the Citizens," at the expense of the Corporation. The Mercers' Company have commissioned Mr. E. Crofts, A.R.A., to paint a panel of "The Opening of the First Royal Exchange by Queen Elizabeth." Sir Samuel Montagu, M.P., has commissioned Mr. Solomon J. Solomon, A.R.A., to paint a panel of "Charles I. Demanding the Surrender of the Five Members at the Guildhall," and Mr. Carl Meyer has asked Mr. Sigismund Goetz to paint "The Offer of the Crown to King Richard at Baynard's Castle."

# The Architect.

## THE WEEK.

COMMON juries who have the privilege of serving in the High Court do not appear to set a great value on an architect's reputation. A man, especially of the licensed victualler species, can apparently say an architect is a thief and a robber, with a variety of adjectives thrown in for emphasis, and threaten to do his best to ruin his victim, and the entertainment will only cost five guineas. That was the experience of Mr. E. J. STREVEVS, architect and surveyor, on Tuesday. The defendant pleaded that all he said was only abuse and did not amount to defamatory matter. The jury adopted that ingenious theory of the slander. If the case were reversed and the architect had charged the victualler with thievery and robbery and had sworn to have his public-house deserted, would a London jury be as merciful in awarding damages?

THE members of the City Lands committee have testified to the merits of their chairman, Mr. MATTHEW WALLACE, J.P., of the Albion Iron Company, by presenting him with a silver épergne and service of plate. The work of the committee has been most successful, and this is owing in a large measure to the business capacity, tact, public spirit and impartiality of Mr. WALLACE, who devotes much of his time on which there are so many claims to municipal interests. The gift is valuable, but it will be more prized by Mr. WALLACE on account of the friendly feelings which inspired the presentation, and will be regarded as an incentive to further exertions for the benefit of the citizens of London.

THE works committee of the London School Board have recommended the Board to purchase from H.M. Commissioners of Works, for the sum of 6,000*l.*, about 56,628 square feet of property at Millbank, having two frontages of 118 feet each to a new road to be constructed by the London County Council. It has also been arranged that the Board shall pay to the Council the proportionate cost of constructing the roads and sewers on their estate (of which the property now proposed for purchase forms a part), together with the proportionate cost of the properties to be acquired by the Council in Winchester Terrace, Causton Street and Vincent Street, for approaches, at a total estimated cost of about 2,800*l.* In the event of any difference arising between the County Council and the Board with regard to the payment to be made for the roads, &c., it is stipulated that the question shall be settled by H.M. First Commissioner of Works.

WE must always expect something abnormal in whatever relates to administration in Dublin, and there will be no surprise to find that the valuation of the city for taxation is based on a system that is unique. According to a paper which was read before the Statistical Society of Ireland on Tuesday, it appears that since 1878 the sums spent on the betterment of the city amounted to over 1,000,000*l.*, but the increased valuation of the city since 1878 bore no proportion to this enormous expenditure, only 107,867*l.* having been added to the valuation. When the Municipal Council secured the management of the city the valuation was reduced by 159,000*l.* At the same time, a debt of nearly 300,000*l.* was handed over, which the present Corporation were annually reducing. Apart from the reduction mentioned, the subsequent annual revision and present state of the valuation of the city were made quite unfair to the ratepayers in general, and not in accordance with the law. The law in both countries was identical, but the difference between England and Scotland and Dublin was that in the former countries the law was carried out, and in Dublin it was not, and there was no provision for the gross rental as the basis of value. In the principal streets of the city the valuation was about one-third of the rental. In Dublin the only idea of increased value with a poor-rate collector had appeared to be one of a struc-

tural change or an original construction, the fallacy of which standard was obvious. One of the speakers pointed out that London was revalued every three years. They might take it for certain that Dublin was not revalued every year. There was no practice in Dublin of going back in valuation and raising it as the houses increased in value. The changes in the rent were not taken into account, and no effort was made by the Commissioners of Valuation to do so. Another speaker explained the anomaly, when he said that very many members of the Dublin Corporation were opposed to revaluation for personal reasons, because they were interested in house property, which was at present undervalued, and on that account they would not sanction any change.

THE return of the Science and Art Department relating to the application of funds by local authorities to technical education shows that the expenditure is increasing. The amount in 1894-95 was 737,809*l.*, while the estimated expenditure for 1895-96 was 793,507*l.* Among the loans on the security of local rates for 1895-96 for erection, extension, or furnishing technical school buildings are 2,024*l.* at Stockport, 850*l.* at Runcorn, 700*l.* at Bideford, 3,708*l.* at West Hartlepool, 11,000*l.* at Dover, 2,100*l.* at Margate, 3,591*l.* at Tunbridge Wells, 10,000*l.* at Bolton, 40,000*l.* at Manchester, 5,059*l.* at Accrington, 2,000*l.* at Darwen, 10,333*l.* at Widnes, 1,400*l.* at Radcliffe, 5,000*l.* at Leicester, 14,500*l.* at Bath, 1,800*l.* at Tunstall, 850*l.* at Godalming, 20,000*l.* at Birmingham. Out of the 49 county councils in England 38 are applying the whole of the residue received under the Local Taxation (Customs and Excise) Act to technical education, and 11 county councils a part of it to the same purpose. Of the councils of the 61 county boroughs, 54 are devoting the whole of the residue to technical education, and 7 a part of it. Further, the councils of 13 county boroughs, 67 boroughs and 109 urban districts in England are making grants out of the rates under the Technical Instruction Acts; and 7 local authorities are devoting funds to technical education out of the rate levied under the Public Libraries Acts. There were 25 local authorities that raised sums by loan on the security of the local rate under the Technical Instruction Acts during each of the years 1894-95 and 1895-96.

IN Warwickshire there is a remarkable ridge of quartzite at Hartshill which is assigned to different formations, as well as several carboniferous beds, while at Caldecote volcanic tuff, quartz, porphyry and diabase are found. It is now evident that the Romans were able to use the stone for pottery or other purposes. Four years ago a Roman kiln was discovered near the village of Mancetter, but its value was not realised until too late, and as the important parts were destroyed a systematic examination was impossible. Last week, on the other side of the roadway, at what was known at the Caldecote Quarries, a second kiln was found, and care was taken to avoid damage in the uncovering. A careful search was made, and a third kiln, in a wonderful state of preservation, was unearthed. Remains of pottery have been found, chiefly of dark-blue slate colour, including a perfect specimen of a cinerary urn, about 5 inches high. The kilns, which were about 16 inches below the turf, are oval in form and measured 48 inches by 60 inches.

THERE is likely to be much competition among cities for the privilege of holding an exhibition in 1901, for many of the objects which appeared in the Paris Exhibition of 1900 will then be available for other places. The Glasgow Corporation are the first claimants in this country. It is proposed to hold the exhibition in Kelvingrove Park, and the Corporation will guarantee a sum of 5,000*l.*, besides allowing the use of the new art galleries buildings and of the ground. It is to be understood that if any surplus accrues from the exhibition it is to be handed over to the Corporation to be applied to art and science purposes. As soon as 50,000*l.* can be guaranteed a meeting is to be called for the purpose of forming an exhibition association. In 1888 the guarantee fund amounted to 320,000*l.*, and it is probable a far larger sum will now be subscribed. The project merits encouragement, and the precedent of 1888 is a guarantee of success.

## EUSTACHE LE SUEUR.

TWO hundred and sixty years have elapsed since EUSTACHE LE SUEUR, who afterwards painted the picture we illustrate this week, entered the atelier of SIMON VOUET as a pupil. About the same time another pupil, named CHARLES LE BRUN, made his appearance. There was a great difference between the social circumstances of the pair. CHARLES LE BRUN, who was the younger, was under the protection of Chancelier SÉGUIER, the most powerful subject in all France after RICHELIEU. LE SUEUR was the son of a poor turner in wood who was unable to pay a livre as a fee, and EUSTACHE was therefore received as an object of charity. In the old ateliers a pupil of that kind was compelled to pay dearly for his privilege by constant drudgery, and he had to submit to the tyranny of more fortunate fellow-pupils as well as of the master. EUSTACHE LE SUEUR was in one sense ill-adapted for the position. He was timid and industrious; he was therefore likely to have heavy labour cast upon him, and he was unable to resent injustice. LE BRUN evidently looked down upon him, and as long as LE SUEUR lived plumed himself as the superior. SIMON VOUET was too great a man to bother himself about the squabbles of his pupils or assistants. He was the master of LOUIS XIII., of princes and princesses, and it was a high honour if he condescended to look upon a plebeian's drawing and to point out its weakness.

In those days it was indispensable for everyone who aspired to be a painter to study in Rome. VOUET's atelier was only a sort of elementary school where young fellows were prepared for the Vatican. LE BRUN was not only destined to follow the usual course, but he was to appear in Rome as a representative of France. There was no hope of that kind for EUSTACHE LE SUEUR; he was to content himself with being an artist's journeyman. We know it is sometimes an advantage when dealing with currents of air and water of which we wish to increase the force to interpose obstacles to their courses. In the same way the limitations amidst which LE SUEUR lived only strengthened his genius. Maréchal DE CREQUY, French ambassador in Rome, opportunely brought some examples of Italian art to Paris, and those by early masters were studied by the young apprentice with an eagerness that could hardly fail to be productive. An opportunity arrived for him to employ the knowledge he derived from them. A commission was given to VOUET to prepare a series of eight designs from the "Hypnerotomachia di Polifilo," or "Dream of Polifilo," by the Dominican monk FRANCESCO COLONNA. No two people can ever agree about the signification of that wonderful and interminable dream, or "Battle of Love in a Dream." We can imagine the consternation of so busy a man as VOUET, who had a monopoly of the most lucrative commissions, at the thought that he was to select subjects out of what seemed to be an inextricable jumble. So he tossed over the book to his drudge EUSTACHE. He expected to have designs produced which would bear some resemblance to his own, and which he might send in with his name attached to them. LE SUEUR was too well inspired to treat them in a style that was false and not personal. His designs satisfied all who saw them except SIMON VOUET. Tapestry was made from them, but, in common with several other productions of the Gobelins, they have disappeared. VOUET was dissatisfied, for his pupil had shown that he possessed individuality, which was not a becoming quality in one who had not paid the proper fee, and he could not, therefore, any longer look upon him as a most useful "ghost."

EUSTACHE LE SUEUR then began on his own account to paint pictures for churches. Happily he also met with one of the most generous of secular patrons. This was LAMBERT DE THORIGNY, the president of the Chambre des Comptes. He had erected a noble mansion in the Isle St. Louis, eastward of Notre Dame, still known as the Hôtel Lambert. The commission for decorating it was offered to LE SUEUR, without any restriction as to the time in which it was to be completed. The artist was occupied with the paintings during the rest of his life. Apparently the whole arrangement and choice of subjects were left to him. In the Louvre there are several of the paintings which have been removed from the hotel, where they adorned the Cabinet de l'Amour, which was so-called because the artist illustrated the history

of CUPID. Among the subjects are *The Birth of Cupid*, *Venus presenting Cupid to Jupiter*, *Venus Scolding Cupid*, *who takes refuge in the arms of Ceres*; *Cupid receiving the Homage of Gods and Goddesses*, *Cupid instructing Mercury to announce the universal power of Love*, *Cupid Stealing the Thunderbolt of Jupiter*. Many other mythological subjects were painted on the walls and ceilings of the house. Let no one imagine the pictures have any of the characteristics of the debased works of the Renaissance. LE SUEUR was one of those men who could see only guileless subjects in ancient legends, and he could not be either sensuous or sensual in his forms or colours. In many ways he seems to have corresponded with JOHN JAMES RIDLEY or "J. J." in "The Newcomes," but instead of visions of such heroes and heroines as were sure to arise in an age when Sir WALTER SCOTT was performing his wizard tricks, the French artist could only perceive ascetic men and women who had renounced the world, or beings like CUPID and his mother, who were as unsubstantial as the air. So close a correspondence was seen between the characteristics of LE SUEUR's own life and those of many of his non-Olympian subjects, that his contemporaries supposed his favourite dwelling-place was among the Carthusians in the Rue d'Enfer.

There was, however, a sincerity in LE SUEUR's work which attracted attention from those who had the bestowal of commissions. LE CAMUS, the superintendent of the royal palaces, ordered from him for the king's chamber a large picture representing Monarchy leaning on a globe and accompanied by figures of Justice, Courage and Renown. For the same chamber LE SUEUR executed "camaïeux" on a gold ground of the four quarters of the world. In the adjoining room was another allegorical picture showing Authority seated on a throne, with Time studying a record which History is writing, while below were figures of children playing with a lion. ANNE of Austria also engaged the painter to adorn her bedroom, bath-room and an adjoining room. It was alleged that some of the paintings were removed by ROMANELLI, one of Cardinal MAZARIN's painters, who was worried to see work which he could not surpass; but there is a record which is evidence that up to 1710 eight of the paintings in the bath-room of the queen-dowager had survived. It must be regretted that the paintings can no longer be identified. A drawing of one, *Parnassus*, which is in the collection of the Louvre, suggests there was some reason for comparing them with RAPHAEL's works.

The world is more fortunate in possessing some of LE SUEUR's pictures which were devoted to the life of St. BRUNO, although as they were subjected to rehandling by later artists and were not properly conserved, we can only imagine their original appearance. The convent of the Carthusians was not very large, and the cloister which the artist was called to decorate was not very important. Nor is it likely the payment was liberal. These facts should be borne in mind by everyone who criticises the twenty-two pictures in the Louvre. There are deficiencies in the figures arising from negligence, but it is evident that LE SUEUR was able to persuade the monks to serve as models, and in those days few painters cared to keep so near to reality. It was illegal to employ a nude model, and the admiration of the antique compelled artists to prefer statues to living beings. From their position in the cloister the paintings could be injured without much likelihood of the detection of a culprit. LE BRUN and other painters were accused of sharing in such vandalism, but there is not a tittle of evidence against the former beyond a sort of tradition. The pictures were completed in 1648, when LE SUEUR had reached his thirty-first year. The Académie Royale de Peinture et de Sculpture was also founded in 1648, and as he was selected as one of the twelve artists who were to rank as *anciens*, or founders of the institution, his value as a painter was evidently appreciated by his contemporaries. LE SUEUR painted a picture of *St. Paul Expelling Demons at Ephesus* for the Academy—a work which has disappeared—but he was too genuine an artist to take part in prescribing regulations which could only fetter art and accordingly he resigned his office. His resolution to take no part in the proceedings was likely to be strengthened when he found that LE BRUN was on the opposite side, and eager to exercise authority. For the *protégé* of SÉGUIER

was more of a favourite with fortune than when he entered VOUET's studio. LE BRUN had distinguished himself while in Rome, and on his return Cardinal MAZARIN was proud to aid him and to present him to the king. FOUQUET the munificent confided to LE BRUN the decoration of his château, a building which afterwards excited the envy of LOUIS XIV., and settled a pension of 12,000 livres on him. It would be strange if LE SUEUR could rejoice at the presence of a rival who possessed so many of the qualities which the world always admires, while he was forced to depend for success on his art alone. The two men were representatives of two species of artists, and if they had lived as long as the patriarchs there would be at the end as little approximation between them as there was in the days of their apprenticeship.

Without their rivalry we should not, however, have possessed the painting of *St. Paul Preaching at Ephesus*. It was the custom in the seventeenth century for the goldsmiths of Paris to present at the beginning of May a painting to the cathedral of Notre Dame. The brilliant CHARLES LE BRUN was selected to receive the commission for the gift of 1648. His subject was the *Crucifixion of St. Andrew*. The commission for the following year was given to LE SUEUR, and he painted *St. Paul Preaching at Ephesus*. It was manifestly his aim to demonstrate that, although he was not fortunate enough to study in the Roman galleries, he was competent to follow the principles of the Roman school. LE SUEUR must have thought over RAPHAEL's cartoon, and had the courage to measure himself with that master. The laws of composition in modern times are so different from those which were formerly followed, the picture may now be considered as too academical. But it is accepted by French artists as one of the glories of their school, although as painters they would hesitate before imitating the arrangement. In most of the other works of LE SUEUR the excessive modesty of the man is apparent, but in this case he seems to have displayed a power and majesty which are only rivalled by the great masters. VICTOR COUSIN, who had always to speak with caution as the representative of the French school of philosophy, was not afraid to suggest that EUSTACHE LE SUEUR in this work is at least equal to RAPHAEL. He relates how he visited Hampton Court in order to study the cartoons and to compare the Roman *Preaching of St. Paul* with his countryman's work. The older picture, he says, carries us at once towards the ideal. The other is less striking at first, but little by little its emotional power prevails, and goes on increasing. The figure of St. PAUL by RAPHAEL is shown enveloped in a grand robe which falls in splendid folds, and displays the tall figure of the orator. But as the figure is in shadow, what is seen has nothing of the marvellous. LE SUEUR, on the contrary, shows the figure fully, for it faces us, and it expresses inspiration, terror and majesty. COUSIN considers that the picture also recalls the *School of Athens* by the extent of the scene, the architecture and the able distribution of the groups. There are a greater number of personages and of episodes in the Roman work, while in the French picture, whatever action is seen among the subordinate figures, is the effect of the words of St. PAUL, who is like the JUPITER of Olympus, but animated by a different spirit.

LE BRUN could not fail to recognise that his own work was surpassed. He sought another commission for a May gift, which was produced two years afterwards, and is now in the Louvre. The subject is the *Stoning of St. Stephen*. But his rival was not to be tempted to a second struggle. There were, however, other people who were not disposed to allow the competition to cease. LAMBERT DE THORIGNY, who was, as we have related, LE SUEUR's best patron, became desirous to have LE BRUN also employed in the decoration of his house. He assigned to him a large gallery which was to be devoted to sculpture. The subject selected by the painter was the *History of Hercules*. It was one well adapted to his powers, and formed a violent contrast to the reposeful works of LE SUEUR. According to the story, when the work was finished the Pope's Nuncio inspected the mansion. He was charmed with LE SUEUR's work, but all he condescended to say about LE BRUN's was to designate it as *una coglioneria*. The phrase was not merited, for the painting of the *Marriage of Hercules and*

*Hebe* is an effective piece of decoration according to LE BRUN's principles. The artist was wounded by the criticism, and declined to paint any more in the Hôtel Lambert.

If LE SUEUR had lived LE BRUN would have been able to demonstrate that he was the more favoured painter. We cannot imagine that LE SUEUR would have ever charmed LOUIS XIV., for he could not stoop to the representation of His Most Christian Majesty as a sun-god. But competition between the artists shortly afterwards came to an end. LE SUEUR died in 1655 in his thirty-eighth year, while LE BRUN, who was two years younger, lived on to 1690. The elder artist is likely to have shortened his life by his devotion to work, and yet it is doubtful whether he did not die in a state that approached poverty. He has been called the French RAPHAEL, and, although there may be some exaggeration in the title, he comes nearer than any of his countrymen to the Roman master. But the distance between them is wide.

## ELECTRICAL INSTALLATIONS.

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Continued from last week.)

### DYNAMOS.

*Theory*.—The dynamo is a very efficient machine for converting mechanical into electrical energy, this efficiency often being 95 per cent. in large machines. The conversion is effected by the action of a magnet on a coil or coils (discovered by FARADAY).

If one pole of a magnet is plunged into the centre of a coil of wire, although there may be no actual contact between the magnet and the coil, an electromotive force is generated, and if the circuit is complete a current will flow in one direction. When the pole is withdrawn a current is generated in the opposite direction. It can be demonstrated that the amount of work done by the electric current so generated is the same as that required to insert or to draw out the magnet. Thus this machine is a most elementary form of dynamo. The same effect can be obtained if a coil wound on part of a magnetic circuit is rotated in such a manner that the magnetic induction through it is continually being varied, and this is the form of a dynamo.

The two-pole machine consists of a heavy iron forging or casting made of a U shape, or inverted. On the limbs are wound coils of copper wire, which will convert the soft iron into an extremely powerful magnet if a suitable current is passed through them. The ends of the limbs of the magnet are made solid, and are accurately bored out so that a circular mass of iron can be rotated between the poles, thus almost completing the magnetic circuit. This mass of iron called the armature is of various forms—ring, disc, or drum—and is wound with coils of wire in such a manner that each coil is, as it were, pierced by the magnetism twice in every revolution; thus the induction passes through it in each direction once in every revolution, and this is equivalent to continually plunging the magnet into and drawing it out of the coil.

The important point is that the wire must be wound longitudinally along the axis or parallel to the axis of the coil, as this complies with the condition that the magnetic induction shall be cut by the coil. The voltage or electromotive force which the dynamo will generate is proportional to the number of magnetic lines (a measure of the strength) of force, the number of times in each second that each individual line is cut by any one conductor on the surface of the armature, and to the number of conductors on its periphery.

Now it is evident that, as above explained, if the two ends of the coil were connected to two insulated rings attached to the armature shaft, the current collected from them would reverse twice in each revolution. To convert this current, which is alternating, into a continuous one, a mechanical device called a commutator is employed. The commutator, which is fixed to the shaft, consists essentially of a tube, split axially into two semicircular pieces which are insulated from each other and the shaft, each end of

the coil being connected to a segment. Two metal strips or brushes, which collect the current, rub on this commutator on opposite sides, and are placed in such a position relatively to the magnetic induction or field that when the one half of the commutator is disconnected from one of the brushes and connected to the other, the pressure in the coil is just reversing.

The current from such a machine will always flow in one direction, but it will rise and fall from nothing to a maximum twice in every revolution. Suppose the dynamo to make 1,000 revolutions per minute, there would be 2,000 pulsations per minute; this would be almost noticeable for lighting.

To obtain a practically steady current, the commutator consists of a large number of segments, each connected to a closed coil of the armature; the effect of this is that the pulsations are rendered more frequent, and are of less amount proportionally.

Dynamos have usually from 50 to 100 segments on the commutators, and the higher the voltage the more segments are required to insure sparkless collection of the current.

*The Magnetic Circuit.*—A magnet may be made by passing a current through a coil of wire which surrounds the iron to be magnetised. This method is used in a dynamo, as already mentioned. If a few turns of thick wire are used, a heavier current must be employed than if many turns of thin wire are used. The important point is that the current in amperes, multiplied by the number of turns of wire must be a given amount to produce a given induction in the magnetic system. It follows that for this number of ampere turns, given the same voltage on the terminals, you may decrease the current indefinitely by increasing the turns of the same gauge, remembering that the current multiplied by the turns must be constant. The effect of this is to increase the weight of copper, and consequently the expense.

*Magnet Windings.*—A series dynamo is one in which the magnetism is supplied by a coil of wire carrying the main current. The result of this is, that the stronger the current the higher the voltage (within limits), the speed being constant, because the magnetism increases as the ampere-turns increase until the magnets become saturated or fully magnetised.

A series dynamo uses the whole of the current generated by the armature and only takes up a part of the pressure. In any case, taking a series machine and converting it into a shunt by altering the magnet windings, the power used in exciting the magnets would be the same for a given maximum output, *i.e.* the ampere-turns would be constant.

The characteristic of a series-wound machine is that the voltage will increase as the current in the circuit increases, given constant speed. This rise in voltage is very rapid until the current has attained a fair amount, and afterwards it increases less rapidly. This less increase is due to the magnets becoming saturated, and so requiring a much larger increase of current to increase the magnetic induction by an equal amount.

This is only true when there is very little armature reaction, *i.e.* when the field magnets are strong compared with magnetism caused by the armature, so that the armature currents have little power to oppose and reduce the field and so lower the voltage.

A shunt dynamo is one which is excited by a coil of fine wire having many turns, which is connected to the brushes. Thus a small amount of current generated by the armature is used at the full voltage to excite the magnets.

The characteristic of a shunt-wound machine is that the slightest drop of voltage due to resistance of the armature causes less current to go through the magnet coil; the effect of the armature reaction also reduces the magnetism, consequently the voltage of the dynamo falls still more. There is a certain current at which this state of things becomes unstable, and the current and voltage fall rapidly to nothing; thus a shunt dynamo protects itself against short circuits.

A combination of the two windings, the compound, is very frequently used, and it can be arranged that the voltage can be kept constant, assuming constant speed as the current increases; the latter is accomplished by winding rather more series turns than are required to overcome the drop in current of the shunt turns or circuit, and

is called "over-compounding." These over-compounded machines are used to a large extent for private installations and in places where one dynamo only is used, as they automatically regulate for the drop in the mains, &c., as the load increases.

*Sparking on Commutators.*—This subject is a difficult one to explain in a small space, but the cause of sparking may be briefly said to be due to the attempt of the commutator to force a coil (whose commutator segment is just leaving the brush) round which current has been flowing in one direction to receive current in the opposite direction. This coil has electrical inertia or self-induction, and will not respond to the action of the commutator, consequently the circuit virtually becomes broken, and the main current sparks from the commutator segment to the brush, being unable to make the polarity of the coil reverse immediately. The current in this coil is rather heavy, and usually much heavier than the main current, as the coil has been short-circuited under the brush, and so this effect is worse if the brushes are at right angles to the field magnetism.

The forced reversal of the current the moment the segment leaves the brush is the difficulty, and it is overcome in the following way:—The brushes are given a lead, *i.e.* they are set forward a little in the direction of rotation of the armature. When this is done, the current in the short circuited coil has been reversed by the action of the magnet, and, consequently, assists the other coils to deliver their current to the commutator. The result is that there is no tendency to spark, as the current can go through the coil much easier than through the air gap.

If the above were the only cause of sparking the matter would be unimportant, as the brushes need only be set forward a very little as the current from the armature increases, in order to allow the coil to be commuted to have a larger reverse current to assist the larger main current. The angle through which the brush must be moved is greater than the one necessary to accomplish this owing to the armature reaction. The magnetism of the armature core tends to be oblique to that in the field magnet, consequently it opposes and contorts the field, and the effect is to strengthen the points of the poles the conductors are leaving, and to weaken the ones the conductors are approaching. For this reason the brush must be shifted round further than would be necessary if there were no armature reaction, in order that the coils be commuted in the reverse field of requisite strength.

If the position of the brush is not altered into the sparkless condition the commutator will be damaged by the sparks, and each segment will have its edge burnt off, and continuous sparking, or arcing, will be the result, owing to the uneven nature of the surface and the vibration of the brush. The result of moving forward the point of commutation in front of the plane at right angles to the lead is to reduce the voltage of the dynamo. This is caused by the fact that some of the coils must oppose the main current, as already explained, before they come under the brush, in order that sparkless collection may result. This is, as it were, the price that is paid for sparkless collection, as a larger dynamo is required to give the same output as that which could be obtained if sparks could be otherwise prevented, and the maximum power of a dynamo, given a reasonable drop of pressure, is usually limited by the angle of rocking, rather than the heating of the coils. Modern machines are made so that the sparking is negligible, and the brush-holder requires very little rocking.

The usual method adopted to keep this arc of rocking within reasonable limits is to make the field magnet coils very powerful in comparison to the armature reaction, so that the distribution and amount of magnetism is little affected. This can be done by (1) making the field very strong; (2) by slotting the magnet pole-pieces axially, and so making a number of air gaps in the armature field, thus opposing the cross-magnetising effect; (3) by making a large air gap; (4) by winding series coils on the pole-pieces so that they neutralise the armature reaction.

The first method makes the machine heavy, because the magnet is so large; the second is costly, because of the labour necessitated; the third method is very satisfactory as regards prevention of sparking, but it sacrifices efficiency or lightness to effect this. The fourth method has not been used very much as yet, and, in fact, has not long been

suggested, but the labour entailed to carry it out would certainly be considerable. In fact, each and every method suggested means either decreased efficiency or an increased expense.

*Carbon Brushes.*—Carbon brushes have been found to stop sparking to a large extent, and the reason for this is that the contact between a metal and carbon is of high resistance compared with that of the coil; consequently when the segment is leaving the brush the surface of contact becomes small, and therefore the resistance is high and increasing. Thus the current flowing through the segment leaving the brush is reduced greatly, and is practically nothing at the moment of leaving; hence practically sparkless collection. Also, as the resistance of the brush contact is high, the short circuit current is kept low and affects the problem very little, and for this reason the lead of the brush does not affect the importance of these currents; consequently the brushes are usually fixed in one position, especially in motors.

There are several points to consider in the use of these brushes, and one is that carbon is a bad conductor, especially at contacts, and the very reason which makes them sparkless for brushes may cause serious heating at the point of contact between the commutator and the brush, and brush and holder. Ample surface must be allowed at the latter contact, and the brushes are usually copper-plated at their ends for this purpose. The reasons that these brushes are not used more are that they require a considerable amount of fitting to run well, as they must be filed to the curve of the armature; also they are never completely sparkless; the resistance of the contact which reduces the short circuit current naturally makes a greater angle of lead necessary to get a reverse current of requisite amount to prevent sparking entirely. The great excellence attained with ordinary brushes makes it preferable to use them, except when one has a very bad machine. It is in the latter case that they are most suitable and often absolutely necessary.

*Mechanical Sources of Sparking.*—Much trouble is experienced from sparking which cannot be cured by altering the lead of the brushes. It may be taken that if when new the machine does not spark when the load is varied, any sparking which may afterwards occur is not due to original bad design, but to something which has developed later. That being so, it will be of interest to enumerate the causes and give the remedies of such sparking.

1. If there is a periodic spark on both brushes, the spark being once every revolution of the armature on each brush, there is one of two defects. (a) One coil has short-circuited. (b) A wire is broken. If (a) is the fault there will be rather a brighter spark at one position of the commutator, but nothing very serious. The speed will also need to be higher to obtain the usual voltage; a connection to the framework will also be probably found on testing. If (b) is the fault, and the fault is in the armature, the voltage will also be very low, and there will be a violent oscillation of the current and fairly heavy sparking all round. If a commutator segment is disconnected from the armature there will be a spark when the segment comes round, but no fall in voltage. This is assuming that the brush is wider than one segment and the insulation, and is therefore always on two, and sometimes on three, segments.

If one brush sparks and the other does not, it is certain that they are not opposite or that one is dirty. This latter can be easily tested. Calling one brush A and the other B, if A is sparkless and B sparks, then if on moving the brush-holder a position is found such that B is sparkless and A sparks, then it is absolutely certain that it is because they are not opposite. If a position cannot be found where B will not spark, then (1) B may be dirty, (2) the spring adjustment may be slack, (3) the brush may not bed fairly on the commutator. (1) may be found out by changing the brushes, and if the same brush still sparks, it is dirty; (2) can also be discovered by the change, as the other brush will spark if the adjustment is wrong; (3) can be seen by inspection.

If both brushes spark violently and continuously and no neutral point can be found, it is probably due to vibration; the machine should then be examined to ascertain that it is firmly bolted down. The tension of the springs should be altered and the sparking may cease, as

the vibration of the dynamo may be in sympathy with the natural time of vibration of the spring.

A clumsy belt joint may also be the cause of sparking, or it may be caused by a flat on the commutator due to uneven hardness of the commutator segments, or to the edges of the segments being burnt away by careless use. If this is so, the commutator must be turned up again true and smooth.

A badly balanced armature will cause sparking if the bearings have worn much, and the remedy is to refit the bearings, and also to have the armature returned to the makers to be properly balanced.

Finally, a dirty commutator may be the primary cause, and if so, it should be cleaned with emery, the brushes being removed, and only a very little vaseline allowed in future.

#### MECHANICAL DETAILS.

*Armature.*—The conductors on the periphery of the armature have a great tendency to fly off, and consequently they are always bound round tightly by means of steel or phosphor-bronze wire. The strain on these wires is often heavy, and the conductors have been known to fly out from the iron core. This can be prevented by adopting a winding in which the conductors are threaded through holes in the core.

There is no necessity here to go into the matter of armature windings and the end connections, &c.; this will be found in standard text-books on the subject.

*Commutator.*—The commutator is the portion of a machine which has the most wear, and great attention has to be paid to it. The brushes will grind the commutator away very soon if it is made of unsuitable material. Phosphor-bronze has a good name for wear, combined with conductivity, while hard-drawn copper and gun-metal are used very frequently.

A commutator is made up, as before described, of a great number of segments, insulated from each other by means of mica generally. The usual method of fixing them is by means of two insulating bushes having tongues, which fit into grooves on each of the segments. These bushes are clamped tightly on each end of the commutator by nuts and washers, and fixed to the shaft. The connections from the armature are fixed to each of the commutator segments or bars mechanically, and are then soldered to insure a good mechanical connection.

*Bearings and Lubrication.*—The lubrication of high-speed machinery is a very different problem from that of the lubrication of ordinary shafting, especially as the weights supported are very large, while the speed is high. The bearings must be long, at least three times the diameter of the shaft, and a thinner kind of lubricating oil should be used than for ordinary bearings.

When a dynamo is belt or rope driven it will always be advisable to have a bearing on each side of the pulley in a machine of large size. The wear on the bearings will be much more even, and there will be less liability for them to run hot.

There are three general methods of lubricating bearings:—(1) To let the oil run in; (2) to lubricate under pressure and circulate a large quantity of oil many times over; (3) to lift up the oil from a reservoir by means of oil rings.

The first method is so well known that it needs no comment, except to state that it is not satisfactory for dynamos.

(2) Lubrication under pressure is being adopted very extensively, and is quite automatic in many designs. A small force-pump is often used, worked by an eccentric on the shaft, with an oil circulating tank fixed to the bed-plate, or the oil reservoir may be contained in the standards. These arrangements work very satisfactorily, especially if grit is kept from the oil.

If the oil is clear when put in the tank then there is very little chance of grit entering it, as everything is enclosed. It is always advisable to have ordinary lubricators on the bearings as well as the force-pump, in case the pump ceases to work.

The ring oiling is quite reliable, and is very satisfactory for small machines. Two or more rings which are usually about twice the diameter of the shaft, hang on the shaft, and work in grooves. The rings dip into oil chambers, and as they are rotated by the shaft they constantly lift up the

oil and pour it over the shaft, and a continuous lubrication is obtained.

#### CHOICE OF A DYNAMO.

The points which should be considered are:—

1. High efficiency. 2. A good commutator. Sparkless collection when the brush-holder is rocked through as small an angle as possible from nothing to full load. This angle should never be more than 5 degrees. 3. Capability of sustaining the full load continuously for twenty-four hours with a rise of temperature of, say, less than 70 degrees Fahr. above that of the surrounding air. 4. Capability of taking, say, 25 per cent. overload for some hours without undue heating or sparking. 5. Sound mechanical construction, freedom from vibration, hot bearings, &c. 6. Good insulation of armature coils (mica preferred), and magnet coils. 7. A well-designed brush-holder, with adjustable pressure for brushes while running. 8. If a shunt-wound dynamo, a small increase in speed to give full voltage at full load. The actual limits allowable in 2, 3, and 4 will vary according to circumstances, price proposed to be paid, &c.

These points must be compared before a tender is accepted on the mere score of cost, and a guarantee as to points 1, 2, 3, and 4 should always be obtained.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of the Edinburgh Association was held on the 17th inst., the president, Dr. Rowand Anderson, in the chair. After preliminary business, Mr. David J. Vallance, curator of the Museum of Science and Art, delivered a lecture on "Decorative Woodwork," chiefly taken from the Peyre collection recently acquired by the nation. The lecture for the most part was devoted to an exposition and exhibition by means of lantern photos of the collection of French woodwork recently acquired from M. Emile Peyre, of Paris. The sum paid was 9,328*l.* 16*s.* 9*d.* For a number of years M. Peyre's collection, of which the woodwork is only a small part, had been known to several of the authorities at South Kensington, who were interested in it with a view to the purchase of a portion of it. M. Peyre for years held out against selling his collection otherwise than *en bloc*, and it was only after protracted negotiations that he agreed to dispose of a select portion of it, viz. the woodwork now under consideration, which became the property of the nation in 1895, and was in that year brought from Paris and placed under the care of the Science and Art Department. By a fortunate arrangement which enables Edinburgh and Dublin to share in such important additions to the art treasures of the nation as are conveniently divisible, the Edinburgh Museum paid 1,300*l.* of the purchase price and Dublin a similar sum, each museum receiving an equivalent share of the specimens, while the remainder found a home at South Kensington. The addition of a share of the Peyre collection to the furniture and woodwork in the Edinburgh Museum coincided, fortunately, with a structural change in the interior of the building, for this change has provided a suitable place for the display in collected form of all the decorative woodwork. At the north-east corner of the museum there was, until recently, a hall which for many years has scarcely ever been used for the primary purpose for which it was designed. For many years it has been practically closed to the public. Some time ago the director, Sir Robert Murdoch Smith, in view of the growth of the collections and of the certain necessity of their requiring at no distant day rearrangement and separation into sections, determined to make an effort to have this long-closed hall put into such condition that its area might be added to the exhibition space of the museum. His efforts were eventually successful. A floor of concrete, supported by iron girders and pillars, was laid and tiled on a level with, and in the same manner as, the rest of the museum. The space below this floor forms an ample apartment for unpacking and storage, and to add to its convenience a large door has been broken through the wall facing West College Street. This alteration, which has been in progress for several months under the charge of Her Majesty's Office of Works, has only now been completed, and the result is surprisingly successful. Instead of the closed doors and blank wall which formerly met one at this part of the museum, an open floor stretches to the extreme corner of the building and the visitor can wander at will till a windowed wall and a view into Chambers Street show him he has reached its furthest limit. This alteration adds considerably to the floor space available for exhibition purposes, but it does more; for the feeling of lightness and openness which it has brought to this part of the building seems to add much more to its spaciousness and extent than the actual measurement of the addition would have led one to expect. The new hall when it is opened to the public will be devoted to

the display of the collection of furniture and woodwork in the museum, and it was to a few of the specimens that would find a place there that Mr. Vallance directed attention. The lecturer then proceeded to show a number of illustrations of decorative woodwork taken from the Peyre collection, arranged so as to show the changes of style from the Gothic days of the fifteenth century on to the modern decoration of the Regency and Louis XV.'s time. At the close of the lecture a complete set of hand photographs of the whole Peyre collection was laid on the table for further inspection by the audience, and it was intimated that these photographs might be consulted or drawn from at the museum. A vote of thanks was given to the lecturer.

#### THE CARNEGIE MUSEUM, DUNFERMLINE.

THE old tower at the Pends which, through the generosity of Mr. Andrew Carnegie of New York, has been converted into a museum, has been formally handed over to the managing committee of the Dunfermline Museum and Archaeological Society by Mr. Hawks of Her Majesty's Office of Works, Edinburgh. The museum, says the *Press*, has been constructed for the purpose of preserving articles of interest connected with the old monastery and abbey, but it serves perhaps a more important purpose, and that is the preservation of the historic building itself. For many years the lower portion of the tower was used by the superintendent of the churchyard as a tool-house, and a complete transformation has been effected. The floors of the four apartments have been laid with small squares of Arbroath pavement and the windows filled in with stained-glass. Doors of solid oak have been provided, and a staircase also of solid oak leads from the lower to the upper room. The latter is the museum proper. It is 26 feet by 16 in size. The north window is filled in with cathedral glass, with the town's arms and motto in the centre. The south window displays the Royal Scottish Lion and motto. Mr. Carnegie's initials appear in the staircase window. It is interesting to note that the old kitchen grate of the palace has already found a place in the museum near the spot it occupied originally.

#### A GERMAN VIEW OF BRITISH ART.

THE Berlin correspondent of the *Standard* says:—The official organ of the Ministry of Public Works has published an extremely interesting article by Herr Maethaesus, Technical Attaché to the German Embassy in London, on "William Morris and the Fifth Exhibition of Industrial Art." It contains the following remarks:—"The exhibition shows the art industry in England at a stage which can only be regarded as the result of decades of earnest endeavour. Great progress has also been made during the last twenty years in other countries, and the need has made itself universally felt of arresting the grievous decline of German handicraft which set in with the classical revolution at the end of last century, and which, by the middle of the present century, had become intolerable. A return to old traditions has been eagerly sought everywhere. What, however, distinguishes England from other countries is the new and independent spirit she displays. Absolutely novel forms have been found, and the resulting ornamentation shows real creative power. England has entered on new and successful paths, while we others have hitherto contented ourselves with copying our old masters. We ought to have learned from this that mere imitation of other phases of development can never satisfy us permanently, and this very experience should restrain us from all idea of now simply adopting English achievements. What the best artists there have attained by the sweat of their brow belongs to them alone, and we shall never be able to look upon it as our property. It does not accord either with our true inner taste in any respect, and if only for this reason will never have with us more than the importance of a passing fashion. Further successful development can only be looked for if lines are followed which correspond with our national character, and through our own energetic labours, just as the leading English artists have cultivated only what their nation sympathises with. Other circumstances have, it is true, also contributed to the gratifying results the latter have in this way arrived at. Thanks to the undisturbed political and economical development which the country has enjoyed for over two centuries, forces have grown up in England which have prepared most favourable ground for endeavours such as the foregoing. These forces are chiefly the wealth of the country and the healthy domestic spirit of its inhabitants. The latter attribute is especially conspicuous in England, and redounds to the credit of the nation. An excessive influx of wealth generally brings with it, in the history of nations, a corruption of morals. The morals of England have remained comparatively clean; the cultivation of domestic life, and the preference for resi-

dence in the country, which animate even the rich, and the rich most of all, are nowhere more in evidence. In my opinion it is in this healthy fostering of domestic life, united with the existing wealth, that the conditions are to be found which are responsible for the success of industrial art. Although a strongly-developed love of home may create a desire to beautify the daily surroundings in the house by means of art, this wish can only be realised if the necessary means are forthcoming. 'Le superflu, c'est une chose très nécessaire,' says a French proverb. It is only when considerations of cost no longer play the first rôle in the household that an active cultivation of domestic art is possible. Then only are the manufacturers placed in a position to invite the first artists to prepare the designs for their productions. This has been the case in England to an abundant extent. The best artists are employed on industrial art designs, and a number of them—among them William Morris and Walter Crane—have made this the principal end of their life's work. Art and handicraft have here entered into a real confraternity, and we shall have to wait for a similar movement on our part before any striking results can be looked for."

### THE NATIONAL PORTRAIT GALLERY.

THE following acquisitions have been made recently by the trustees of the National Portrait Gallery, and will be exhibited to the public as soon as place can be found for them in the galleries.

By presentation:—

William Morris, poet and decorative artist, painted in 1880 by G. F. Watts, R.A., and presented by the artist in continuation of his former gift.

Coventry Kersey Dighton Patmore, poet, painted in 1894 by Mr. Sergeant and presented by Mrs. Patmore; accepted by the trustees, in spite of the recent event of Mr. Patmore's death, both on account of Mr. Patmore's high position in English literature and the merits of the portrait as a work of art.

John William Colenso, D.D., Bishop of Natal, painted in 1866 by Samuel Sidley and presented by the artist's son.

Amelia Opie, modelled in 1829 by P. J. David d'Angers and Sir John Bowring, modelled by the same in 1832—two bronze medallions, presented by the director.

By purchase:—

Thomas Cromwell, Earl of Essex, K.G., an early painting of the school of Holbein.

Adam, First Viscount Duncan, the victor of Camperdown, painted by H. P. Danloux.

Harriet Martineau, painted in 1834 by R. Evans.

Henry Fawcett, the original model in plaster for the alto-relievo portrait executed by Miss Mary Grant for the memorial fountain on the Thames Embankment.

Sir Francis Grant, P.R.A., and Charles Stewart Parnell—original casts from busts executed by Miss Mary Grant.

John Tradescant, the younger, who with his father owned the physic garden and museum in Lambeth known as "Tradescant's Ark," the rarities in which were given by him to Elias Ashmole, and form the nucleus of the Ashmolean Museum at Oxford; a painting attributed to William Dobson.

Thomas Cartwright, Bishop of Chester and High Commissioner for Ecclesiastical Causes under James II.; painted by Gerard Soest.

William Chaffinch, the notorious "backstairs" courtier and servant of Charles II.; painted by John Riley.

Sir Henry Sydney, K.G., Lord Deputy of Ireland, and father of Sir Philip Sydney and Mary, Countess of Pembroke; a contemporary portrait, artist unknown.

The trustees of the National Portrait Gallery give notice that the gallery will be open to the public on Sunday afternoons from 2.30 to 5.30 P.M. from Sunday, April 4, to Sunday, September 26 inclusive.

### THE COCKBURN ASSOCIATION.

THE annual report of the Cockburn Association states that during 1896 the attitude of the public towards questions affecting the amenity of the city of Edinburgh was well illustrated in connection with the discussion of sites for the Usher Town Hall, the intense and universal interest in that question contrasting strongly with the general apathy exhibited in other important matters, such as the threatened loss of the view of Edinburgh from the Arboretum, the threatened mischief to the surroundings of Holyrood Palace by the feuing of Croft-an-Righ, and the building operations now in contemplation at the Castle. The report says:—"No ordinary town could purchase with all its wealth what was at stake in the two first of these cases, or what still is at stake in the last. But the public seemed indifferent when the Town Council purchased the ground adjoining the Arboretum, and so preserved the distant view of the city, and before the Government acquired the ground called Croft-an-Righ, for the preservation of the surroundings of Holyrood, the

public maintained the same attitude of indifference as they now do while the War Office matures its plans for alterations to the buildings on the Castle Rock. No general interest in the distinctive beauties of the town for their own sake seems to exist. One of the original ambitions of the Association was the development of such an interest, but this ambition has only partially been realised. Great progress has, however, been made since the Association was founded in 1875, and the excitement caused by Mr. Usher's gift, though really due to quite other causes, should indirectly help forward the work." The report then goes on to say that "one of the most crying evils on the large scale in Edinburgh is the spread westward of dreary wastes of masonry, unrelieved by open spaces. The new town that is now rising up in the direction of Dalry spreads much on the lines of the old country roads and cross-roads, without definite plan and without open spaces." The following occurs in the reference to the Usher Town Hall:—"Mr. Usher's gift of 100,000*l.* to Edinburgh to enable the citizens to build a town hall is, from the point of view from which the Association must approach civic affairs, one of the most welcome and interesting events which has occurred within recent years. The legitimate influence exercised by the Association is, in this connection, shown by the fact that the site which had been authoritatively declared to be "on all grounds, practical and æsthetic, the best that can be got, unless at an enormous expense," has not again been seriously discussed in public since, by the intervention of the Association, the three letters printed in Appendix A (those written by Sir Noel Paton, Sir George Reid and Professor Baldwin Brown) were, through the courtesy of the Press, communicated to the public." The report afterwards details a number of points touching the amenity of Edinburgh and vicinity, to which the Association has given attention in the course of the year.

### FIGURES ON CHANCEL SCREENS.

AT a sitting of the Consistory Court of St. Albans, held on February 19 last, application was made for the grant of a faculty in respect of certain figures which it was desired to erect on the chancel screen of Holy Trinity Church, Great Bardfield, Essex. The application was unopposed, but, owing to the importance of the question raised by it, the Chancellor, Mr. A. B. Kempe, took time to consider his decision, which was pronounced at a court held on Thursday, March 18. The Chancellor said that in this case an application had been made to the Court to decree the grant of a faculty authorising the vicar and churchwardens of the parish of Great Bardfield to restore the chancel screen of the parish church by placing three figures upon it. The application was unopposed, and the parishioners in vestry assembled had unanimously expressed their approval of what was proposed to be done. In the absence of figures on the pedestals, the screen unquestionably presented a maimed appearance. From his own inspection of the church and from the evidence of the vicar, he was satisfied that there was nothing whatever in the building and would be nothing in the services which would in any way conduce to the figures being regarded as objects of superstitious reverence. The Court had not in this case to deal with the general question whether, in the absence of such special circumstances as here existed, the erection upon a chancel screen of a figure of the crucified Saviour with the accompanying figures of the Blessed Virgin and St. John ought to be sanctioned. In the determination of that question there were, as it seemed to him, two opposing considerations which would require to be most carefully weighed. On the one hand, it would appear to be most material to bear in mind that, while the Church of England before the Reformation not merely sanctioned, but, as pointed out in "*Clifton v. Ridsdale*," actually enjoined the adoration of the crucifix—a practice to which the Church of Rome still adhered—in the Church of England any such "superstitious reverence" was now, and for over 300 years had been, regarded as "a fond thing vainly invented, and founded upon no warranty of Scripture, but rather repugnant to the Word of God"; so that any practices or preaching on the part of the clergy which would tend to the encouragement of such superstitious reverence would be contrary to law. In view of this attitude of the Church, it would seem clear that in the absence of any practices or environment conducive to the payment of such superstitious reverence, or indicating the likelihood of its existence, the probability of its now being paid was not lightly to be assumed. Under the special circumstances of the case before him—and it was with that case alone that he had to deal—he could not consider that those circumstances would justify a judicial decision that there was ground for such a just and reasonable apprehension of abuse or superstitious reverence as ought to lead him to declare that these figures would not be lawful. There would be a decree that a faculty was to be granted for the erection upon the three pedestals of three stone figures, without gilding or painting, in accordance with the design deposited with the petition.

## NOTES AND COMMENTS.

WHEN LOUIS XIV. gave an architectural commission to Dr. PERRAULT, who was thereby transformed from a *méchant médecin* to a *bon architecte*, His Majesty could not have realised how much wrong was to follow. The putting of square men into round holes, and *vice versa*, was henceforth to become common in Governmental departments. The factory at Sèvres is a notorious example of the consequence of the system which LOUIS XIV. initiated. An inventory of the various directors would be enough to suggest that, as every man is made of clay, in like manner we are all born potters. Why, for example, should M. CHAPLAIN, who is one of the few great medallists of modern times, be compelled to accept an office for which he did not possess the requisite experience or the desired aptitudes? He bravely held his post for a year, but at the end of that term he was exhausted, and was compelled to resign. The Government apparently have determined to make compensation for the PERRAULT precedent, and have appointed M. SAUDIER, who is an architect. We hope he will remain longer in office than some of his recent predecessors, for every change in the directorship causes expense as well as inconvenience. Generally the first exercise of power is displayed in making costly changes. Meanwhile, the potters and artists are in revolt. They see in their various masters proofs of the indifference of the Government, and who can wonder if they also conclude that the old royal factory is on its last legs?

A PAPER on "Blue Lias Lime," which was lately read by Mr. H. J. HARDING before the Clerks of Works Association, has been published in pamphlet form (SPOTTISWOODE & Co.), and will therefore be more accessible to architects and contractors. The author rightly insists on the term "blue lias" being restricted to lower beds of the liassic series, for, unfortunately, various artificial mixtures are passed off on the public as the genuine product. If such a clause as the following, which is taken from a specification for waterworks, were generally adopted, there would be no risk of failure:—"The whole of the lime shall be thoroughly and uniformly burnt by some firm or firms of good repute from the best hydraulic limestone of the lias formation, and shall be free from overburnt lime or any impurity, and such lime shall in no case be inferior to the best blue lias lime burnt by Messrs. GREAVES, BULL & LAKIN, of Warwick." In the clause a precise standard is fixed, having a value which all would recognise, and therefore any departure from it can at once be brought home to defaulters. Another means of insuring genuine blue lias lime is to insist on having bags marked with the registered trade mark of firms of good repute. Firms of that class would, of course, in their own interest endeavour to aid in the prosecution of dealers who supply compounds that will endanger the stability of any building or other structure in which they are used. There are many suggestions in Mr. HARDING's paper which merit the attention of every one who has to employ blue lias lime.

WE suppose no modern Pope would care to have his name associated, however remotely, with ALEXANDER VI., and on that account the rooms forming the Appartamento Borgia added by him to the Vatican were kept closed for a couple of centuries. But it is hard that the fame of PINTURICCHIO as a wall-painter should be obscured because he received a commission from a pontiff who was neither of the primitive nor of the modern type. In justice to the artist, LEO XIII. ordered restoration to be undertaken. The paintings in the first or guard room are too defaced for reparation. Accordingly the walls have been covered by tapestry of the fifteenth century. In the second room, what remains of PINTURICCHIO's work has been preserved untouched, but an attempt has been made to fill up the spaces from which his work has vanished by paintings in his style on canvas. Intarsia panelling, by GIOVANNI DA DOLCI, has been placed in the third room. In the fourth room, says the Vatican correspondent of the *Times*, the old pavement has been reproduced by Professor RITROSI. This pavement is of a very beautiful design, which has been admirably carried out. A few fragments of what remained of the original floor have been placed on one of the walls.

fine chimneypiece by SANSOVINO, formerly in the first room, has been placed here. The fifth room has a new design on the walls done by Professor MORANI. The old pavement has been reproduced. In the sixth room, where the walls had no decoration before, a new design in harmony with the period has been made by Professor FRENGUELLI. An arch which formerly divided this room was removed by Count VESPIGNANI. This was a most difficult matter, and it was successfully carried out. Count VESPIGNANI has had the control of the whole work as architect, and under him the well-known Professor CAVALIERE SEITZ has been charged with the supervision and direction of it. The work of restoration has been done by Professors RITROSI, MORANI and CINGOLANI. The pavements were executed partly by the Museo Industriale of Naples and partly by Cantogalli, of Florence. The restoration of this famous apartment has been carried out in a thoroughly conservative manner. Nothing has been destroyed and only repairs, absolutely necessary have been allowed.

ALTHOUGH subways are not so generally constructed in London as in some other cities, it appears that beneath the City streets, and under the control of the Commissioners of Sewers, there exist at the present time about 2,360 yards, or nearly  $1\frac{1}{2}$  mile of subways. The lengths of gas, water and hydraulic mains, and telegraphic, telephone, pneumatic tubes, and electric lighting conduits, laid in these subways amount to a total of  $7\frac{1}{2}$  miles. Access under proper supervision is given to the officers and workmen of the various companies. The inspector in charge reports that 4,717 workmen and others were admitted during the past year for various purposes. The usefulness of these subways is evidenced by the fact that in the streets beneath which they have been constructed no openings have been made for access to pipes, &c., except those for taking pipes into the ends of the subways, since they were constructed.

THE proposal to remove Christ Church, Birmingham, which the late GEORGE DAWSON considered to be the ugliest in the country, is again giving rise to much discussion. A Bill to obtain powers is now before Parliament. The site is one of the best to be found in Birmingham, and a Parliamentary committee may ask what class of building is to be erected on it, for the amenity of the Midland city will not be promoted by the substitution of an ugly warehouse for an ugly church. Everyone who has visited Birmingham will agree with the writer of an article in the *Daily Post*, who says: "We do not want to hurt the feelings of architects or owners, but we must say that there are business premises in Birmingham—huge erections, mainly of glass and iron—which ought not, under any circumstances, to be allowed to occupy the site of the doomed church. If any such erections, dominating the open place in front of the Council House, were to be permitted, it would be a scandal, a perpetual source of discredit to public taste, and a reproach to the Commissioners who under this bill are to be entrusted to deal with the site. Whatever building is put up there should be stately in its proportions, suitable in its purposes, and should be designed in accordance with recognised rules of architectural art. In order to secure this result there should, we think, be a controlling or revising power given to some competent public body—say to the City Council, with power to call in experts to advise. We urge this all the more strongly because a good deal has already been done to spoil the immediate neighbourhood from want of such a power as that indicated. If there had been such authority vested in the governing body, we should never have had the grotesque construction which used to do duty for a post-office, nor the remarkable structure which is now used for the same purpose."

## SALISBURY CATHEDRAL.

IT was the fate of each of Mr. PECKSNIFF'S pupils to improve himself during his three or five years' term "in making elevations of Salisbury Cathedral from every possible point of sight." Accordingly, among the treasures of the establishment were many rolls of drawing-paper representing the building from the north, the south, the east, the west, the south-east and the north-west, which exemplified the great development of talent under the Pecksniffian system. To DICKENS and his readers there was comicality in supposing that an English cathedral, and especially one which belonged to so rural a place as Salisbury, was worth so much labour. In 1844 a great many English people who did not read novels would agree with DICKENS. He and others were incompetent to realise that from the peculiarity of its character Salisbury Cathedral could not be delineated to excess, for its details were no less interesting than the general views from various points of sight. The majority of cathedrals have grown, and afford evidence of the process, which was often slow in operation and with long intervals between the stages. Salisbury could hardly have been raised with more expedition in the thirteenth century. If one man did not prepare the plans and direct the whole of the operations, a respect was shown for the designers' intentions which was not common among Mediæval builders. As a revelation of that peculiar unity which is found in Salisbury, there cannot be too many drawings, for the more the building is scrutinised and its parts presented for examination in one's study, the more it appears to have a sort of organic completeness.

As we have already remarked, it is an advantage to see the cathedrals and other buildings of which Englishmen are proud as others see them. In the case of Salisbury we have the conclusions of one of the safest and most learned of French archæologists. We refer to M. VITET, of the Académie Française, who co-operated with PROSPER MÉRIMÉE in directing the operations of the Historic Monuments Commission in France. He was naturally an enthusiast for French work, and the precision which is seen in Salisbury would of course appear to him to be as chilling as English manners. But the merit of every part of the building could not be overlooked by anyone who was devoting his life to the study of Mediæval art. He wrote :—

The cathedral of Salisbury, which the English regard as a type of its class, as the perfection of perfections, is undoubtedly a magnificent building. The proportions of it are grandiose ; the plan is of so simple an ordonnance, so perfect a symmetry, it can be realised by a glance. The façade is beautiful and shows delicacy of ornamentation, with the exception of the doorways, which are poor and suggestive of a village church. The building is surmounted by a spire in stone of a great height and of extraordinary richness ; there is moreover the only tower (clocher) of any importance which is to be found in England. The interior of the building has a regularity which is marvellous, but the coldness of it can hardly be expressed. The defect is owing to the entire absence of every kind of sculpture. Not one stroke of the chisel is to be discovered, nothing which suggests man's hand, nothing that is living or animated. The capitals are all alike, and are composed of two or three simple mouldings, which seem to be produced mechanically or by some turner of the legs of chairs, or they might have been formed of carton-pierre.

It is, however, easy to comprehend why Salisbury should enjoy so immense a reputation. In spite of its imperfections of detail it is, in the first place, one of the grandest and most complete of cathedrals, and then it is a picture of which the interest is increased by the framing. The greater number of English churches have the privilege of being closely united to the green sward, but probably there is not one among them which is shaded by trees so imposing and gigantic as those at Salisbury. On one side we see noble elms and the finest grass, on which the building seems to repose ; on the other a cloister, vast, silent and deserted, but so well kept, so respected, that the monks seem to have only just left it, and, when the office in the cathedral is ended, will resume their perambulations. A combination of the kind cannot be described, but at least the relief, the *éclat* it imparts to the beauties of the cathedral, can be imagined.

On entering the cloister, and following the way under the long line of vaulting, we arrive at a door which leads to a grand octagon, dazzling in its brightness of illumination, and for which we may in vain seek for a model on the Continent. It is the chapter-house. In the centre rises a tall column of

stone—rather it is not a column, but the trunk of a vast palm tree, of which the head bends down like an immense sunshade, and shelters under its symmetrical branches the whole area of the floor, the branches being united with parts of other palms which spring from the angles of the octagon.

It is impossible to imagine anything more gracious, light and majestic than this arrangement of vaulting. The fairies of the Alhambra have produced nothing which surpasses in fantastic elegance these bowers of palms, in which, too, the severest laws of taste can discover no defect, either in the curves or the planning. There is nothing to be seen in France from which a notion can be formed of so delightful an example of decoration. In the art of disposing and ornamenting their vaults it is evident the English are our masters. They have for that work a peculiar aptitude ; it enables them to exercise their imagination and their practical studies, and hence they have produced various effects which are of extraordinary richness ; but among all their inventions they have not one which is more original and more happy than the bower of palms at Salisbury.

M. VITET was a rigorous critic, but he was compelled to surrender himself to the beauty of the work of the Salisbury stonemasons. The objection he raised is very often heard at the present time. The uniform excellence of the cathedral is not a common characteristic of Gothic buildings. Accordingly, it is concluded that it is not in keeping with the style, although in Classic work a variety of degrees would be treated as not worthy of an art like architecture. What gives rise to such objection in our time is the resemblance between the work at Salisbury and modern work which is produced entirely or partially with the aid of machinery. They could not employ labour-saving machines in the thirteenth century, but it is assumed that as the masons who worked at Salisbury were compelled to sacrifice their individuality, they were not much superior to machinery. If more variety were attained in the cathedral, and if the details exhibited occasional roughness in the execution, we suppose the admiration of the building would be less qualified. Fallible men are tolerant of weakness that can no longer cause them the least inconvenience, and, on the other hand, it is not gratifying to know that a degree of perfection was attained six hundred years ago in Salisbury which cannot be easily surpassed in our time. The hesitation to admit the true value of the architecture is, however, only one of the signs of the fastidious discontent of the age. Salisbury Cathedral must be judged by another standard to what is generally applicable, and it would be vain to inquire whether the standard must be higher or lower. In Salisbury we may assume we have one man's design ; as a result there must be differences between it and buildings in which many designers co-operated. The style too is of one period, which had attained a sort of maturity, and therefore must be wanting in some of the graces which belong to infancy and adolescence. There is nothing which can be called tentative at Salisbury, for it becomes evident that every part was determined by principle which might have been expounded beforehand in a written book. Dr. JOHNSON is not credited with the possession of refined taste in judging works of art, but it would be well if some later critics would accept his opinion when he said "Salisbury Cathedral and its neighbour Stonehenge are two eminent monuments of art and rudeness, and may show the first essay and the last perfection in architecture." We may hope that some day evolutionary power will create a type of Gothic compared with which Salisbury will appear rude, but as yet that time seems remote, and meanwhile we may as well enjoy the best examples we are allowed to possess.

It would, however, be an error to believe that dissatisfaction with the excellence of Salisbury is a testimony of the more exact method of criticism which is one of the products of our age. In 1803 we find JOHN CARTER expressing himself reluctantly on the subject in a manner which is entirely modern. He says :—

Salisbury's founder and first architect, if their spirits could have leave to revisit our earth, must have known much felicity in witnessing their general plan carried into execution throughout the whole work—a work which to this day has so well endured. We who bear witness to this see a regular uniform design of one pure style of architecture pervading every part (allowing for a few partial deviations in some of the smaller lines) ; the plinths, dados, heights of windows, parapets, roofs, &c., all running in conformity, one object level with another. Consistency in architecture, as seen on the walls of Salisbury

Cathedral church, is certainly to be admired, as most creditable to the architect who has conformed to those rules laid down in the examples of the Roman and Grecian schools; yet that indescribable delight received from the beautiful irregularity conspicuous on our other cathedrals has also its consistent charm, equal, if not superior, to the squared precepts of regular design.

If Bishop POORE and his architect could have anticipated modern criticism they would not have made many sacrifices to irregularity. They were no more hampered by any restrictions or traditions than a modern architect who has to erect a church as a first step towards the development of a suburban building estate. The site was simply the most eligible spot that was to be found on the bishop's land, and it could not be supposed there was any oratory, church, or building on it in an earlier age to give rise to associations which it was necessary to respect. The cathedral which existed at Old Sarum, and which was about to be abandoned, was an object lesson to the architect. From it he could calculate how much space it was necessary to provide for the requirements of such a diocese, and it exemplified also the necessity of a change in the planning. The old cathedral was placed in the most secure position that could be provided, but the altered circumstances of the thirteenth century no longer

made it imperative to have warriors around; in fact, it was found the protectors were more dangerous to the clerics than were the populace. The plan is, therefore, most interesting, for it is an almost unique example of adaptation to the needs of ritual without any other consideration. If we assume the altar originally stood at the crossing of the eastern transepts, the suitability of the plan will be more apparent than it is under the existing arrangement. Mr. FERGUSSON, in treating the subject, says:—

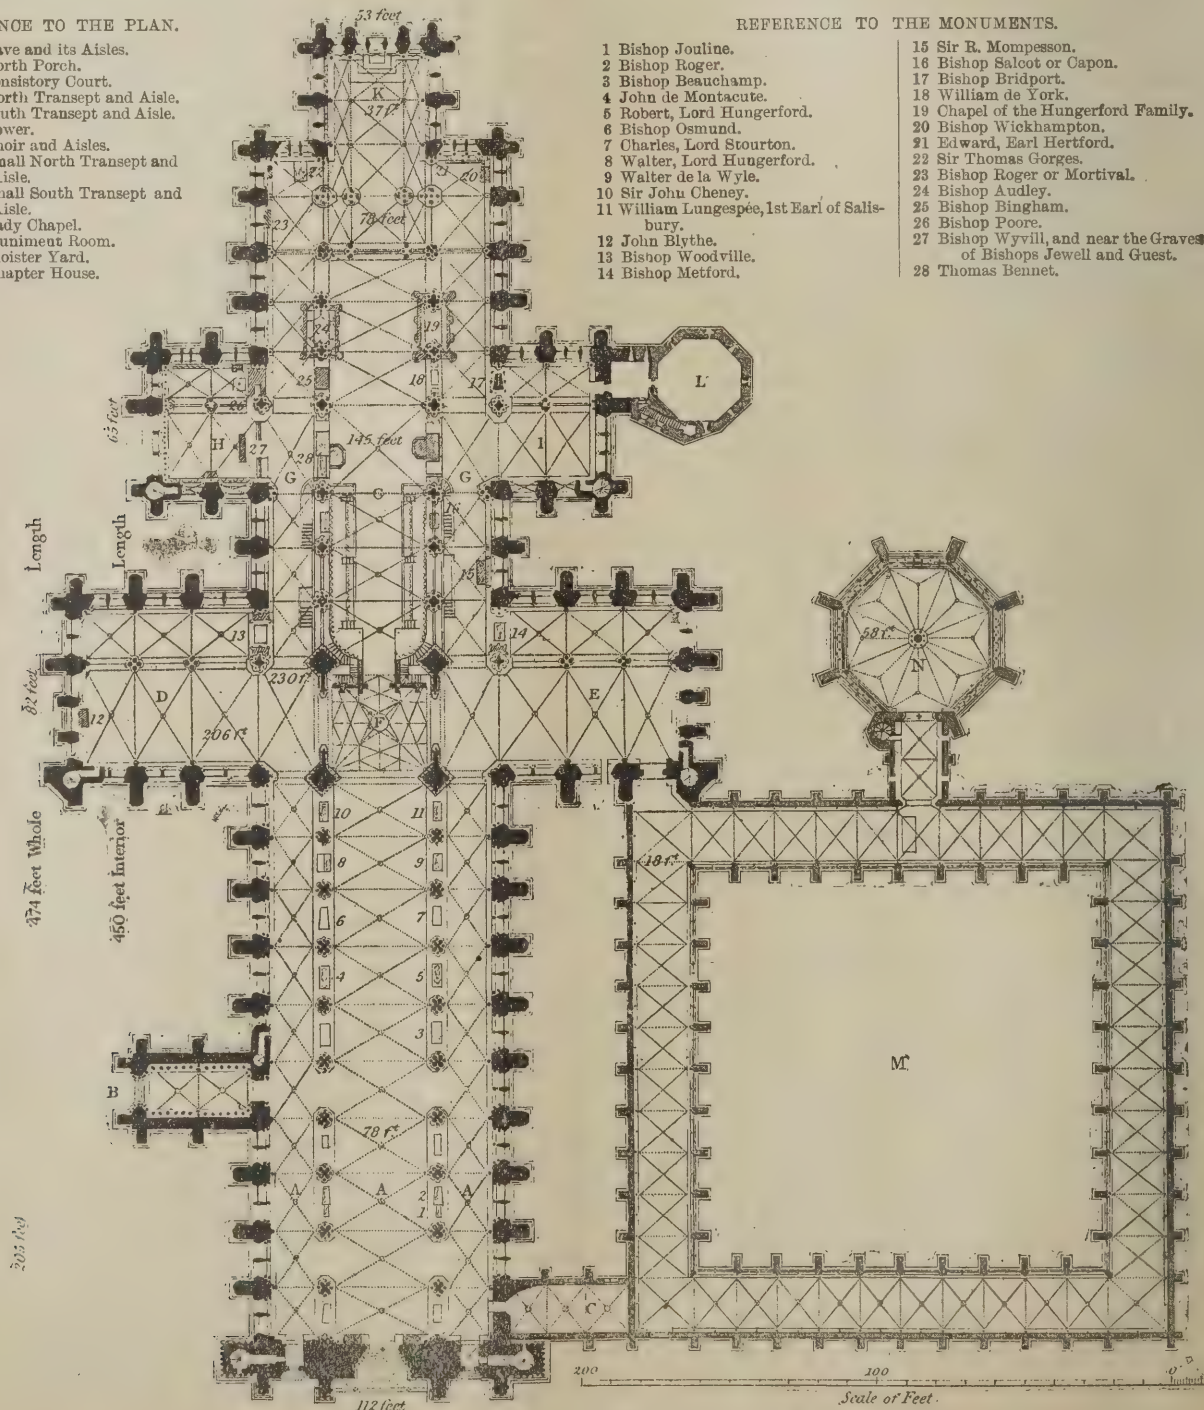

In this church we have a plan not only extremely beautiful, but perfectly original. There is scarcely a trace of French or foreign influence; everything is the result of the native elaboration during the previous century and a half. The internal dimensions, according to Britton, are 450 feet by 78 feet, a little under the English standard, but sufficiently long for effect. The apsidal arrangement so universal in Norman cathedrals has disappeared, never to return, except in Westminster Abbey (1245-69) and in some readjustments, as at Tewkesbury; and the square eastern termination may henceforth be considered as established in this country—the early symbol of that independence which eventually led to the Reformation. Once the Salisbury plan came to be considered the true English type, the Norman cathedrals were gradually modified to assimilate their arrangements to it.

## THE ARCHITECTURAL ASSOCIATION.

AN ordinary meeting of the above Association was held on Friday evening last in the rooms of the Royal Institute of British Architects, Mr. W. H. Seth-Smith, vice-president, in the chair. The minutes of the last meeting having been read and agreed to, Mr. F. Bowles was elected a member.

A vote of thanks was passed to Mr. C. H. Phipps for conducting members on the occasion of the last spring visit, which was to Her Majesty's Theatre.

The Chairman read a letter from Mr. John Belcher, in which he mentioned that a work entitled "Later Renaissance Architecture in England," by Mr. Macartney and himself, was about to be published, and some plates were sent for exhibition at the meeting. It was hoped that the book might correct "the extravagant and excessive use of ornament which has vitiated the public taste of late years, and so promote also an increased regard for proportion and a greater simplicity and refinement of style."

Mr. J. A. Gotch read the following paper :—

## Eighteenth-Century Work.

The eighteenth century saw the final development of that great movement in art which began in the early years of the sixteenth. When mankind had once made up its mind that the masterpieces of Italy were the only examples to be followed, nothing but time and determination were wanted to produce in all the lands of Europe a general sameness of appearance and treatment in every branch of art. In no art was copyism so contagious as in architecture, and in no art was it so injurious. For architecture is essentially a constructional art, a fact which the eighteenth century did not realise, and a fact which wants no little reiteration at the present time, when there seems to be a tendency to neglect construction for the more attractive accessory arts, and to desert the stately queen for her more lively handmaids. A constructional art, to be healthy and natural, must develop from within and not from without.

Architecture in the eighteenth century was the Five Orders and nothing more. An old Roman, called Vitruvius, who had been dead seventeen hundred years, was dictator, and those of his followers who differed from his precepts, although sometimes excused on account of their success, were admonished to be careful how they risked any deviation from the paths of perfection pointed out by him. Gothic architecture was despised and regarded as barbarous. It was not that the votaries of the art preferred a Classic dress to a Gothic; for them the buildings erected in the Middle Ages were not architecture at all. The "Gothick Order," as they called it, is described by one of them as "the Folly and very Ape of Architecture." Such an attitude of mind is hardly intelligible to us who recognise Gothic architecture as at once the most logical and daring form of construction that man has yet employed. It is hardly less difficult to understand how they can have failed to be impressed with the majestic solemnity of a great Gothic cathedral; and yet they did fail—even such cultivated men as Evelyn and Addison. The phrase about the "very Ape of Architecture" occurs in a treatise by a lively Frenchman, M. Freart; and considering the subject, a very entertaining treatise it is. But Evelyn's views were those of a sagacious, unimpassioned Englishman, and are worth quoting at some length as illustrating the standpoint from which the early eighteenth century looked at the subject. In treating of architecture, he says :—

It is the Antient Greek and Roman Architecture only which is here Intended, as most entirely answering all those Perfections requir'd in a Faultless and Accomplish'd Building; such as for so many Ages were so Renowned and Reputed, by the Universal Suffrages of the Civiliz'd World, and would doubtless have still subsisted . . . had not the Goths, Vandals, and other Barbarous Nations Subverted and Demolish'd them . . . Introducing in their stead, a certain Fantastical and Licentious manner of Building, which we have since call'd Modern (or Gothic rather) Congestions of Heavy, Dark, Melancholy and Monkish piles, without any just Proportion, Use or Beauty, compar'd with the truly Antient: So as when we meet with the greatest Industry, and expensive Carving, full of Fret and lamentable Imagery; sparing neither of Pains nor Cost; a Judicious Spectator is rather Distracted and quite Confounded, than touch'd with that Admiration, which results from the true and just Symmetric, regular Proportion, Union and Disposition; Great and Noble manner, which those August and Glorious Fabrics of the Antients still Produce.

It was after the Irruption, and Swarms of those Truculent People from the North . . . when instead of those Beautiful Orders . . . they set up those Slender and Misquine Pillars, or rather bundles of Staves, and other incongruous Props, to support incumbent weights and ponderous Arched Roofs, without Entablature; and tho' not without great Industry . . . nor altogether Naked of Gaudy Sculpture, trite and busy Carvings; 'tis such as rather Gluts the Eye, than Gratifies and Pleases it with any reasonable Satisfaction: For Proof of this (without Travelling far abroad) I dare report my self to any Man of Judgment, and that has the least Taste of Order and Magnificence; If after he has look'd a while upon King Henry the VIIth's Chappel at Westminster; Gaz'd on its Sharp Angles, Jetties, Narrow Lights, lame Statues, Lace and other Cut-work and Crinkle Crinkle; and shall then turn his Eyes on the Banqueting-House

built at White-Hall by Inego Jones after the Antient manner; or on what his Majesties present Surveyor Sir Christopher Wren has lately advanc'd at St. Paul's . . . and compare them judiciously without Partiality and Prejudice; and then Pronounce, which of the two Manners strikes the Understanding as well the Eye with the more Majesty and Solemn Greatness. . . . In this sort have they, and their Followers ever since fill'd, not all Europe alone, but Asia and Africa besides, with Mountains of Stone, vast and Gygantick Buildings indeed; but not Worthy the name of Architecture: Witness . . . what are yet standing at Westminster, Canterbury, Salisbury, Peterborow, Ely, Wells, Beverley, Lincoln, Gloucester, York, Durham, and most Cathedrals and Minsters.

Thus far Evelyn. That Addison had no clearer insight into the nature of architecture will be seen from the 415th *Spectator*, where he says :—

Let any one reflect on the disposition of mind he finds in himself at his first entrance into the Pantheon at Rome, and how the imagination is filled with something great and amazing, and at the same time consider how little, in proportion, he is affected with the inside of a Gothic cathedral, though it be five times larger than the other, which can arise from nothing else but the greatness of the manner in the one and the meanness in the other.

The fact is that architecture to them was, as already said, the five orders and nothing more—to some of them less, indeed, since they only admitted the claims of two out of the five grudgingly and of necessity. Architecture, in their opinion, dealt almost exclusively with the external appearance, and they dismiss in few sentences such considerations as the disposition of rooms. Planning to them meant, first and foremost, the arrangement of their building in regard to its appearance, not in regard to the functions it had to fulfil. Broadly speaking, a well-designed building is as much a product of evolution as natural scenery or the forms of plants and animals. Natural scenery is almost entirely governed by the geological formation of the district. Plants and animals have assumed their various forms chiefly as the result of the necessities of their growth, which, again, are dictated by the functions they have to fulfil. And so it is, or ought to be, with a building. Architecture is not only the art of building finely, it is the art of building finely in order to comply with certain specific conditions.

This notion of architecture was unthought of by the eighteenth century, brilliant though it was, and so the chief aim of its architects was to dazzle and impress the spectator, not to please and satisfy the indweller. Lord Chesterfield told General Wade, for whom the Earl of Burlington had designed an inconvenient though handsome house in Burlington Street, "if he could not live in it to his ease, he had better take a house over against it and look at it;" a piece of advice by which many a nobleman might have profited.

It has been observed that when people take to writing about art they have ceased to practise it to perfection. So long as it is, so to speak, spontaneous, its followers need no directors; it carries them along, they do not force it. But when its natural vitality is spent and its followers are no longer borne unwittingly onwards, then spring up more or less gifted observers, who point out the ancient tracks and show how they may be continued; but unless among them be some who know what kind of force went to the making of the tracks and can kindle the fire to produce the force, all the most accurate and beautiful drawings of those splendid vestigia will not enable one single one to be repeated.

Ever since the beginning of the sixteenth century—that is, for 200 years before our period—Europe had been studying the footsteps of the Romans. For more than half that time England had thrown herself into the pursuit, and now the patient efforts of many writers were to be rewarded, and it was to be the aim of every generous patron and every architect of ability to make our English buildings as much like those of Italy as they could. Architectural design was to be a matter of rule and compass. What could be easier? The text-books gave the proportions, not only of the modern buildings of Italy—or rather the proportions of the Orders which adorned them—but also of some ancient ones upon which the sacred eye of Vitruvius himself must have rested.

Macaulay has observed that during the latter part of the seventeenth century, and the early part of the eighteenth, the heroic couplet was so much in vogue and was brought to such perfection by constant use that every poetaster could employ it with as much facility as Pope himself. So it was in architectural design. The rules were so well known that it required no genius to use them—nobody expected any skill in planning—and so the same dull propriety characterised every building that was put up. Just as in poetry it is not the polished form of the verses that marks the true poet, but the ideas contained in them; so in architecture it is not the correct marshalling of columns and the "nice conduct" of entablatures that must be our criterion, but the manner in which the whole building satisfies and expresses the wants which it is supposed to supply. Judged by this standard, how many of the designs in Campbell's "Vitruvius Britannicus" would come within the category of true architecture? And yet those volumes contain nearly all

the larger houses built in the first half of the eighteenth century. One of his designs Campbell introduces thus, "This design of my invention in the Theatrical stile is most humbly dedicated to Tobiah Jenkyn, Esq." The theatrical style, he tells us, "admits of more gaiety than is proper either for the temple or palatial style," and in that word "theatrical" lies the key to much of the designing of the period. It is all more or less theatrical, done to impress the beholder; just as in the second half of the century the laying-out of gardens and grounds was contrived with the aim of producing the effects found in the pictures of Claude Lorraine and other landscape-painters, down even to the introduction of artificial ruins.

In describing the plan of his house in the theatrical style dedicated to Tobiah Jenkyn, Esq., Campbell dwells not on the convenience of arrangement, not on the cheerful aspect of the rooms or any special contrivance for the comfort of the inhabitants, or whatever goes to make a house a home, but on the proportions of his principal apartments. "Here," says he, "is the double and single cube, the hall being 27 feet by 54 feet. Here is 18 feet by 27 feet, which is the *sesqui altera*, and 21 feet by 28 feet, the *sesqui tertia*, and you pass gradually from the larger to the lesser;" all of which may have satisfied the wants and aspirations of Tobiah Jenkyn, Esq., but do not compensate his descendants for the absence of those arrangements which make daily life tolerable.

The needs of daily life went but a little way to model the great houses of that time. Architectural grouping, in order to impress the beholder, often led to dividing the mansion into separate blocks, one for the family rooms and State apartments, one for the kitchens and servants, and one for the stables. The kitchen, therefore, would be hundreds of feet off the dining-room, a drawback against which Evelyn warned his readers, "or else," says he, "besides other inconveniences, perhaps some of the dishes may straggle by the way." Sometimes the servants' quarters were located in two detached blocks hundreds of feet apart, balancing the composition, of which the family rooms formed the centre, and joined to the latter by open colonnades. How the service of the house could be carried on with the two halves of the staff separated from each other by a five or ten minutes' walk is not very clear; but of course the mansions were not built for the servants, but a little for the family itself, more for its grand guests, and most for the casual spectator who was to admire the lordly pile as he passed by.

The servants had to put up with what accommodation they could get. Their hall might be a vaulted underground room lighted only by areas, as at Buckland in Berkshire, and their bedroom windows might look out on to the back of the parapet. The butler might have to sleep in a room without any outside wall and no direct light and air. But in those days servants were merely servants, and could hardly expect to be exempt from suffering for architectural effect when their employers were content to suffer as well, though in less degree. And they must have suffered; for, wholly apart from considerations of bad service, the family were often located in a low basement with all the weight of the state apartments over their heads. Their rooms were not contrived to catch the morning sun or to get a splendid view, or, indeed, for any particular purpose relating especially to them; but they were arranged to fill up the space beneath the great rooms of state, and if they were comfortable, it was more by good luck than good management.

The architects of those days were, in fact, more or less of amateurs, and the kind of architecture in demand was such as amateurs could supply. Pre-eminent among them—at any rate in social position—was the Earl of Burlington; and when we consider this fact for a moment, can we be surprised at the amount of unreal and theatrical design that was produced? Who could expect an earl to concern himself with the niceties of household planning? No wonder that General Wade received that advice from Lord Chesterfield, to take a house over against his new mansion and look at it. Yet all through the century Lord Burlington was looked up to as the greatest patron of art that England had ever produced, and especially of architecture. Horace Walpole extols his taste and his ability, he "had every quality of a genius and artist, except envy"; yet, withal, he cannot disguise from himself that Ripley, who was an architect by occupation (or, as they were still called in those days, a surveyor) "in the mechanic part, and in the disposition of apartments and conveniences, was superior to the earl himself."

Pope, of whom Lord Burlington was a patron, satirises Ripley more than once, but then Ripley did not belong to Pope's faction. Pope himself, in one of his epistles, points out a way in architecture which no one seems to have followed, not even the nobleman to whom the epistle was addressed. Writing to Lord Burlington, he says:—

You show us Rome was glorious, not profuse,  
And pompous buildings once were things of use.

And again:—

Something there is more needful than Expense,  
And something previous ev'n to taste—'tis Sense:  
Good sense, which only is the gift of Heav'n,  
And tho' no science, fairly worth the seven.

Towards the end of the epistle he reverts to the same text:—

'Tis use alone that sanctifies Expense;  
And splendour borrows all her days from Sense.

It is rather amusing that a sermon founded on such an excellent text should contain so much that is at variance with it. Nor can we help smiling that the earl's work should be supposed to embody the principles here laid down, when we remember poor General Wade's house, or the villa at Chiswick, beautiful no doubt in grouping and proportion, but of which Lord Hervey said, "The house was too small to inhabit and too large to hang to one's watch." Walpole, who records this witticism, has some remarks on the house which are worth repeating. It is "a model of taste," he says, "though not without faults, some of which are occasioned by too strict adherence to rules and symmetry. Such are too many correspondent doors in spaces so contracted; chimneys between windows, and, which is worse, windows between chimneys; and vestibules, however beautiful, yet too little secured from the damps of this climate. . . . The ground apartment is rather a diminutive catacomb than a library in a northern latitude." Then he adds a few sentences which throw some light on one of the motives that actuated the eighteenth century. "The larger court, dignified by picturesque cedars, and the classic scenery of the small court that unites the old and the new house, are more worth seeing than many fragments of ancient grandeur, which our travellers visit under all the dangers attendant on long voyages." There you have it—"the classic scenery," and the "fragments of ancient grandeur," which were to be rivalled by English villas.

It is from the opinions of men who lived in the eighteenth century that we can best gather the motives that underlay their actions, and therefore a further quotation from Walpole may be excused:—"It was in this reign" (of George II.), he says, "that architecture resumed all her rights. Noble publications of Palladio, Jones, and the antique, recalled her to true principles and correct taste; she found men of genius to execute her rules and patrons to countenance their labours. She found more and what Rome could not boast, men of the first rank who contributed to embellish their country by buildings of their own design in the purest style of antique composition." We have seen one of these men of the first rank, Lord Burlington, and what he did. Another was Lord Pembroke, and he is worth singling out because, according to Walpole, "no man had a purer taste in building than Earl Henry, of which he gave a few specimens, besides his work at Wilton." Now his work at the house at Wilton is about as dull as anything can be, and far behind the "theatric bridge," as Walpole calls it, which he threw over his river. This bridge is less objectionable than the other "theatric" work of the time, inasmuch as it imposes no special inconvenience on any one, but whether a bridge of this kind is in harmony with English scenery is a debateable question.

Taste, of course, was the great requisite in that age. Lady Teazle endeavoured to acquire it along with other fashionable accomplishments, to her husband's great scorn—what had she, a country-bred girl, to do with elegant expenses and fashion before she married him? "For my part," replies the lady, "I should think you would like to have your wife thought a woman of taste." "Taste!" cries her husband, "zounds, madam, you had no taste when you married me."

The extravagancies of the second quarter of the eighteenth century sprang from an indulgence in taste apart from considerations of propriety, and it was the often mentioned Lord Burlington who led to them, partly by his own work and partly by his publication of the designs of Inigo Jones and Palladio's antiquities of Rome. But it only wants a comparison of Inigo Jones's work with that of Burlington and his successors, or a comparison of Wren's with theirs, to see how those two men were really architects, while the others were but amateurs dabbling in what they did not thoroughly understand, and into the details of which they scorned to enter.

But while we cannot but feel that in the true essentials of architecture they were sadly lacking, yet we must concede that they produced striking results. One of these fine palaces, when it was surrounded by its original gardens, must have been remarkably imposing. Take Blenheim, for instance. If we regard it as a home, we must be disappointed; but as the dwelling of a great noble, living in state and surrounded with all its attendant ceremony, receiving other great nobles with their retinues, and housing them in more magnificence than comfort, in these respects it has much to claim our commendation. There is much excuse for it in the fact that it was a gift from the nation to its greatest son; it had to be splendid at all costs—yet it did not meet universal appreciation even in those days, as witness the lines of Swift—

It's very fine,  
But where d'ye sleep or where d'ye dine?  
I find by all ye have been telling  
It is a house, and not a dwelling.

Great as the progress in architecture has been within the

last forty years, it has either been imitative or eclectic. We want it to be neither, for imitation architecture proclaims that we admit the superiority of our predecessors and eclecticism is but the pillaging of former architectures and rearranging the pieces; while what is wanted is either a new creation or a new and superior development, just as man is a superior development of the monkey, or even as the Apollo Belvedere or the Venus of Milo are superior developments of the average man and woman. I have insisted in these lectures on a much more complete and thorough knowledge of the art of construction than at present exists among us, because this is the foundation of our constructive art, and without a solid foundation no permanent monument will stand, but besides this an accurate knowledge of the strains on certain features gives the rough form they, or parts of them, must take. We saw in Byzantine that the abacus of columns had to be deeper and wider to support larger piers and greater weight; that the cap had sometimes to be cubic and only superficially carved to convey the weight to the shaft. The stone rings to connect the lengths of thin shafts together in Gothic have been turned into ornamental features. Structural knowledge, however, is far from being all that we want. We know we want this knowledge, and we also know that it may be acquired; but we at least equally want, if we do not more greatly want, creative genius, either to create something new and original, or to develop that which has gone before, as nature does, or has done, in all her works. This power, however, on the æsthetic side we know not how to attain; all we know is that it is the offspring of deep emotions, high aspirations and intrepid resolves in the nation, acting on a certain love and skill in the artists. The successful resistance to the Persian invasion caused all the fine arts in Athens to blossom, and if you will consider the circumstances of the Saracen, Gothic and Renaissance epochs you will see that the arts were forced into blossom by important national achievements, and that the artists of the period only wanted this stimulus to make them achieve their brilliant successes. As individuals, artists can only contribute in a small degree to such intellectual upheavals. Their business, however, is to be ready for them. We may hope that in a short time every student will have a thorough acquaintance with construction and materials, and will have learned the art of moulding to suit the climate. We also hope that each student will strive to develop the shaping of forms so as to captivate the most refined taste, so that when the flood comes that will again float the bark of architecture, so long stranded, they may be ready to man her and steer her to new discoveries and new conquests, so that the twentieth century may be one of the most flourishing architectural epochs the world has yet seen. In that epoch I feel sure that those who were Royal Academy students will not be the least conspicuous.

But when these grandiose ideas were applied to the houses of ordinary noblemen, much as they may have been cherished at the time, those noblemen's descendants find it hard to live in their palaces, and hard to maintain them.

There is not time enough on the present occasion to dwell much on the gardens that surrounded these great houses, but they were an acknowledged part of the general design, and now that they have in most cases disappeared, the vast houses lacking their support seem more wanting in common sense than they otherwise would. Among the illustrations in Campbell's "Vitruvius Britannicus," which may be considered as the epitome of the period under discussion, there are not a few showing the lay-outs round the great houses, which were founded partly on Dutch and partly on French examples. It was, however, probably Versailles that set the example to our English nobility, though nothing was done here on so vast a scale. The Duke of Montagu, who was Ambassador at the French Court for a number of years at the end of the seventeenth century, occupied the first few years of the eighteenth, after his return, in "erecting his seat at Boughton, in Northamptonshire, after the pattern, and as his dimensions would allow, after the very model of Versailles." It must be admitted that Boughton House is a very plain copy or rather reminiscence of Versailles; at the same time, its garden and wildernesses were of unusual magnificence and size, and adorned with numerous statues and a considerable extent of canals and ornamental water, enlivened by *jets d'eau* quite in the manner of Versailles as recorded in prints.

The house itself, although of a rather plain and sombre cast, is interesting as an almost unaltered example of an eighteenth-century mansion, simply though richly furnished. Its floors are polished, its walls panelled in large panels surrounded by a bold bolection moulding, the doors are lofty and set in thick walls, the chimneypieces are simple and massive and surround wide and deeply-recessed open fireplaces. The ceilings are (many of them) by that rather dull painter, Verrio; still, they impart a large amount of character to the place. Here and there is a panelled room or a fine chimneypiece of a hundred years before, showing that the house was not erected entirely new by the ducal ambassador. The walls are hung with ancient portraits and pictures, and the floors are full of ancient furniture. Through

the heavy sashes one looks out on to the undulating park, and the long and lofty rows of trees which form part of the celebrated avenues. There are attics innumerable scattered in every direction and approached by staircases where the handrail is mitred round the plain square newels, and twisted balusters join in to the swelling string. Through these attics you may go, and down a different staircase, to find yourself in a room that you thought was a furlong off on the other side of the house. Altogether an interesting place and one that gives a good idea of the haphazard arrangement of a large eighteenth-century house.

At any rate Boughton House was a home which could be inhabited all the year round—even the state rooms; which is more than can be said of many of its contemporaries. Nevertheless, with all their drawbacks these palaces were stately. The plans look gorgeous on paper and so do the sections showing the internal decoration. The effect of the places themselves is, perhaps, rather depressing on the ordinary person, the grandeur is a little too obvious—there is no such feeling of homeliness as in the many-panelled rooms of the early seventeenth century; but when all is said, the fact remains that the architects of the later time had a very definite aim in what they did, and they achieved it.

When we leave the mansions of the nobility, and come down to the houses of the squire or the well-to-do merchant, we find ourselves in a much pleasanter atmosphere. They have a quiet dignity about them which is decidedly restful and attractive, especially those of the first quarter of the century. In later times the portico idea became too prevalent, which consisted in affixing to the front of an otherwise plain house some variation of the columned front of an ancient temple. But the earlier houses, with wide corniced eaves, simple horizontal strings dividing the rows of sash windows, and combining with the quoins that emphasise the angles; these will no doubt long continue to form the model for houses of similar use and capacity. It is just a question whether this is quite the type that suits the present age; for our wants seem to grow always more complex, and to require a more elastic style than one depending for its effect on strict symmetry and unbroken horizontal lines.

If we cannot take a wholly sympathetic view of the purely architectural work of the eighteenth century—at any rate, in its more notable examples—neither can we forget that we are indebted to it for much that is suggestive in the work that embellished the architecture, especially in wood and iron. The ironwork of that period has never been equalled in England, and it lends an air of distinction not only to great houses like Drayton, in Northamptonshire, but to little suburban villas at Hampstead. The joiner's work of the time is full of suggestions. The sash window alone was enough to revolutionise architectural treatment, and the far-reaching effects of a mitred moulding are impossible to follow. Through all the changes of two centuries these two facts have remained with us—sash windows and mitred mouldings—and there seems no immediate prospect of their being superseded. The work of the plasterer was not so admirable as that of the joiner. He had become too expert, and was able to perform prodigies of modelling and high relief, which finally undid him, and he and his art perished together.

If we are to seek inspiration from the work of the eighteenth century, we shall find it in two directions. First, in the grand schemes of house and garden combined and in the general grandeur of treatment bestowed upon the great houses of the time. Not that we are to copy any blindly; but it is very desirable to realise how much the house and its surroundings depend upon each other; and equally desirable to learn how a grandeur of manner may be acquired. Secondly, in the sober and simple houses where the plainness of the general appearance is sometimes unexpectedly broken by the quaint treatment of a door or a chimney, and where the joiner's work is full of homely lessons.

It is often from the vernacular architecture of the country that we can get the most useful hints; whereas it is the palatial architecture that gives its stamp to the period and goes to furnish the text-books. The one is for show first and use second; the other is for use first and show second. The palatial architecture of the eighteenth century was surely given to us more as a warning than as an example; but it is worthy of attention, just as all phases of architecture are which have acquired any hold on public affection, and we are not likely, in view of our present methods of study, to fall into that attitude of mind towards any style which Evelyn exhibited towards Gothic. If we bear in mind that architecture must develop from within and not from without, we shall never again become the slaves of a foreign and a dead hand as our forefathers were in the eighteenth century, but we shall go forward, as we are indeed at the present time going forward, on different paths perhaps, and at different rates of speed—sometimes not without sharp divergence of opinion as to the propriety of particular steps—but always towards the same goal, the ennobling of our *Alma Mater*, the mother-art of the world.

Mr. J. M. Brydon said the author had adopted the same

satirical spirit in criticising as the writers of the eighteenth century had. Some of the epigrams in the paper were capital, but, like other satirists, Mr. Gotch in his remarks skimmed over work and did not trouble himself by examining details. In order to understand the buildings of this period, one should go back to those days. It was an age when everyone was craving for display, and the first thing men wanted was a palace, not a home. Thus the main portions of the house were built for display and elegance. The disposition of the plan was for magnificence. It was a revival of commercial enterprise, and was accountable for what is now called the middle class. These people wanted something to live in, so that we find those homely houses with comfort stamped on them outside and in. The eighteenth century gave us houses which in themselves were very often beautiful objects in composition, but more than that, they were models in proportion—one of the elements of architecture. Sir Joshua Reynolds praised Vanbrugh because he was a master of proportion and knew how to fit everything in. In the paper the architects of that period had been spoken of as amateurs. In those days no gentleman was considered to have finished his education unless he had some knowledge of art and especially architecture. He had great pleasure in proposing a vote of thanks.

Mr. E. W. Mountford, who seconded the vote, was supported by Mr. Lovegrove and Mr. H. W. Pratt.

Mr. Gotch returned thanks.

### THE CITY OF PALLADIO.

THIS little city of Vicenza, says a correspondent of the *Manchester Guardian*, may well detain the traveller for a short time. Though it cannot take rank, from the point of view of picturesque charm, with some other Italian provincial towns, it possesses many interesting buildings and pictures, as well as most beautiful surroundings; and as the birthplace of Andrea Palladio and the chief scene of his labours, it has a certain importance in the history of art. Here one observes how much better the Palladian style of architecture is adapted for the construction of buildings intended for public pomp and ceremonial and for private luxury than for that of churches. The two principal churches of Venice which Palladio designed, S. Giorgio Maggiore and the Redentore, though hardly perhaps meriting the execrations which Mr. Ruskin bestowed upon them, are certainly very poor and spiritless attempts to graft the principles of construction of a Greek temple or Roman basilica on a Christian church; but the colonnades, for example, here in Vicenza with which Palladio masked the late Gothic town hall or Palazzo del Consiglio can hardly fail to awaken admiration. And the Teatro Olimpico, still belonging to the Accademia Olimpica, for which it was built, and used for occasional representations, with its deep-sunk orchestra and semicircle of amphitheatrically disposed seats fronting a stage with an elaborate perspective, is certainly a very interesting production of a Greek or Roman theatre. Another striking building is the Rotonda, a villa on the lower slopes of Monte Berico, built with the most ingenious regularity, with four colonnades of Ionic pillars, topped with pediments, each opening into a large circular-domed hall painted in fresco and occupying the centre of the building. Had the Rotonda been provided with a loftier central cupola it might easily be mistaken at a little distance for a domed church with four equal arms, such as Bramante intended St. Peter's to be, and of which we have an example, though a bad one, in the Madonna del Monte on the hill above. The narrow ill-paved and arcaded streets of the city are often lined on both sides with palaces, many of them the work of Palladio. Side by side, however, with the stately unadorned Palladian edifices, with their pillars and porticoes, are beautiful Gothic palaces, showing clustered windows on the first floor and graceful, lion-guarded balconies, like those which rise above the windings of the Grand Canal; and also some fine work of the early Renaissance, especially in the portals, carved fancifully in delicate low-relief, with which some of the late Gothic palaces seem to have been afterwards provided. These earlier palaces still, in many cases, show traces of the frescoes with which their façades were originally covered—melancholy ruins and fragments of form and colour, no definite designs or entire figures being distinguishable, and the plaster in many cases having peeled off in great flakes and exposed the naked brickwork beneath. Nor must one omit to mention the red towers which distinguish Vicenza, like most of the cities of the Venetian *terra firma*, making such an agreeable contrast for the eye with the edifices of grey stone and stucco; in particular the marvellously slender tower which soars to such a majestic height from the side of the Palladian Basilica in the Piazza de' Signori, and near which, again, is the pillar bearing the Lion of St. Mark, which testifies to the long subjection of Vicenza to the great Republic of the Adriatic. Another picturesque feature of the city, an interesting memory of its varied history, is the tower of grey brick, battlemented

and machicolated, of the Scaligers (who preceded the Visconti of Milan as lords of Vicenza), and which rises immediately beside the gate, Porta del Castello, by which the city is entered from the railway station. But in the main Vicenza, as we see it now, bears the impress of the genius of its famous architect of the late Renaissance, the last great architect whom Italy produced, those who succeeded him—like Scamozzi and Longhena—having done little more than imitate him in a more or less feeble manner, and prepare the way for that wretched abnegation of all genuine style which is known as Baroque architecture. Many of these Vicentine palaces have fallen miserably from their once high estate—boarded windows, courts grass-grown and occupied by stables, basements turned into banks, offices, printing establishments, and the like, all testifying to the decay or extinction of many of the ancient noblesse.

Vicenza, like every provincial North Italian town of any importance has of course its Museo and Pinacoteca, where its local school of painting may be studied. It is not a collection of first-rate interest, even for a provincial gallery, but it contains some good pictures, and is, moreover, housed in one of Palladio's finest palazzi. Vicenza produced two painters of some importance: Bartolomeo Montagna and Giovanni Buonconsiglio, who often appends to his signature the word "Marescalco," or smith, to signify his profession, or perhaps that of his father—a word still current in Vicenza. They are barely mentioned by Vasari, in that curious jumble of information, correct and incorrect, which he calls the "Life of Vittore Scarpaccia," but it seems highly probable (it is stated as a fact by Lanzi) that Montagna was a pupil of the greater Mantegna of Padua; while a certain stiffness and angularity in figures and draperies seems to indicate a possible indebtedness to Dürer, whose presence in Venice during the last decade of the fifteenth century was certainly not without effect on Venetian art. It may be, however, that certain features in Montagna which recall Dürer and the Germans are due to the intermediate influence of Mantegna. The best work of Montagna is, however, not to be found in the Pinacoteca; Vicenza itself probably possesses nothing finer from his hand than the profoundly impressive *Pietà* in the church of the Madonna del Monte Berico, just beyond the gates of the city, which bears his signature and the date 1500. It is a work hardly unworthy of the great Paduan who was probably his master; nor is the expression of grief in the faces of the women and St. John, though sufficiently violent, at all more excessive than is to be seen, for example, in Bellini's *Pietà* in the Ducal Palace at Venice, or in Mantegna's striking but curiously ugly *Death of the Virgin*—with a kind of beauty in ugliness—at the Prado in Madrid. Buonconsiglio—a rare master, of whom there are two fine examples in Venice, *S. Sebastiana with SS. Lorenzo and Rocco* in S. Giacomo dall' Orio and a group of saints, a fragment of a large altar-piece, in the Academy—is also represented here by a fine *Pietà*, decidedly the most striking picture in the room or the Pinacoteca which is devoted to the Vicentine masters, and with an arabesque of sea-horses, putti and foliage in grisaille on a green ground painted below it as a kind of predella, which Lanzi refers to as perhaps indicating his indebtedness likewise to the Paduan School. The best picture, however, by Buonconsiglio in Vicenza is the *Madonna Enthroned with Four Saints*, in S. Rocco, a noble painting not unworthy of the eulogies of Lanzi, and which, though not mentioned in Baedeker, is probably the finest work existing in Vicenza by any Vicentine master. Apart from the painters of the local school, the most interesting pictures which the city possesses are, probably, the *Madonna Enthroned with Two Saints*, by the ever delightful Cima, in the Pinacoteca; a powerful and admirable *Madonna with Saints*, by Palma Vecchio, in S. Stefano; a reported Giorgione—*Christ Bearing His Cross*—in the Palazzo Loschi; and Bellini's *Baptism of Christ*, in S. Corona. These pictures would alone suffice to give to Vicenza a certain artistic importance. The Cima in the Pinacoteca, penetrated, like all his work, by a profound religious feeling, is interesting as being his first dated picture, also as being painted in tempera (sadly damaged, alas! in places), he having soon resigned that medium for oil, under the influence of Antonello da Messina. The John Bellini in S. Corona is a fine late work, and when compared with early Madonnas by his hand of the Byzantine type, shows what an immense advance in his art he made during his long life, and how he may be said to form a link of connection between the Venetian primitives and the thoroughly matured art of Giorgione and Palma. Still, though he doubtless deserves all the praise which Ruskin bestows upon him, it must be said that, beautiful as is his later work alike in drawing, composition, tone and sentiment, his faces are almost invariably somewhat deficient in expression and character. It is possible, I think, to receive a greater amount of satisfaction and pleasure both from Cima and Carpaccio than from the more perfect work of the master who, alike in contemporary and permanent renown, far surpassed them.

Better, however, than the palaces of Palladio, better than Montagna and the other Vicentine masters, as seen in the

churches and the Pinacoteca, are the beautiful environs of the city. It is good to be almost anywhere in the country when the first fresh loveliness of spring descends upon the world, but best of all to be able to ramble in such a gracious region of hill and wood as the Monte Berico, which is famous, by the way, in the annals of Italian patriotism for the desperate but unsuccessful resistance of the brave Vicentines to the Austrian yoke on June 10, 1848. Just above the ugly white pilgrimage church of the Madonna del Monte (in the refectory of whose convent, now a house of the Servites, is a *Banquet of Gregory the Great*, by Veronese, pulled to pieces by the Austrians, but afterwards restored) there is a modest osteria, once doubtless attached to the monastery, and very possibly an albergo for pilgrims. There, sitting beneath a vine-trellis, which in summer must afford a grateful shade against the ardours of the sun, one enjoys a prospect of the little city beneath, of the green country around and beyond, and of a vast semicircle of snowy Alps, the Alps of Recoaro and Bassano, which is more than a compensation for the plainness of the fare and the acidity of the country wine. The road, which thence goes serpentine along the top of the hills, with a wide prospect on either hand—the isolated volcanic hills of Arquà, with their softly rounded summits, being seen to the left, as they rise in vaporous blue from the purple plain—must be delightful at all seasons, but never more so than now. Only the day before, at Padua, the weather had been wintry, with a cold rain falling and little signs of spring; but here were flowers, flowers everywhere, almost the first I had seen this year—violets, both the deep-hued fragrant one, Milton's "glowing violet," and the almost scentless white; the bright yellow stars and burnished leaves of the little celandine, purple and white fumitories, blue periwinkles, little fields of white wood-anemones and daisies everywhere. And down among the mazes of a little copse below the road, and afterwards in abundance in many places, I found a little violet flower peeping up from among the brown leaves of autumn, and recognised it with a thrill of pleasure. It was the beautiful hepatica, the harbinger of spring in Switzerland, where in March its delicate six or eight petalled cups, thrusting their heads above the brown forest-carpet of withered leaves before its own leaves have yet unfolded, are the first flowers which break the winter torpor of the woods. And beside it was another Swiss flower, a large hellebore, with green drooping flowers and many-fingered leaves. Nearly all the townspeople, out for their Sunday walk, laughing and happy, had flowers in their hands or bosoms or buttonholes—bunches of purple violets and sprigs of whitethorn from the hedges and handfuls of daisies. There are many pretty villas along the road and on the slopes of the hills, which are apparently well cultivated and yield much wine; and here, amid the undulations of his native hills, Antonio Fogazzaro, one of Italy's chief living novelists and men of letters, the author of "Daniele Cortis," has his summer home. Among the charms of this pretty hill district are the many field and wood paths, affording a facility for rambling from the main track which is not too common in Italy, as well as the wide, unimpeded prospect commanded by the carriage road, which keeps near the summit of the hills. Another day, descending the southern slopes of Monte Berico, I found in an open piece of sun-bathed meadow a large scarlet anemone. It was but a solitary flower, yet the whole of spring and summer seemed to be already present, in the germ as it were, in the splendid scarlet fire of its beautiful cup. And the singing of birds to their mates, the humming of bees, the flash of an occasional butterfly, and the scampering of the black lizards up and down the limestone hedges—as well as the genial warmth of the bright afternoon—all testified, in spite of the leafless oak copses around, to the advent of a spring that would soon pass, by leaps and bounds, into the fiery glow of an Italian summer.

### THE EMPEROR WILLIAM MEMORIAL, BERLIN.

THE great monument of the Emperor William I. has been unveiled in Berlin by his grandson. The *Times* correspondent gives the following account of the work:—

As early as March 1888, within a fortnight of the first Emperor's death, the Imperial Diet had unanimously resolved that a monument should be erected to the founder of the German Empire. A special commission was appointed and a free competition in designs for architects and sculptors was instituted. Models of the various schemes were exhibited, but although several of them were rewarded with high premiums none was found to conform to the ideas which the reigning Emperor and his advisers entertained regarding the form which so important a national tribute and emblem at once of loyalty and patriotism should assume. His Majesty himself took an opportunity of giving very distinct expression of his approval to the Schlossfreiheit as the most appropriate site for the monument, and he, at the same time, passed a sweeping condemnation upon all the ambitious architectural schemes which had been proposed, some of which, indeed, involved projects like the bodily removal

or elevation of the whole Brandenburg Gate and the rebuilding of the great square into which it leads, the Pariser Platz. The Imperial Diet finally decided to leave the whole question to the decision of His Majesty, who, as had been anticipated, selected the Schlossfreiheit as the site of the monument and the sculptor Reinhold Begas as its architect and author. Meanwhile, a spirit of economy as well as of general opposition had begun to inspire the Diet, and when the subject of ways and means was brought before it the Deputies, instead of voting 8,000,000 marks for the structure, as had been demanded by the Government, only consented to grant 4,000,000 marks. "Not joyfully," as Herr von Boetticher announced, did the Government accept the reduced estimate of the Imperial Diet, but Professor Begas undertook to execute his task within the limits assigned him.

Opposite the monumental west portal of the castle, named after its architect the Cosander Gate, and separated from it by the roadway of the Schlossfreiheit, Professor Begas has erected a semicircular double colonnade, the diameter of which is about 87½ yards and its radius about 44 yards. The whole edifice is set on a raised platform of white sandstone and is strongly buttressed by a wall of heavy masonry on the side next the water on which, indeed, it abuts. Either extremity of the semicircular colonnade is surmounted by triumphal cars like those on the Arc de Triomphe in Paris. The cars and the four steeds by which they are drawn are cast in bronze, and in each is borne an allegorical figure holding an unfurled standard and representing respectively North and South Germany. The semicircle of the colonnade is adorned by numerous other symbolical groups and figures, some of them representing the kingdoms of the German Empire—Prussia, Wurtemberg, Saxony and Bavaria—others art, science, agriculture and industry, and navigation. These subordinate details of the structure are the work of Begas's pupils and of other sculptors.

The bronze statue, colossal as are its proportions, does not fail to convey the features and form of the late Emperor as he may have appeared in what was his prime—though for most other men it would have been old age—the period when he was between seventy and eighty. He wears the uniform of a Prussian General, with a pickelhaube or spiked helmet and his martial cloak. The steed he rides has been magnificently modelled by Begas and is led by a genius in the form of a beautiful maiden bearing in her hand a branch of palm. The entire conception is highly symbolical. The Emperor's countenance bears the impress of calm tranquillity, and his character is conceived as being transferred from the earthly form of the mortal hero into the countenance of his immortal genius.

The pedestal is of bronze, resting on a cruciform block of granite, on each arm of which is a couchant lion in bronze. At the front and back of the pedestal are bronze shields bearing respectively the inscriptions, "William the Great, German Emperor, King of Prussia 1861-1888," and "In gratitude and true affection—the German people." At each corner stands a winged figure of Victory. On the sides are two allegorical scenes in relief representing War and Peace. In the former the Fury of War, borne on a snorting charger amid storm and lightning and bearing aloft in her hands flaming torches, is seen trampling down in her wild career a field of waving corn. In attendance on her are two demons, armed with sword and scourge. Peace is represented by a maiden with flowing hair descending from the mountains to the valley. By her side walk two children, the one bearing a palm branch, the other with a basket of flowers above his head, with which Peace is strewing the way. In the foreground kneel a peasant with his wife, their hands stretched out in supplication to the approaching maiden, while on the other side a mother and her boy are planting a young oak. In the background a shepherd is reposing amid his flock and a herdsman follows with rapt gaze the retreating figure of Peace.

The total height of the monument is 65½ feet, the equestrian statue of the Emperor measuring 29½ feet. In itself the statue is a monumental and most effective work of art, but its size seems to dwarf the colonnade behind it.

### SUSSEX ARCHÆOLOGICAL SOCIETY.

THE annual report of the Sussex Archæological Society refers at first to the success of the Jubilee celebrations, comprising a dinner at Brighton, a perambulation of Lewes, a conversation by the mayor and mayoress, an exhibition of antiquities, a visit to Arundel Castle and to Parham. Grateful appreciation is expressed concerning the hospitality of the Duke of Norfolk, Lord Zouche, for his reception at Parham, and to the mayor and mayoress of Lewes, Mr. Councillor and Mrs. G. J. Wightman. The committee regret that a fire at the bookbinders in London, necessitating the reprinting of some of the sheets, has delayed the publication of volume xi. of the collections, but they will do their best to hasten the issue. The committee express their regret at the resignation of their honorary secretary and editor, Mr. Henry Griffith, F.S.A.,

and place on record their appreciation of the services he has rendered to the Society. In his place they have appointed Mr. H. Michell-Whitley, F.G.S., as honorary editor. Consideration has been given to the desirability of promoting and fostering a photographic survey of the county, upon lines recommended by the Congress of Archaeological Societies, in union with the Society of Antiquaries of London. The matter is being dealt with by a sub-committee, and if sufficient interest is taken in the subject by the local photographic societies it is hoped some useful work in this direction might be undertaken. During the past year several valuable gifts have been made to the museum and library, including, amongst others, an early sepulchral urn, of large size, found at Eastbourne, presented by the Duke of Devonshire (a vice-president of the Society); some specimens of carved stone, discovered during the rebuilding of a portion of East Mascalls, Lindfield, presented by Mr. W. Sturdy; three curious pilgrims' bottles, found in a house in the Cliffe, Lewes, and presented by Mr. J. Huggett; a bronze celt and piece of bronze, apparently a portion of a founder's hoard, dug up at Aldrington, and presented by Mrs. Hammond; two rare engravings, representing a naval engagement off Beachy Head in 1690, presented by Mr. John Haines; and the history of the Hundred of Blackheath, Kent, an illustrated folio, presented by Dr. Henry H. Drake. The books in the Society's library have been rearranged, and a new manuscript catalogue has been completed. The tapestry in the Barbican has been rehung. The committee hope to be able to arrange during the coming year for holding, in different places in Sussex, sessional meetings for the reading of papers and the exhibition of antiquities. The present number of members is as follows:—Ordinary, 465; life, 81; honorary, 8; total, 553; showing a clear gain upon the year (after deducting all losses by death, withdrawal, &c.) of 20 ordinary members and one life member.

The receipts for the year, including 247*l.* from subscriptions and 121*l.* for admissions to the Castle, amount to 398*l.* 3*s.* 3*d.*, and a balance in hand of 220*l.* made the total revenue 618*l.* 10*s.* 9*d.* The expenses, including 75*l.* for printing volume xi. of the Society's Collections, were 422*l.* 6*s.* 3*d.*, and a balance remained in hand of 196*l.* 4*s.* 6*d.*, in addition to 566*l.* in Consols.

Mr. Michell-Whitley has been appointed as hon. secretary, and Mr. J. H. A. Jenner as hon. curator, with Mr. C. T. Phillips as hon. local secretary for Brighton and Hove. Rotherfield was chosen as the place for the annual excursion.

#### LORD LEIGHTON'S SKETCHES.

IT has seemed to some of Lord Leighton's friends that an attempt should be made to keep together for the benefit of the public a representative collection of his drawings. In no more appropriate manner can the gifts and industry of a great artist be commemorated than by securing for his country a collection of his works. It is an uncontested fact that the drawings are among the most beautiful works which Lord Leighton has left. A careful selection of these has been made, which date from his boyhood to the last months of his life. It is hoped that before long they will be placed on the walls of the house which has been offered to the nation by his sisters under certain conditions. The price to be paid for this collection, which numbers several hundreds, is 1,150*l.* Between four and five hundred pounds of this sum have been already subscribed. Any who wish to help in acquiring this collection for the public are cordially invited to send to the honorary treasurer, Mr. Henry Percy Horne, 4 Lincoln's Inn Fields, for a printed catalogue giving the price and particulars of the sketches, or to send directions to 1 Great College Street, Westminster. His Royal Highness the Prince of Wales has expressed his sympathy and his approval of the scheme.

#### BIRMINGHAM ART GALLERY.

THE Society for the Preservation of Pictorial Records of Ancient Works of Art, which has from time to time presented a number of most interesting water-colour drawings to the Corporation Art Gallery, has just forwarded, through the hon. secretary, Mr. S. C. Cockerell, two more drawings, which are now hung in the Long Gallery. The drawings are by T. M. Rooke, of the Royal Water-Colour Society, and are faithful and beautiful renderings of the two subjects selected. The larger one of the two is a fine drawing of the west doorway of the collegiate church of St. Ours, at Loches, in Touraine. This little town is one of the most picturesque places to be found in the Loire district, and the church of St. Ours is a very interesting monument of Gothic architecture, standing quite alone in its singularity. It was begun by Geoffrey, Count of Anjou, in 962. To the west of the belfry tower is a low, square, vaulted porch, or narthex, of early Romanesque work, added in the twelfth century, out of which opens the very large and perfect Romanesque doorway, which Mr. Rooke has so faithfully reproduced. It is rich in mouldings and sculptural figures, and the general design is intended to represent the Divine

Power seated, enthroned, and adored above the arch of a strange world, the portal of the Holy Place. The second and smaller drawing is a copy of one of the stained-glass windows from the cathedral of Notre Dame, Chartres. This church, one of the most magnificent in Europe, has for one of its most striking features a perfect treasure of painted glass, not to be equalled in France. More than 160 windows are completely filled with it. Those of the nave and choir illustrate subjects from the Bible and legends of the saints; in their lower compartments are shown representations of the various trades of the city, the shoemakers, basket-makers, and so on, showing that various guilds and corporations were the donors. The one selected by Mr. Rooke was presented by Thibaut of Châteaudun and the vine-dressers of the district. A compartment of the window is devoted to each of them. The other subjects in the window are Joachim and Anna, the Announcement to Joachim, the Announcement to Anna, Little Mary in her Bath, a Dream, the Meeting at the Golden Gate, and the Refusal of their Sacrifice. A portrait of great local interest has also been presented to the city by Miss Ellen G. Hill. It is the portrait of her grandfather, Thomas Wright Hill, the well-known founder of Hazelwood School, in the Hagley Road. This was the most notable educational establishment in the neighbourhood of Birmingham at the beginning of the present century. Mr. Hill began life as a brassfounder in the town, but found it uncongenial; and, having developed an aptitude for teaching in the New Meeting Sunday School, he opened a school of his own at Hill Top about 1803. He was the father of Sir Rowland Hill; Matthew Davenport Hill, recorder of Birmingham; Edwin Hill, who was at the Stamp Office; Frederick Hill, inspector of prisons in Scotland; and Arthur Hill, who was headmaster of Bruce College School. Rowland Hill assisted his father with the school, which was removed to Hazelwood about 1819. A most interesting account of it is given in the "The Making of Birmingham," by Mr. R. K. Dent. Thomas Wright Hill died in 1851. This portrait of him was painted by Mrs. Charles Pearson, whose maiden name was Dutem. She was born in 1799 and died in 1871. Early in life she married a solicitor named Pearson, who was afterwards a member of Parliament. She exhibited portraits at the Royal Academy from 1821 to 1842, two of them being portraits of Lord Mayors.

#### GENERAL.

**The Competition** for the new fire-brigade station, Aberdeen, has been decided in favour of Mr. A. H. L. Mackinnon, architect, Union Street, Aberdeen—estimated cost of design, 10,400*l.*; 2nd, Mr. A. Ogg Allan (11,000*l.*); 3rd, Mr. John Rust, city architect (11,400*l.*); 4th, Messrs. J. & J. A. Souttar (12,000*l.*). All are resident in Aberdeen.

**Messrs. Clayton & Black**, of Brighton, are the architects for the new workhouse to be erected at Kingston for the Steyning Union, which will cost from 35,000*l.* to 40,000*l.*

**Messrs. W. D. & H. O. Wills** have offered to subscribe 25,365*l.*, or about a quarter of the amount required, towards the erection of a sanatorium in Bristol.

**The Government** consider that 75,000*l.* will suffice for the expenses of the British section in the Paris International Exhibition. For the expenses of the German section 5,000,000 marks, or 250,000*l.*, will be allowed.

**An Art Gallery** is to be erected in Bath as a memorial of the Queen's reign. The money will be provided by a bequest of upwards of 8,000*l.*, supplemented by subscriptions.

**The Leighton Memorial Committee** have decided to entrust the execution of the work to Mr. Brock, R.A. There will be a recumbent figure in bronze of the late President of the Royal Academy in his peer's robes. When finished it will be placed in St. Paul's Cathedral.

**A Syndicate** has been formed to erect a new theatre at Tunbridge Wells. Mr. John P. Briggs, of Effingham House, Arundel Street, has received the appointment as architect.

**The Receiving Day** for pictures intended for the forthcoming exhibition of the New English Art Club at the Dudley Gallery is fixed for Monday, March 29th, and the jury has been elected as follows:—Mr. P. W. Steer, Mr. F. Bate, Professor Brown, Mr. H. Tonks, Mr. G. Thomson, Mr. M. P. Lindner, Mr. G. L. Henry, Mr. B. Sichert, Mr. A. S. Hartrick and Mr. A. Tomson. It will be necessary for non-members of the club to procure the written invitation of two members to submit not more than two works to the jury.

**The Members** of the Edinburgh Architectural Association will to-morrow visit Hatton House. This is a large mansion, comprising a keep of the L plan, closely surrounded by a seventeenth-century mansion house, ornamented with several round towers. The building is in fine preservation and stands in the centre of an old garden, ornamented with arbours, terraces, statues and walls. Hatton belonged to the Lauder family and passed by marriage in the seventeenth century to the Maitland family—the Earls of Lauderdale.

# The Architect.

## THE WEEK.

A CASE which was heard lately in the Ripon County Court is instructive. Mr. MALLINSON, architect, sued Mr. TREES, a contractor, to recover 30*l.* 5*s.* for quantities prepared of almshouses at Ripon. There was a competition in 1890, when the plaintiff was successful. He drew the plans and got out quantities, which were approved in April 1891. The defendant was accepted as contractor. The plaintiff was, however, informed that the trustees of the almshouses did not propose to use his plans. His solicitor afterwards applied to the contractor for the payment of 30*l.* 5*s.*, and threatening legal proceedings. In reply it was stated that, as the plaintiff had ceased to be architect, he could have no claim on the contractor. At the trial Mr. MALLINSON gave evidence, and said that his quantities and specifications were new. As Judge TURNER accepted the statement, he held that the plaintiff was entitled to payment, and gave judgment for the amount claimed with costs. The case is interesting, especially as it does not appear that the plaintiff's plans were used.

In their last report the Council of the Surrey Archæological Society express regret that the deficit on the yearly account shows a slight increase; this is partly to be accounted for by the increased rent which has fallen upon the Society since the loss of the part tenancy of the London and Middlesex Archæological Society. Up to the present the Society has been unable to secure another tenant. In order to lessen this deficit and to keep the annual expenditure within the annual income, it will be necessary, unless a large addition can be made to the number of annual subscribers, to cut down the size of the "Collections," and reduce the number of illustrations. To a certain extent this has already been done. To further reduce the expenditure on this item will only tend to impair the efficiency of the Society's work. The losses by death and resignation have been unusually heavy during the past year, and the number of new members elected has only been small. The number of members now stands at 297, viz.:—Annual, 202; life, 93; honorary, 2. During the year 7 new members were elected, viz.:—5 annual and 2 life. By death the Society has lost 8 members, viz.:—3 life and 5 annual. By resignation, 10 members. Total, 18; loss over gain, 11. The Council for some time past have had under consideration the advisability of raising the life composition, as at the present rate of interest the composition is found to be unremunerative. At the annual meeting it was accordingly decided that henceforth the amount to be paid will be 7*l.* 10*s.*, with the usual entrance fee, an increase of 50 per cent. Mr. MILL STEPHENSON, one of the honorary secretaries, has resigned his office. Viscount MIDDLETON, the president, said he considered, on account of the state of the finances, that the headquarters of the Society should be removed to Guildford, and by having a home in Surrey more subscriptions were likely to be attracted.

A CASE was lately heard before Mr. Justice WALKER at Victoria, British Columbia, in which the plaintiff, a contractor, claimed damages from the trustees of a church for delay in furnishing him with plans and specifications, in addition to extras, amounting in all to 7,869 *dols.* The judge's remarks would be worthy of the English High Court. He said:—"Building contracts, like all other contracts, have, according to a well-known rule, to be construed by the Court; and as plans and specifications, when referred to in the contract, form a part of it, they are, of course, included in this rule. Hence the question of what are and are not extras in the present case depends on the contract and the specifications, and is a question for me to determine; and even had I left it to the jury, their opinion, however sound, would have been inoperative. My object was to get their valuation of the work charged for, so that if the plaintiff should be entitled, according to the construction of the contract, to the benefit of any item

so valued, I would be enabled to give it to him. Before dealing with each of these items, as I propose to do in their order, it may be useful to quote the first paragraph of the contract, which speaks for itself, viz.:—"The specifications and drawings are intended to co-operate, so that any works exhibited in the drawings and not mentioned in specifications, or *vice versa*, are to be executed the same as if mentioned in the specifications and set forth in the drawings." Although the jury recommended that several items should be treated as extras, the judge declined to allow any which were specified or appeared on the drawings. The plaintiff therefore obtained only 130 *dols.*, while the defendants on a counterclaim were awarded 300 *dols.*

AMONG the models in the South Kensington Museum is one of a portion of the "stanze" of the Appartamento Borgia in the Vatican. In 1885 the museum authorities obtained permission to have it made, and in 1888 it was completed and forwarded to South Kensington. The delicate relief decoration of the groins and bands was executed in the model by Signor ADOLFO CONSOLANI, and the copies of the frescoes were painted by Count LEMMO ROSSI SCOTTI, of Perugia. The frescoes represented in the model are *St. Catherine before the Emperor Maximin*, the *Escape of St. Barbara*, and the *Visit of St. Paul the Hermit to St. Anthony*, by PINTURRICCHIO. The subjects of the paintings on the ceiling are scenes in the story of OSIRIS. It is believed that the construction of this model aroused great interest in this suite of rooms at Rome, with the fortunate result that His Holiness Pope LEO XIII. ordered the books belonging to the Vatican library, until recently kept on shelves placed against the walls of the Appartamento, to be removed, and arrangements were made so that the public might have access, a privilege until now exceedingly difficult to obtain.

THE TAYLOR art scholarship and prizes were awarded in Dublin on Tuesday. The judges were Viscount POWERSCOURT, appointed by the Royal Dublin Society; Mr. NATHANIEL HONE, R.H.A., appointed by the Royal Hibernian Academy; Mr. WALTER ARMSTRONG, Director of the National Gallery, appointed by the trustees of the will of Captain TAYLOR. The following awards were made:—Class I.—Scholarship 50*l.*, Miss ALICE M. LATIMER; prize 15*l.*, Mr. WILLIAM N. M. ORPEN; prize 5*l.*, Miss FRIDESWIDE S. PERROTT; extra prize 5*l.*, Mr. DAVID GOULD. Class II.—Prize 10*l.*, Miss E. M. RICHARDSON. Class III.—Prize 10*l.*, Miss FRIDESWIDE S. PERROTT. Mr. GOULD is a student in the Belfast School of Art. The other prize winners studied in the Metropolitan School of Art, Dublin, of which Mr. BRENNAN is head master.

MR. ALDERMAN KENRICK, M.P., has presented four panels to the Birmingham Town Hall which were designed and executed by students of the School of Art. They are as follows:—"Instrumental Music," by Mr. SIDNEY H. METEYARD; "Vocal Music," by Mr. HENRY A. PAYNE; "Lench's Trust Almshouses," by Miss KATE E. BUNCE; "Dr. Sacheverel," by Mr. BERNARD SLEIGH. The estate committee have expressed to Mr. Alderman KENRICK their hearty thanks for his generous gift. The return of the number of days and the purposes for which the use of the town hall was granted or let during the year 1896, shows 151 gratuitous lettings, as compared with 179 in the previous year, and 22 lettings on payments, as compared with 27. The number of free organ recitals given during the year was 34.

A CONVENTION of brickmakers has been held at Buffalo at which the subject of efflorescence was considered. The conclusion arrived at was that the solution of the difficulty lies in slow firing and drying, and in maintaining as large a flow of air as possible through the kiln until the water smoke shall have evaporated the moisture.

## PLASTERING.\*

THERE are books which resemble one class of men, for they appear to be destined to ill-luck. We hope Mr. MILLAR's volume on plastering is not to be numbered among them, but there seems to be a fatality about it. He is a working plasterer who was ambitious to write a comprehensive book about his craft. He prepared himself by study, travel, experiment and discussion with fellow workmen. He made some progress with the composition, but "troubles came upon him—illness, misfortune, domestic afflictions and last of all a fire, which not only bereft him of house and home, but burnt all his treasured manuscripts and drawings and all he had written for his book." Mr. MILLAR was no more daunted than his countryman, THOMAS CARLYLE, when the "French Revolution" was consumed. He set to work anew and prepared the manuscript and drawings, but the failure of the publisher to whom he confided them disappointed his expectation. The result of a third attempt is now before us in the shape of a volume measuring 11 inches by 10 inches by 2 inches and weighing half a stone. Fortunately for him, Mr. BATSFORD came to his rescue, and to the publisher's enterprise we are indebted for a miscellany which is so vast it might be called an encyclopædia of plastering. It is easy to understand why any one who has had experience of books, like Mr. BATSFORD, should endeavour to enrich technical literature with a work which is unique. The "practical treatise" has all the qualities which such a title should suggest. In its pages the subject is treated as if plastering were the most important of the decorative arts which attend on architecture. A page or two will be enough to suggest that the author is not only a master of his craft, but is possessed by pride in its importance, and such a combination is not to be met with every day by those who have to trade in the literature of technical subjects. It is no wonder an experienced publisher should be eager to launch the volume at the present time. We would advise those who may wish to have the book not to judge of its character by the frontispiece. That is a reproduction of the certificate of membership of what is called "The National Association of Operative Plasterers." Nearly all plates of the kind are hideous, but the Plasterers can claim to possess the worst of all. It is supposed to be an architectural composition, and it suggests how little is known by men who have to assist in the completion and adornment of buildings about the simplest architectural forms. As Mr. MILLAR professes his admiration for the design, he compels his readers to believe he is also deficient in knowledge, and that what he says about form should be skipped. The illustrations of his own work, however, suggest the possession of more than the average designing power, and his selection of subjects is generally creditable to his taste. Mr. MILLAR, we are afraid, accepts the certificate as one of the outward signs of trades unionism, and is willing, in common with a host of men, to sacrifice his judgment to comradeship. But we doubt whether the National Association of Operative Plasterers will in return be munificent enough to purchase one copy of his volume.

The art of the plasterer is one of the oldest, for the early builders could hardly fail to observe what an excellent medium for concealing defects was offered by plaster. It also lent itself to simple as well as elaborate adornment of a building. Mr. MILLAR has ascertained that the Egyptians were as familiar with "three-coat work" as any operative in London. The plaster was made from gypsum, and when used on partitions the stucco was "laid on reeds, laced together with cords for lathing, about  $\frac{3}{4}$  of an inch thick, barred and finished just as we do now." The Greeks used plaster not only in buildings but in paintings. A nephew of PHIDIAS made a ground of stucco mixed with milk and saffron and polished with spittle rubbed on by the ball of the thumb. Mr. ROBINSON says he found at

Agrigentum plaster from one of the temples existing in a perfect state, and not thicker than an egg-shell. The illustrations of plaster-work from Rome and Pompeii reveal the exquisite forms which were produced in the first century. They seem to be enlargements of antique gems. But we cannot follow the history of the art. During the Renaissance stucco was in universal use, and in England it would be hard to say when the people were entirely ignorant of its utility. Experience suggested the edict of King JOHN in 1212, which commanded that "all houses which till now are covered with reed or rush, let them be plastered within eight days, and let those which shall not be plastered within that time be demolished by the aldermen and lawful men of the venue." The Plasterers' Company dates from 1501. In England and Scotland we have countless proofs of native and foreign skill. A very large number of examples will be found illustrated in Mr. MILLAR's book.

In treating of history Mr. MILLAR has to depend on intrinsic evidence. But in dealing with materials and operations he is able to utilise his own varied experience. He appears to be impartial throughout, and his abstracts and descriptions will be useful to practical men. The subject may appear to be dry, but plastering, like other things, has its curiosities, and the selection of materials is one example. Thus in one paragraph we read:—

The admixture of various materials with lime and with plaster to form stucco is referred to by many ancient writers. Pliny mentions fig-juice as being mixed with stucco. The Egyptians mixed mud from the Nile with plaster for some of their work. Elm-bark and hot barley-water was mixed with the stucco for Justinian's Church of the Baptist, Constantinople. We find bullock's blood employed for this purpose as well in mortar for Rochester Cathedral in the latter part of the ninth century. Bishop Gundulph (1077-1108) is stated to have mixed blood with lime to make it hard. Hot wax mixed with lime was used at Rockingham Castle in 1280. White of eggs and strong wort of malt were mixed with the lime used for Queen Eleanor's Cross at Charing Cross in 1300. Pitch and wax were mixed with the lime used for Edward II.'s works at Westminster in 1324. Mediæval builders habitually used beer, eggs, milk, sugar, gluten, &c., for mixing with mortar for cathedrals. Frequent entries found in the archives prove this. One reads, "For beer to mix with the mortar." Bess of Hardwick's masons used beer in their mortar, having to melt it in the cold winter of her death. Old plaster is found to have rye straw mixed with it for binding, and was very strong. A brown substance, somewhat like plaster but full of fibre, was in use in the sixteenth century. The accounts for the repair of the steeple of Newark Church in 1571 contain an entry, "6 strike of malt to make mortar to blend with ye lyme and temper the same, and 350 eggs to mix with it." During the building of the Duke of Devonshire's house at Chiswick, the exterior of which was plastered with stucco, the surrounding district was impoverished for eggs and butter-milk to mix with the stucco. Peter le Neve's mention of rye dough stands not alone, as Sir Christopher Wren's "Parentalia" (1750) records the use of "marble meal" as the old and still the modern way of stucco-work in Italy. "Marble meal" simply meant marble dust ground as fine as meal. This dust was used for fine work. Sugar and the gluten of rice are used in Ceylon and India. The Chinese use a rich unctuous earth in combination with lime. In some parts of France urine was used with plaster in the sixteenth century. Nearly all these admixtures are to retard the setting, to allow more time for the manipulation of the stuccoes. Some are to accelerate the setting, and some are to increase their ultimate hardness.

As the book has been written by a workman, it is needless to say that curious facts derived from the by-ways of history of plastering form a very small portion of the pages. The greater part treats about the execution of work, and deals with such subjects as materials, lime plastering, decorative ceilings, running diminished and circular mouldings, exterior plastering, modelling, moulding and casting, model and running mould making, gelatine moulding, fibrous plaster-work, reverse moulding, compositions, scagliola, foreign plaster-work, terra-cotta, concrete, &c. As the book is a large quarto the plates are on a scale which allows detail to be manifest. It would be paying a poor compliment to Mr. MILLAR to say that there is more information on the subjects he treats in his pages than in any other book on plastering in the language. Compared with its predecessors his massive volume appears like a giant beside dwarfs. What is more, the information is expressed in such a way that the book is almost fascinating. The author appears to be a thorough craftsman by nature, and hence he is proud of the ability of many of his fellow-workmen. He does not puff himself, although apparently his works are deserving of praise. We imagine the book is produced through enthusiasm rather than from a desire to make

\* *Plastering: Plain and Decorative.* A practical treatise on the art and craft of plastering, including full descriptions of the various tools, materials, processes and appliances employed; also of moulded or "fine" concrete, as used for paving, fireproof stairs and architectural dressings; together with an introduction treating of the history of the art, with numerous examples. The whole fully illustrated with fifty-three full-page plates and about 231 smaller illustrations (comprising 506 figures) in the text. By William Millar, plasterer and modeller; with an introductory chapter by G. T. Robinson, F.S.A. London: B. T. Batsford.

money, for so large an amount of printed matter and so small a price will not be likely to allow of a large balance in the author's favour. The book is of phenomenal cheapness and interest, and we cordially recommend it to our readers. As an example of the comprehensive nature of the volume, we take the following description of methods for preparing architectural models :—

Various materials are used in the construction of architectural models. Cardboard or thin slabs of fibrous plaster are generally used for large, plain surfaces. Corrugated paper is useful for many parts of cardboard models. Paper models are fixed with wax, glue, wire, &c. Water-colour is used for getting any desired tint. Liquid wax is sometimes spread over cardboard surfaces on which sizes and forms of stones, &c., can be shown by indentations and modelling. French putty is sometimes used for sketch models. It can be coloured with powders, and when spread over cardboard readily takes any form of surface. It is, however, too soft for permanent work, and is only used for trial work or for temporary purposes. Modelling wax, also paraffin wax and Venice turpentine, dissolved together, are excellent materials for surfaces. Powdered colour will give any tint, and any desired texture is obtained by the mixture of suitable materials, such as silver sand, bird sand, marble dust, granite dust, cork dust, &c. Ground rice gives a fine granulated surface, and French chalk a soft, silky one. Wax gives the best results, as it takes and retains both colour and texture with permanence. Fibrous plaster slabs for the construction of architectural models may be cast to the desired sizes, or large slabs cut up to fit the various parts of the model. Mouldings may be "run down" and then fixed as required. A better way is to cast them with the slabs in one piece. Ornamental parts may be cast in a similar way, or they can be worked on the model in modelling wax, gesso, or plaster. Small models may be entirely constructed of modelling wax. A plaster core is fixed on a modelling board to reduce the quantity of wax and steady it while being modelled. Architectural models may also be entirely composed of fibrous plaster. The model is first made in plaster or modelled in clay and then jelly moulded, and a fibrous plaster cast obtained. This is a good and economical method where a strong or permanent model is desirable. The cast being in one piece, without joints, it combines lightness with strength. It can also be made in sections to show the interior. The model can be coloured as required. If necessary it may be further hardened to resist damp and wear by the same process as described for fibrous plaster.

## ELECTRICAL INSTALLATIONS.

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Continued from last week.)

### ELECTRIC POWER.

THE transmission of power in factories is one of the subjects which is always of interest to manufacturers, and is therefore worthy of the careful consideration of architects when designing a factory and its arrangements. There is the question, "Is it better to have one engine supplying the whole works, or many separate ones?" and the same question referring to boilers, &c.

The enormous waste of power in shafting is very seldom realised, and the small power taken by most machine tools is almost never appreciated. The effect of what is called "load factor" (i.e., the ratio of the work actually performed to that which would have been done if the machinery had been working at the heaviest load for the whole of the time of running) is not understood, and manufacturers pride themselves on an engine which uses, say, 2 lbs. of coal per indicated horse-power per hour, while they would be seriously perturbed if they knew the pounds of coal per actual horse-power used usefully: it would certainly be over 20 lbs. in most cases, and often forty.

This state of things is due to the fact that the dead load of shafting is usually far more than the power used on the machines. This disadvantage is often got over by placing separate and comparatively small engines in each workshop or room, thus saving the shafting transmission; but even then, if the different engines are far apart, the losses in steam piping are heavy and the steam is wet when it reaches the engines, and consequently bad economy is the result. The boilers may, of course, be subdivided, one being near each engine, but in that case more stokers would be needed and too great an expense incurred.

The inefficiency of small engines is not really grasped until proper tests are made. An example may be given of a works in which there were seven engines of from 4 to 25 horse-power each. These engines took from 36 lbs. of coal per indicated horse-power in the smallest to 8.5 lbs. per indicated horse-power hour in the largest, at a fair load.

(These results are taken from a paper read by Mr. U. C. MOUNTAIN before the N.E. Coast Institute of Engineers.)

A table giving the results of the tests on average electric motors at full load, 3.5 lbs. of coal per electrical horse-power being required (at motor terminals), is here given :—

Effective Horse-power.	Commercial Efficiency.	Lbs. of Coal per Horse-power Hour.	
		Half Load.	Full Load.
50 and over	90	4.87	3.9
40 " "	88	5.00	3.95
25 " "	85	5.12	4.10
15 " "	80	5.47	4.37
5 " "	75	5.80	4.66
3 " "	70	6.25	5.00
1 " "	65	6.72	5.38
$\frac{1}{2}$ " "	60	7.29	5.83
$\frac{1}{4}$ " "	55	7.92	6.36
$\frac{1}{8}$ " "	50	8.75	7.00

Tests on actual small steam engines in use in works at Birmingham have given the figures below :—

Maximum Horse-power.	Nominal Horse-power.	Average Indicated Horse-power in Test.	Coal per Indicated Horse-power Hour.	Probable Coal per Actual Horse-power Hour.
50	20	20	8.5	11.8
30	15	8.6	18.13	22.65
7	4	3.0	36.0	45.0

Comparing the results of the steam engines and electric motors :—

7 horse-power steam, 45 lbs. of coal; 5 horse-power motor, 5.8 lbs. per brake horse-power hour.

30 horse-power steam, 22.65 lbs. of coal; 25 horse-power motor, 5.12 lbs. per brake horse-power hour.

50 horse-power steam, 11.8 lbs. of coal; 50 horse-power motor, 4.87 lbs. per brake horse-power hour.

Thus there will be seen to be a considerable saving by using electric motors, especially in the smaller powers, instead of isolated steam engines. This saving is not the only one; it is obvious that the loss of energy in steam pipes will be much greater than that in cables conveying current. The first cost of the steam pipe is also much higher. As before explained, it is not economical to have too many isolated boilers, and consequently long lengths of steam piping are necessary in a works which covers a fairly large area.

From tests made by Mr. HY. DAVEY, M.I.C.E., on steam piping, the following results have been obtained. A steam pipe  $7\frac{1}{2}$  inches in diameter, 1 inch thick, and 1,100 feet long, steam pressure 45 lbs. per square inch, was tested. It was covered with a non-conducting cement.

This pipe condensed continually 500 lbs. of steam per hour, and 750 lbs. when the engine was working. A  $7\frac{1}{2}$ -inch pipe would, under these conditions, be supplying a 100 horse-power engine as a maximum; consequently, assuming that the engine required 30 lbs. of steam per indicated horse-power per hour, i.e. 4,000 lbs. of steam per hour, the efficiency is 84 per cent. when working, and when not working there is a continual waste of 500 lbs. per hour, or one-eighth of that required for the engine. These results are rather favourable to the steam piping, as no account has been taken of the fall in pressure when working; also the pressure is low, and a few pounds fall of pressure is a large percentage. Another point is that, owing to the low pressure of the steam, the radiation is very much less than would be the case for a higher pressure, and as a set-off against this the engine would require to be a large one to give 100 horse-power with this low pressure. An electric cable to transmit this power, with, say, a 5 per cent. loss at full load, would cost very much less than that of steam piping, and there is no loss when standing idle. It may be said that when idle the steam pipe may be shut down, but this is not the case with such a long main as this. Continual warming and cooling will cause great deterioration of the joints, &c., and even if it is shut down the loss is much greater at all loads, and especially light loads, while the loss in the cables for a motor is low and strictly proportional to the load.

Up to the present the advantage of motors for fairly large powers scattered over a comparatively large area has been discussed, and it is certain that there is a great field of usefulness for them under these circumstances.

There is, however, still another field for the electric motor—that of subdivision in the workshop or room itself. The importance of subdivision in each shop is not grasped at present, and there is perhaps some doubt as to its advisability

in all cases. It is, however, evident that, if the loss in counter-shafting is known, and if the load factor on the engine is known, and also its efficiency, it is easy to calculate as to how far subdivision is economical, and it can be worked out in any particular case.

It may be generally taken that where the machines are run continuously (such as spindles in cotton mills, &c.) there is no advantage in subdivision. When the energy wasted in shafting is small compared with the total transmitted, and the engine runs at practically full load, there is no advantage to have a separate motor for each machine to be worked, and this for several reasons. Small motors are less efficient than large ones, and more expensive as regards first cost, so it may easily happen that the interest on capital added to the cost of energy in the case of subdivision may be much more than the interest on capital and cost of energy (including the waste in shafting) in the case of a single motor.

If, however, the work done is of a discontinuous character, such as that in an engineering workshop, the load factor may be bad. In this case the total energy wasted in shafting may be large compared with that transmitted on an average, and in any case such as this it is of the greatest advantage to have electric machine tools. The actual energy required is generated, and no more. There is no loss in transmission when no work is done, as with shafting, and the interest on capital for engine, dynamo, mains and motors, added to the cost of energy, may be less than the interest on capital for engine, shafting, belting and gearing added to the cost of energy in the case of a shafting transmission.

It is suggested that several small engines about the shop will be more economical. A glance at the efficiencies of small engines and motors will show the immense superiority of the latter, and the capital expenditure for steam pipes and engines and extra boiler-power owing to the increased steam consumption will not be much less than that for the electrical apparatus. As before mentioned, it must be worked out separately in every case by an expert who is not biased in either direction.

*Plant for Transmission of Power.*—It is well to keep the mains for this purpose entirely distinct from those for lighting, as the drop in pressure allowable is greater for power than for lighting, and also there will be greater safety and a more steady light.

There are two distinct types of motor used for power transmission, the series and shunt wound, and their construction is similar to that of a dynamo.

The series machine has the qualities that the speed is almost inversely proportional to the load, *i.e.* it goes much slower with a heavy load than with a light one, but it also has a very large starting torque, and will exert a considerable force at a slow speed. These qualities at once single it out in those cases where there is no necessity for the speed to remain constant, but where large forces are required at a comparatively slow speed occasionally, and where machinery has to be started against a resistance. A few cases like this may be enumerated: machine tools, circular saws, grindstones, &c., also tramway motors, lifts and many other cases.

The other type of motor, the shunt, runs at a nearly constant speed under all loads, but the torque is not nearly so heavy and the rush of current through its armature is much larger at starting, hence it is important to start a motor of this description on a machine which has no resistance to starting, and on which the load does not vary rapidly or beyond certain limits. There are several cases where this constant speed is required, such as a motor for driving spinning machinery, workshop shafting, low-voltage dynamos for electro-plating. The reason that a shunt motor runs at a nearly constant speed on a constant voltage, is that the field magnet is weakened by armature reaction as the current increases in the armature.

The law of the motor is that the speed is such that the back pressure of the motor at that speed, added to the loss of pressure due to the armature resistance with the current flowing, equals the terminal pressure. The back pressure of the motor is the electromotive force it would generate if run as a dynamo at that speed and with the same magnetic field.

It will be seen that if the motor is to run at a constant

speed as the load increases, the back E.M.F. of the motor must decrease as the loss of pressure in the armature (due to resistance) increases to satisfy the condition that the two pressures together shall equal the terminal pressure. The field is weakened in a shunt motor by armature reaction, and with a given armature reaction it is obvious that the armature resistance should be low. In fact, if there were no armature resistance the speed of a shunt motor would even increase with the load, owing to the weakening of the field due to armature reaction.

In ordinary shunt motors, however, the speed decreases slightly, as the drop in the armature more than makes up for the field weakening.

If a motor is required to run at a constant speed under varying loads where the terminal pressure drops with the load (as in the case of a motor connected through wires of fairly high resistance to a constant pressure circuit), it may be made to do so by coupling series coils in opposition to the shunt coils of the field, and a perfectly constant or even an increasing speed can be obtained as the load increases.

Motors with series windings opposing the shunt are rather apt to start the wrong way, owing to the tendency to reverse the field at starting; consequently the series coils should be cut out entirely at starting (or reversed so that they increase the field), and switched in when the motor has attained its proper speed.

Powerful series coils are often placed on shunt motors to be used to increase the field at starting only, and they are cut out when the motor has attained its proper speed. By this arrangement the starting powers of a series motor are obtained, with the regulating qualities of a shunt machine.

*Sayers Winding.*—In connection with this subject there is a method of winding motors which has proved to be a great success on constant-pressure circuits.

It has already been mentioned, in connection with armature reactions in dynamos, that with a forward lead of the brushes the armature magnetism opposes that of the field magnets. It is evident that with a motor, as the current is flowing in the opposite direction through the armature, that the magnetism of the armature would assist that of the dynamo. It is also evident that if in an ordinary motor the brushes were given a forward lead, the sparking would be very bad, and consequently a backward lead or lag must be given the brushes in a motor to obtain sparkless collection.

In 1893 a winding was described and used by Mr. SAYERS, of Glasgow, which overcomes the sparking of motors, and in which the brush has a lead, thus making it possible for the armature to assist the magnetism of the field coils, and even to supply its own magnetism. This device consists of placing a coil between the armature and the commutator in each connecting wire. The effect of this coil is, when the brushes are given a forward lead in a motor, to reverse the current in the coil short-circuited by the brush. The current only passes through this coil when its commutator segment is under the brush. The effect of the coil is so powerful that it is sufficient to entirely suppress the sparking at a place where the tendency to spark is very high. The same arrangement applies to a dynamo, except that the brushes are given a lag.

When this winding is adopted, the design of the motor is altogether different from an ordinary one. The air gap is made as small as possible; in fact, a mechanical clearance, armature reaction is encouraged, and a motor may be run with no windings in the field. As the armature generates its own magnetism it must all be cut by the armature, consequently magnetic leakage is not encountered. In fact, the dynamos or motors are unrecognisable when compared with the usual type. The result is that, owing to the greater efficiency and lightness of the magnetic circuit, very light motors and dynamos may be made of high efficiency.

The brushes will run positively sparkless under all loads without being rocked, and so when run as motors they will give no trouble from sparking. This winding is, however, of more importance for motors than dynamos.

*Details.*—As previously mentioned there must be a resistance in circuit with a motor when started. The starting resistances of ordinary motors should be arranged on strong iron frames, the wires should be insulated by means of porcelain or stoneware insulators. There is a tendency

always to switch in a motor too quickly, and there are several electrical and mechanical devices to prevent this, and one or other should be used. There is a considerable danger of a motor, and especially of a shunt motor, being burnt out by switching on too suddenly. Care must be taken that the resistances are so placed that there is no danger from fire, due to resistance-wires becoming red-hot, and there must be nothing inflammable within some distance, or where wires, &c., could fall on to it.

The motor itself should preferably be fitted with carbon brushes, if of ordinary design, as the brush-holder cannot be rocked very well, and the sparking must be kept within limits.

Enclosed motors with ring or other automatic system of oiling are preferable for dusty and damp positions, and they should always be adopted if there is any likelihood of such conditions existing in the future, if not at the time of installation.

The motor need not in all cases be fixed to a concrete foundation. Motors of less than 2 horse-power are usually fitted by coach screws to joists, &c., and those above that size are fixed in a similar manner to dynamos. Any excessive vibration is to be avoided, and a dry position should be chosen if possible.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Professor Aitchison, A.R.A., president, in the chair.

A paper was read by Mr. J. A. Gotch on

### Heraldry of the Renaissance in England.

The author said that during the latter half of the sixteenth century, and the earlier half of the seventeenth century, there was a general desire to make much of the antiquity and respectability of one's family, and one method of doing this was to display one's ancestors. The rearing of a large ancestry was characteristic of the times. Shakespeare plays upon this foible more than once. The simple formula was—"No gentleman, no arms; no arms, no gentleman." A consequence of this was that writers on heraldry found it necessary to bestow arms on many conspicuous persons long deceased, such as Japhet, Moses, Joshua, David; even Christ himself was assigned arms. When the posthumous granting of arms to persons who could have no concern with them is considered, we can realise how far heraldry had travelled from its original starting-point three centuries before. From being matters of daily practical use, armorial bearings had become a mere indication of particular ancestry, and so by implication a mark of gentility. The next inevitable stage was crystallisation. The origin of armorial bearings being forgotten, the application of them tended to become illogical, and heraldry gradually declined, both as a science and as a decorative art. The drawing became too realistic, and lost its proper conventional treatment; the bearings were depicted in the round instead of the flat. Another cause of deterioration arose from its becoming an indication of ancient descent, one of the signs being many quarters to one's shield. The scale of each coat was so reduced as to render spirited drawing impossible. An achievement of the Knightleys in the hall at Fawsley, Northamptonshire, contains 334 quarters, which is 330 too many for decorative effect. But although the heraldry of the Renaissance contained within itself the germs of its decay, it flourished vigorously enough. Buildings, ceilings, chimneypieces, windows, books, displayed the owner's heraldry, and its use in monuments must have mitigated grief. In employing heraldry there are, of course, certain rules and regulations which have to be observed, but, within their limits, the more freedom the better; in fact, freedom is essential to decorative effect. For instance, the rule was that a bend must occupy one-fifth of the field. But the width of the bend ought to depend upon the space occupied by the charges on either side of it, and on the fact of its being itself charged or not, always bearing in mind that it must not be so narrow as to become a bendlet. Another rule was that the chief must occupy one-third of the field; but here also the depth must depend upon the charges in the field. So, too, in the drawing of charges themselves. The characteristic charge that distinguishes the coat must be preserved, but within that limit it may be treated according to the taste of the designer. For instance, a lion rampant must always be made a lion rampant, but there is no need to have his head and his four legs in precisely the same relation to each other, nor need his tail always take the same curves. These things may be varied according to the space to be filled. Broadly speaking, the treatment may be as free as possible, so long as no

new idea is introduced. Thus the lion rampant is one idea; the lion salient (or about to spring) is another. The lion rampant always looks in the direction in which he is going; but if you change the idea and make him look towards the spectator, he becomes a lion rampant gardant. A lion rampant, if he has to fill a tall narrow space, will be thin and long and very upright; if he has to fill a comparatively square space, he will be thin, it is true, but less thin, shorter, and not so perpendicular in attitude; but in both cases he will be rampant.

Of the usual adjuncts of the shield, namely, the helm resting on its upper edge, the crest and wreath on the helm, and the mantling forming, as it were, a background and frame, the treatment should be founded on logic—that is to say, the crest and wreath must accompany the helmet, and not float in mid-air just above the shield. The mantling must be treated as a kind of cloth puggaree, with two sides, which usually are of different colours. Subject to this fundamental idea, its folds and curves and cuts may be arranged purely for effect, but it is obvious that its two faces being of different colours is a most important factor in the scheme of design. When supporters are introduced they ought to stand upon something, and that something should be more substantial than the edge of the ribbon which displays the motto. They should also look as though they were actually supporting the shield and helm, and doing it in a resolute and respectful manner. They ought not to be depicted, as the lion and unicorn sometimes are, as though they were lying down and taking a rest. The designer must be a skilful draughtsman, combining vigour of pencil with a strong feeling for anatomy; so that if an animal has to be drawn its particular characteristics may be presented in a truthful though conventional way, with as few strokes as possible. The designer, too, should have the rationale of heraldry at his fingers' ends, not necessarily a long or tedious thing to do. But when he is properly equipped he will find few fields of design more attractive or lending themselves in a greater degree to pure enjoyment of making lines express beauty and fancy and force.

Several illustrations were shown which exemplified the applications of heraldry to buildings, tombs, seals, &c.

Mr. J. M. Brydon said the subject was one in which they were deeply interested, for they had often to deal with heraldic representations. They were bound to consider heraldry in its historical as well as in its decorative aspect; the latter appealed to them more strongly. He proposed a vote of thanks to Mr. Gotch, and he thought it was a most delightful sequel to Mr. St. John Hope's paper read at their last meeting.

Mr. St. John Hope, in seconding the vote, said he agreed with the author that the multiplicity of quarterings was fatal to heraldic representation if considered as decoration, although in a historic sense the quarterings might be of great interest. But of course they could only appeal to a few, while decoration charmed all who looked on it. It was a disadvantage at least for metropolitan students that fine shields were not to be seen within easy distance, and therefore if room could be found for a collection of casts of shields at one of the museums would be of great advantage; impressions of seals would also be of service, and comparisons could be made without much trouble.

Mr. H. H. Statham said he did not profess to have any special knowledge of the subject. Although heraldry had ceased to possess its old value as a study, it was not exhausted. It seemed to him that the species employed were rather few, and apparently there was a field for utilising a larger variety as supporters and for crests. The architectural effect of heraldry was unquestionable.

Mr. Gotch returned thanks.

It was announced that the next meeting would be held on April 12, when Mr. H. H. Statham will read a paper on "The New Government Office Scheme."

## THE PHILOSOPHY OF HERALDRY.

A LECTURE was delivered last week before the York Architectural Society on Heraldry by the Dean. The two fundamental principles which underlay genuine heraldry were, he said, dignity and heredity, and all its many and complex signs were intended as expressions of these. Heraldry must necessarily be ornamental, the display of bright colours and quaint forms and strange creatures could not be anything else, but the object of heraldry was not ornamentation, and if banners became gay and shields brilliant, that was the accident or the inseparable consequence thereof, not the purpose. For those who had eyes to see and could decipher the significance of these things they were tokens that the bearers thereof were either persons specially honoured by those who had the power to confer honour, or were by heredity, descent, or affinity related to those who had been so distinguished—in other words dignity and heredity. The spirit of the present age was rather to disparage, distort, or condemn either or both these

things, and the outcome was that modern heraldry was for the most part a mere frivolous fancy, which meant nothing more than the caprice or taste of those who employed it, or a careless appropriation of that to which they were not really entitled. Hence modern heraldry was rapidly degenerating into chaos and confusion, and ceasing to be worthy the attention or employment of any persons of intelligence or self-respect. People seemed to fancy that the bare fact of their surname entitled them without any further inquiry to the armorial bearings associated therewith, and thus the strangest and often most ludicrous confusion took place. That, however, was not heraldry. A man's right to do so must depend, on the one hand, whether he could prove his blood relationship to the family whose arms he had chosen, or whether he was empowered by the duly recognised authority to take any particular form or figure as his cognisance; in fact, it depended, as he had already said, on dignity and heredity. There was a tendency, he knew, in these democratic days to speak slightly of the one and the other, and to profess to look down upon them alike with lofty contempt, but experience showed that people were as eager to acquire titles or to court titles as ever they were, and certainly there was no lack of self-laudation, self-advertising, self-asserting. A strong appreciation of them was really common to the human race from the earliest ages, and heraldry was an honest and by no means unsuccessful attempt to bring and to keep them in something like order and under proper restraint. There was very little definite trace of heraldry before the Conquest, but the Crusades, with their romantic and exciting episodes, furnished many occasions for acts of personal courage and devotion, and it was a very simple and natural proceeding that these should be commemorated by some appropriate figure depicted on the warrior's shield, thus distinguishing who and what manner of man he was when his features were concealed behind the iron bars or plates of his helmet; and equally natural that the practice should be continued during the reigns of the Plantagenets, when there were incessant wars amongst the nations of Europe; and equally natural also that as the feudal system became established the great barons should not only assume such tokens for themselves, but grant to their followers distinguishing signs either similar or bearing some resemblance, so that their fidelity might be secured and their allegiance recognised. The importance of bringing these under supreme control would in due time also naturally become apparent to the reigning power, and therefore in the early centuries the *Curia Militaris* was established, or court of the earl marshal, who, assisted by various officers, heard and decided complaints and appeals, examined and settled claims, and made grants of armorial bearings to those who were deemed worthy to receive them. This soon became a complex and difficult matter, for, as the claim of the sons to retain the honourable distinction granted to their father was recognised, and armorial bearings became hereditary, it was necessary to protect families from any appropriation by others of that to which they were entitled, and which would cease to have any distinguishing value if it became common property, which any could assume as they pleased. Again, it became necessary to grant some minor distinction in form or colour on, or of the coat itself, which would distinguish to what branch of any particular family persons entitled to bear the family coat might belong. Thirdly, in course of time it was deemed equitable that daughters should not lose their share in the honours of their fathers by marriage, but might associate their family arms with their husbands upon his shield, and also, if heiresses, might with the family estates transmit also the family honours to their descendants. All this required a code of laws and observances, and special officers appointed by and responsible to the king, and in the reign of Richard III. these were incorporated under Royal Charter into the College of Arms. The Dean having referred to the powers which the College acquired of taking notice of moral and social offences, said that the rapacity of the heralds brought about a decline of that power, and by the sixteenth century the Herald's College had subsided into its present condition. Proceeding the Dean said that heraldry had become the clue of the social or family history of England, and helped the student of our country's past to trace the cause of the effect, to unravel many complications, to discover the secondary causes, and demonstrate the motions which had influenced, actuated and developed many proceedings eventually of national importance. He at least had found heraldry to be a wonderful exponent of history. He believed that our present constitution and government, social order, national character, disposition and taste were the accretion of events and actions which had happened in days gone by, and he liked to examine them, to study the chief actors, to find out who they were and what they were, why they became what they were, and why they did what they did. He learned how God's good providence overruled much thereof to very different ends and results than they themselves anticipated, and often brought out of that which was purely selfish, temporal, worldly, and sometimes utterly unworthy, that which was for the good of the nation at large, and in which we had a share in the pre-

sent day. Heraldry was helpful to all that; it was the rivet which clinched the link once forged, the means which handed on from generation to generation in families, and from age to age in nations, that which should not be ignored or suffered to lapse into oblivion. But then heraldry, if it was to be maintained, must be a reality, and not a mere sham. If people, as he had stated, appropriated armorial bearings without justification, that was not heraldry. It was a mere caprice, if not a reckless attempt to impose on other people. It meant nothing, and it was worth nothing, and he thought it was unworthy of anybody. As members of an architectural society, he thought his hearers had an interest in protecting heraldry, as well as architecture, from being abused, debased, and perverted, and in preserving them as the handmaids of the history of the past.

### THE CUSTOM HOUSE, DUBLIN.

THE discussion which has arisen in the papers over the closing up of the east colonnade of the Dublin Custom House recalls to mind, says the *Irish Times*, the singular history of the building of that fine pile. Most intelligent Dubliners know that its architect was named Gandon; how many that it was only part of a great scheme for making Dublin a beautiful city, conceived by the Right Hon. John Beresford, second son of the Earl of Tyrone and brother of the Marquis of Waterford, one of the most remarkable men of his time? Mr. Beresford was a member of the Privy Councils of Great Britain and Ireland, member of Parliament for Waterford County for forty-four years, and Commissioner of the Revenues in Ireland for more than thirty. He was a man of indomitable will and great ability, and backed as he was by family interest second to none, he enjoyed more power than any single individual in the country. Indeed, it was said of him that he had the law, the army, the revenue and a great deal of the Church in his possession, and that he might be considered the King of Ireland. Why has such an unique figure passed out of the public memory? The late Mrs. Atkinson, in an essay published many years ago, expressed herself as decidedly of opinion that it is due to the cruel way in which John Beresford's third son, John Claudius, did his part in the suppression of the Rebellion of '98. "As was remarked by a worthy man," she writes, "who, himself an Irishman of the truest blood and feeling, had while serving in the employment of the Waterford family many opportunities of observing the high spirit, generosity and other good qualities of the race—'John Claudius ruined the Beresfords.' Be that as it may, John Beresford is forgotten. And yet he ought to be remembered in Dublin as well as Baron Haussmann is remembered in the capital of France. His scheme was certainly a very ambitious one. At that time communication between the Sackville street side of the river and the neighbourhood of the Parliament House was carried on by boats; the bridge nearest the sea was Essex (now Grattan) Bridge; beside this, on the east side, stood the old Custom House, and a little way off the fine Exchange was nearing completion. The Government and municipal offices were in the same locality, as well as the theatres and the warehouses and residences of the merchants and traders. From Essex Bridge to the sea the river followed its course, for some distance confined by walls, but for the rest of its way by irregular banks, reduced in places to swamp by long neglect and tidal inroads. Mr. Beresford's splendid design was to widen and extend the quays and to open an uninterrupted line from the site of the old friary of St. Saviour, near which the site had already been marked for the present Four Courts, to the low-lying waste which stretched seawards beyond the point where Sackville Street was lost in lanes struggling down to the riverside. Here he meant to throw a bridge over the water, and from its southern end to lay out a handsome street running to the Parliament House, like Westmoreland Street as it is at present. Finally, his plan included the erection of a new Custom House half a mile nearer the sea than the old structure at Essex Bridge.

This latter proposal was met with the fiercest opposition on the part of the Corporation, many of the merchants, and what Mr. Beresford himself described as "the most desperate of the mob." The change, it was protested, would injure the trade of the city; there would not be sufficient room for shipping; in any case it was only a madman who would attempt to erect such a structure on a morass. John Beresford, however, had made up his mind on the question, and the clamour failed to change his purpose. He succeeded in getting an order from the Treasury at Whitehall to build the Custom House, and in James Gandon, the grandson of a French Huguenot, settled in London, he found an architect by whose talents he trusted to produce a design worthy of his great purpose. In January 1781 he wrote to the architect that all was ready, and that he had made arrangements to take the land, in a low situation, urging him at the same time to come to Dublin at once. Gandon came and found himself in a curious position for an architect. As a matter of fact, he had to remain in a kind of imprisonment owing to the

opposition to the scheme, and was only able to visit the site secured for the building at unearthly hours of the morning. After some delay with reference to the purchase Gandon was instructed to begin work, and to get clerks and assistants from London. He held a meeting of the principal Dublin artificers, and, finding he could rely on them, proceeded with the opening of the trenches. On the Sunday following hundreds of people assembled on the ground, but instead of filling up the trenches, as was feared, they swam in them. The attitude of the opposition at this period seems to have been that, as it was certain no building could be erected in the swamp, the best thing to do was to humour John Beresford's crazy notion. But when it was seen that the foundations were going on it was quite a different matter. Up got the High Sheriff in his wrath, and with an influential member of the Corporation marched at the head of a rabble with shovels and saws to the ground, and levelled a portion of the fence. John Beresford received news of these proceedings on a Saturday, and we can imagine its effect on his mind when we learn that he immediately wrote to Gandon to replace the enclosure instantly, to make the holes and set his poles the next day, Sunday, and to put the fence up as fast as it was pulled down. "Prevent all opposition," he said in conclusion, "and laugh at the extreme folly of the people."

There were other interruptions of the work, but it steadily proceeded nevertheless, and the building was opened for business in 1791, ten years after the laying of the foundation-stone. In the meantime, Gandon, who had a great admiration for Ireland, though given a tempting offer to go to St. Petersburg, settled down in Dublin, where he made many friends. As for John Beresford, it is pleasant to think that before his death in 1805 he had seen almost completely realised his dream of a splendid city, with noble streets and stately buildings, rising beside the waters of the Anna Liffey.

### THE WALLACE COLLECTION.

THE gross value of the estate of the late Lady Wallace has been estimated at 752,472*l.* and the net value at 701,532*l.* The amount is exclusive of the collection conditionally bequeathed to the nation. The value of the personal estate of the late Sir Richard Wallace, inclusive of the value of the collection, was sworn in 1890 at 963,516*l.* The collection was then presumably valued for probate at about 250,000*l.* or 300,000*l.*

Lady Wallace by her will bequeathed to the British nation her pictures, porcelain, bronzes, artistic furniture, armour, miniatures, snuff-boxes and works of art which are placed on the ground and first floors and in the galleries at Hertford House, on the express condition that the Government for the time being shall agree to give a site in a central part of London and build thereon a special museum to contain the said collection, which shall always be kept together, unmixed with other objects of art, and shall be styled "The Wallace Collection," but this bequest shall not include personal and modern jewellery, trinkets and effects, nor ordinary modern furniture or chattels, but shall include the Louis XIV. balustrade at Hertford House, which the executors are to replace by an ordinary modern balustrade, and the said Louis XIV. balustrade shall be used in the new museum to be erected for the said collection. The testatrix declared that if any doubt shall arise as to whether any object shall form part of the collection or not the question shall be determined by the executors of her will, and their decision shall be final; and she further declared that the said bequest is made subject to the express condition that Her Majesty's Government for the time being shall nominate Mr. John Murray Scott to be one of the trustees of the said collection for the nation, and also that during the time the said collection shall remain at Hertford House (which shall not exceed a period of four years from the date of her decease) it shall be at the risk and peril of Her Majesty's Government, who shall also defray the cost of superintendence and preservation of the said collection.

The codicil, made April 24, 1895, to the will of Lady Wallace contains the following further conditions:—

"Whereas by my said will I have bequeathed to the British nation a collection of pictures and works of art as described therein, now I hereby declare that the said bequest is made subject to the express condition that the British Treasury shall within one year of my decease remit or repay to my estate the amount of probate, estate, or any other duty leviable in respect of such collection, and shall indemnify my estate against any claim that may be made thereon in respect of such collection. And also that the said Treasury shall remit or repay to my estate any duty which might be claimed by them in respect of my 'immobilia' in France or the proceeds of the sale thereof."

In the House of Commons on Tuesday last Mr. Massey-Mainwaring asked the First Lord of the Treasury when he would make his promised statement respecting the terms attached by the late Lady Wallace to her gift of the Wallace

collection to the nation; was the gentleman now examining the collection acting on behalf of the Government, and what were his instructions; and would the First Lord of the Treasury undertake that if it was proposed by the Government to make a selection from the whole collection bequeathed, such selection should not be placed in the hands of any one individual, but should be made by a competent committee of twelve persons?

In reply Mr. Balfour said that the question whether any object at Hertford House is included in the bequest is to be decided by the executors, and Her Majesty's Government have no power of selection. By the courtesy of the executors it has been arranged that in the case of any articles as to which they themselves feel any doubt, two experts—one nominated by Her Majesty's Government and one by the executors—shall examine the article and report their opinion to the executors, with whom the decision rests. Mr. Woods, of the firm of Christie, Manson & Woods, will act for Her Majesty's Government.

### LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE ninth ordinary meeting of the Leeds and Yorkshire Architectural Society was held last week, at the rooms of the Society, Leeds Institute, Cookridge Street, Mr. W. Watson, of Wakefield, retiring president, occupying the chair. The following gentlemen had been nominated at the previous meeting as officers for the session 1897-98, and they were elected, on the motion of Mr. C. W. Tomlinson, seconded by Mr. Richard Wood:—President, Mr. George Corson; vice-presidents, Messrs. W. S. Braithwaite and W. A. Hobson; hon. treasurer, Mr. W. H. Thorp; hon. librarian, Mr. W. H. Beevers; hon. secretary, Mr. F. W. Bedford; members of council (in addition to the permanent members), Messrs. T. Butler Wilson, C. B. Howdill, W. C. Hall, A. E. Kirk, George Atkinson and James Ledingham (Bradford); auditors, Messrs. H. S. Chorley and W. Pott.

Mr. W. S. Braithwaite moved a vote of thanks to Mr. Watson for his services as president during the year, and expressed his personal regret that he had not seen his way to accept office for another twelve months. The Society was called the Leeds and Yorkshire Architectural Society, and in Mr. Watson the members who resided in districts outside Leeds had had a fitting representative. He was sure all the members would thank Mr. Watson warmly for his services, and would hope that he would continue to take the same kindly interest in the Society that he had displayed hitherto. Oftentimes, at trouble to himself, Mr. Watson had come amongst them, and it was a pleasure to know that he would still remain on the council of the Society. Mr. Braithwaite went on to express regret that the Society was not making more headway. In the year on which they were entering the Society would attain its majority, and he thought the council might consider what steps could be taken to enlarge its borders.

Mr. W. A. Hobson seconded the resolution. Mr. Watson had, he believed, been a member of the Society ever since it was started, and in coming, as he had, from a distance to attend their meetings so regularly, he had set an example which might be worthily followed by other members. They were greatly indebted to him for his services during the past year, and they thanked him very heartily.

Mr. George Corson, the president-elect, supported the resolution, and, while expressing his sense of the services rendered by Mr. Watson, joined in the expression of regret that he had not been able to accept office for another year. He had also, he said, to thank them for electing him as president, in succession to Mr. Watson. As the Society would attain its majority that year, and as he was its first president, there was, perhaps, some fitness in his being elected again at this juncture. They had a membership of 120, and he thought they might put their heads together to do something to secure a better attendance. As it was also the jubilee year, they ought to endeavour to celebrate the occasion in some form—festive, if they liked—because, when another twenty-one years had gone over many of them might not have the opportunity of joining in such a celebration.

The resolution was then carried.

Mr. Watson returned thanks, and said he should always take a lively interest in the work of the Society. He regretted that they had had such small attendances at their meetings, and thought the younger members in particular ought to take more interest in the Society, and to attend in larger numbers. He hoped this would be the case in the coming session.

The proceedings then terminated.

M. Faure, the president of the French Republic, will not be able to attend the inauguration of the last Salon, which will be held in the Palais de l'Industrie on the 23rd inst

## NOTES AND COMMENTS.

THE REV. DR. SPARROW SIMPSON, Sub-Dean of St. Paul's, who died a week ago, was a zealous member of the cathedral body. His three books, "Chapters in the History of Old St. Paul's," "Gleanings from St. Paul's," and "St. Paul's Cathedral and Old City Life," were almost revelations. The cathedral church was not sufficiently esteemed by the citizens of London, but Dr. SIMPSON's books were so interesting as to impart a new character to the building, and to recall its predecessor. His researches were a delight to himself. The Archdeacon of London said on Sunday that when he came to the library it was not in good order. Dr. SIMPSON "strenuously reformed it, catalogued it, and added to it year by year with judicious sympathy. All its treasures, contents and peculiarities were part of his daily life." He held the librarianship from 1861, and was Sub-Dean from 1881.

ONE of the incidents recorded in Dr. SIMPSON's last book has new interest at the present time. In 1708 Queen ANNE visited St. Paul's to return thanks for MARLBOROUGH'S victory over the French near Oudenarde. A rumour got afloat that an attempt was to be made to remove a number of screws and bolts from the roof of the church in order that the beams might fall upon the Queen and the members of the Ministry who accompanied her. Dr. SIMPSON discovered a tract in which it was said that ROBERT POPE, an under carpenter, saw a man unscrewing the iron bolts of the west roof; but the rumour was utilised as a libel against WREN, for it was said that the bolts were to be found in the stores, having either never been put in or were taken out again to be made more fit, and it was no wonder if one workman saw another unscrew some of them. Another replied that "all the bolts quite through the roof were actually fitted and screwed into their places in the timbers in such manner and with such care as not to be unscrewed and taken out but with an engine; and yet, after this, several of these bolts were unscrewed and taken away, and to this the affidavit of POPE relates and not to anything done to the bolts when lying in the stores, it being impertinent and senseless for one workman to accuse another of doing what was his proper business; and though a jest was made of the 'Screw Plot,' yet the cheating of the Church and stealing its material is, I take it, a matter of earnest." Dr. SIMPSON considered the "Screw Plot" was a mere fable, but there must have been dissatisfaction at the time when such a fable was possible. There could not be a better test of the difference in loyalty and sense of security between our time and that of the eighteenth century than the fact that no alarmist out of a lunatic asylum would venture to suggest that St. Paul's would become a source of danger on June 22, 1897.

ONE of the most puzzling problems is to ascertain the ratio between artists' fees and the cost of works at different periods. An attempt of the kind has been made in Berlin, *à propos* of the memorial of the Emperor WILLIAM I. For that work the Reichstag voted a sum of 4,000,000 marks, and the expenses, it is believed, will not exceed that sum. Professor REINHOLD BEGAS has received one-fourth of the amount, but as he has not furnished a debit and credit account—nor should he be expected to prepare one for the public gratification—it cannot be ascertained whether he has gained or lost by his great work. But it may well be doubted whether his commission was as profitable as RAUCH'S when he executed the fine memorial of FREDERICK THE GREAT which is so prominent an object in the Unter den Linden. The payment was arranged differently. During the twelve years he was engaged on the work he received 3,000 thalers annually, and he was therefore able to devote himself to his task without anxiety. On the completion of the memorial he received 20,000 thalers, so that in all he obtained 168,000 marks, which was a fourth of the total cost. But the money, amounting to over 8,000%, was mainly for his own services, while Professor BEGAS has had heavy disbursements. SCHLUTER, the sculptor, was paid 2,000 thalers for his design for the memorial of FREDERICK I. or the "Reiterbild des Grossen Kurfürsten," which is so prominent an object

on the Lange Bridge, near the Schloss, in Berlin. About the same time he was entrusted with the superintendence of the enclosure of the royal palace. He received from 800 to 1,000 thalers yearly, but whether that was for sculpture alone is uncertain. It is calculated that he was rewarded with 11,000 thalers, or 33,000 marks, which would be about one-eighth of the cost of the most excellent example of German sculpture in the beginning of the eighteenth century.

MR. RUSKIN has written so much and under varying moods, it is no wonder many people desire to have a summary of his theories within a reasonable compass. The publication of a fifth edition of Mr. MARSHALL MATHER'S "John Ruskin, his Life and Teaching" (F. WARNE & Co.), is evidence that the little book has been successful in supplying what was needed. The author does not attempt to criticise. He declares himself to be "a RUSKIN worshipper," and on that account he is more fitted for his task; as he endeavours to be faithful in expressing the master's doctrines. There can be no doubt about Mr. MATHER'S loyalty or care. His epitome will form a suitable guide to all who contemplate a course of Ruskinism. It is difficult to realise Mr. RUSKIN'S power as a writer from short passages, but he has said he was punished for attaching too much importance to style, since readers gave more attention to how he expressed himself than to what he said. On that account it will be advantageous to discover the nature of his theories when described in the briefest and simplest manner.

AN exhibition is to be held next year in Omaha. One of the chief attractions will be "a silver palace," which is to be erected from plans by Mr. BEMAN of Chicago. The building will not be a miniature structure. It will be 400 feet square with octagonal towers. The style is to be Gothic, apparently of the Venetian type. There will be also a central tower rising to a height of 250 feet. The quantity of silver which will be necessary has to be ascertained. Sufficient experiments are not yet made to determine what thinness the plates can be rolled to with safety. It was originally proposed to employ a sort of silver paint, but that did not correspond with American ambition. The miners, it appears, are prepared to supply sufficient silver, which will be accepted as a loan, and when the Trans-Mississippi Exposition is closed will be returned to the lenders. The idea is novel and it is a pity the project was not originally brought before the authorities of the Paris Exhibition of 1900, who are in need of novelties.

THE catalogue of casts issued by CHAPMAN & HALL, LIMITED, is worth the attention of masters and committees of schools of art. They comprise Classic, Mediæval, Renaissance and Modern examples. Some are taken directly from life. As illustrations are given it is easy to judge of the character of the casts. It is also an advantage for students to be able to select examples which they may prefer and which can be made auxiliaries in self-instruction. The net price is given in each case.

THESE houses are in course of erection in a new road adjoining the well-known Downs, and are built of native stone with portions tile-hung, the roofs being covered with Broseley tiles. The accommodation comprises three reception-rooms, with seven rooms on the upper floors, together with the usual offices. Each pair of houses in the road is different in design, although conforming to one general style, and have all been erected from the designs of Mr. H. DARE BRYAN, of 38 College Green, Bristol, architect to the estate.

## SALISBURY CATHEDRAL.—II.

IT is sometimes said that the cathedral of Salisbury is without historic interest. What is suggested is that the building is without any relation to the history of England. The bishops, however excellent, could number few statesmen among them, and it was not necessary to transact any business of political importance in the cathedral. GILBERT BURNET, who ruled the see for a quarter of a century, was one of the busiest and most garrulous of politicians, but, as well as we remember, he does not once condescend to mention his cathedral. Nor is there a record that he was visited in Salisbury by any courtier of importance. Until modern times the city was, as it were, outside the world, and ambitious prelates were disposed to avoid it. On the other hand, it seemed to be the most suitable place for Apology-making JEWELS to train Judicious HOOKERS and send them on their several ways with stout staffs in their hands.

The erection of the cathedral in a place which was uninhabited was so courageous an act that to our modern notions it appears to have been hazardous. We can only understand the reason for the selection by remembering that the part of England in which Salisbury now stands was subjected to several ecclesiastical changes. In the eighth century it belonged to a diocese which was ruled from Sherborne, and which comprised, in addition, the younger dioceses of Wells, Bristol, Exeter, and, we suppose, Truro also. Subsequently Salisbury formed part of the diocese of Wilton. Afterwards it was again joined to Sherborne. But in the reign of WILLIAM THE CONQUEROR it was identified with Sarum, or rather Old Sarum. The position of the cathedral of Lincoln was selected, as we pointed out when describing that building, not so much for picturesque effect, but from the proximity of the Norman castle, which was a safeguard for the organisation which the cathedral represented, and which served many of the purposes of a later university. Old Sarum became a bishop's seat for a similar reason. A castle was found there, and on the north-western side of it a cathedral was erected, which was about 250 feet in length. Bishop OSMUND, the Conqueror's nephew, was an earl, and exercised control over both buildings. His successor and relative, Bishop ROGER, who was regent of England during the absence of HENRY I., was also a warrior as well as a prelate. He possessed other castles besides Sarum. When his nephew STEPHEN came to the throne he became alarmed about the bishop's power. ROGER was arrested, and the king swore that his uncle should be starved to death unless Sarum was surrendered. The king triumphed, and ROGER died of a broken heart. Before dying he gave his treasures to the cathedral, and they were placed on the altar; but STEPHEN forthwith carried them away, and appropriated them to his own use. Sarum Castle was afterwards assigned to the Earl of SALISBURY, and his retainers were not likely to show much courtesy to their neighbours of the cathedral. In 1217 RICHARD POORE was appointed bishop, and he at once resolved to put an end to an arrangement which did not promote the peace of the Church. GODWYN, who wrote in the time of ELIZABETH, says of him:—"This bishop, considering the inconvenient situation of his cathedral see, on a place so dry and bleak, as also wearied with the often insolences and malapert demeanour of the soldiers that guarded the earl's castle, forsook the same, and, sending for divers workmen from beyond the seas, began the foundation of a new church in a place then called Meryfield." The position was about two miles from the castle, and the field is supposed to have belonged to the bishop.

Foundations could not be well commenced unless plans of some sort were prepared beforehand. According to tradition, Bishop POORE employed as architect ELIAS of Dereham, a cleric, but, as is usual in the history of Mediæval architecture, there is no certainty on the subject. The name occurs in several thirteenth-century documents in connection with buildings, and that strengthens the probability. Whoever was the architect he must have been a man of fine genius who was above the weakness of introducing startling features in order to display his invention. He was also expeditious in getting through the preliminary arrangements, for on April 28, 1220, the foundation-stones were laid. The ceremony was performed by PANDULPH,

the papal legate, the five stones being memorials of Pope HONORIUS III., the young King HENRY III., the Earl of SALISBURY, the Countess of SALISBURY and the Bishop. In preparing the plans care was taken to have more repetition of simple elements than was common with smaller works. As a result a sufficient part of the new building was completed to serve as a church five years after the laying of the foundation-stones. On the feast of St. Michael, 1225, the first section, including the choir, was consecrated by STEPHEN LANGTON, archbishop of Canterbury. Bishop POORE was immediately afterwards translated to the more important see of Durham. But it would seem that ELIAS of Dereham was allowed to continue in charge of the works at Salisbury.

ROBERT BINGHAM was the successor of POORE, and ruled the see for eighteen years until 1246. Then came WILLIAM of York, who died in 1256. The privilege of completing the work engaged in by his three predecessors was reserved for Bishop GILES of Bridport. On September 30, 1258, BONIFACE, archbishop of Canterbury, presided at the dedication festival, which appears to have attracted a large crowd, including the king, to Salisbury—"præsentibus rege et prælatorum copiosâ multitudine." Not more than thirty-eight years were required for the erection. It would, in the thirteenth century, have been impossible to erect so large a building within a period so limited if the architect did not facilitate the operations by avoiding an unnecessary variety of details. He introduced also few innovations. But in spite of the restrictions he imposed on himself, the cathedral has a power of which few can resist the influence. The late Mr. STREET has analysed the causes which have produced so much effect in the following way:—

The Isle of Purbeck was in the diocese, and there was every reason, therefore, for indulging as much as possible in the use of its beautiful marble. The introduction of detached shafts wherever possible, and which follows naturally from the use of marble, wholly changes the character of the architecture. The effect is admirable; but, on the other hand, the risk in construction was great. The variety in the plans of the clustered columns at Salisbury was very great. In the nave the common French section of a circular column surrounded by four smaller shafts is adopted, but here the shafts are detached from the centre column. In the choir the columns are surrounded by eight detached shafts. In the doorways and windows shafts are placed in various ways—in clusters and one behind another—so as to produce very deep effects of light and shade, with the advantage that, all the lines being curved, the transition from light to dark is never too abrupt. In the lady chapel this system culminates. The width is subdivided into three aisles, and the vaults are carried—one is almost tempted to say appear to be carried—on shafts so long, and so delicate and frail as to have required the very highest skill to insure their standing even during their construction, let alone standing, as they do, 650 years after their erection. The architect throughout the cathedral dispensed, as did the architect of Wells, with visible flying buttresses; he used them only under the roofs of the aisles, but in order to make the thrust on the walls less, he built his vaults with stone ribs, filling in the spaces between them with concrete made of a very light calcareous tufa. He used an unnecessary thickness of this material, but as it was extraordinarily light, his construction was generally perfectly secure, as in two or three places only has it been found necessary in later times to add flying buttresses above the aisle roofs. Beautiful as the detail of the cathedral is, there is generally some sense of disappointment in its interior. Unfortunately it is a church full of windows, and the grisaille with which these were filled is almost all destroyed. Its roofs and its walls were richly coloured, and the only portion which remained has been restored, and is no longer at all like the old in its effect. The painters, as at Chartres, painted the outside work in places, as, e.g. in the west porch and the porch to the chapter-house. In other places, as, e.g. on the concrete groining of the porch and of the nave and on the walls of the cloister, they coloured the walls and then marked them out in imitation masonry lines of red colour. The ground-plan of this great church is one of extreme beauty. It has not only the usual transept with an eastern aisle, but to the east of this a second and shorter transept devised evidently in emulation of the eastern transept of Canterbury, which itself was no doubt derived from the great Benedictine abbey church of Cluny, now destroyed, and before its destruction the only church in France in which this beautiful arrangement was seen. This eastern transept has also its aisle on the east, and is of less width and proportion than the great transept. East of the choir are three lower chapels, in which are the delicate

arrangements of clustered and single marble shafts which I have already referred to; and it was in the side walls of the centre of these three chapels that, before Wyatt's so-called restoration, there remained an arcade which for perfection of design and execution has never, I am bold to say, been surpassed anywhere in Europe. It is now built into the west wall of the eastern transept, and will ere long, I believe, be seen again in its old place. If it is possible to say so much of the interior, what may we not say of the exterior? With one exception—the destruction of the detached bell-tower which stood in the churchyard till Wyatt's time—the church is now more beautiful than it was when it left the builder's hands. Elias of Dereham might well deplore the changes which men have made in the colour of his interior. But could he see it again he would be amazed with the beauty which time has given to the exterior. There is, so far as I know, no building in Christendom on so grand a scale, which is so complete, so uniform in style, so good in the proportions of the various parts of the whole, and altogether and from every point of view, so thoroughly beautiful as this grand and most English church. Its surroundings are as beautiful. The quiet close—unknown out of England—surrounded by deanery and prebendal houses, by a bishop's palace founded at the same time as the cathedral, the whole group surrounded by its ancient wall and entered by its old gateways, is in itself a sight for an architect; but out of the greensward which surrounds it on all sides the matchless church rises, with its beautiful cloisters, its splendid polygonal chapter-house, its octagonal vestry on its southern side, in such completeness of grace and beauty as leaves nothing to be desired.

Like Wells, Salisbury is a cathedral well worthy of a young architect's study above most others. For not only will he find there the work of the mason in all its varieties; he will find, too, woodwork of all sorts, moulded, carved and plain—roofs, doors, chests, tables, choir stalls, even the great wooden wheel which was used to raise the stone for the steeple; and in every portion he will find evidence of the same sense of the necessity for completeness, which is the true mark of a good architect at all times. The detail everywhere is admirable. The carving of foliage is very different from, though in my opinion generally inferior to, that at Wells, and there is one very singular feature which is seldom seen in England. The arcades of the parapets and in many other places are carried on quite regardless of the buttresses which intersect and stop them. So that, e.g. in the front of the transepts there are arcades not regularly divided, but quite accidentally arranged with half or a third of an arch abutting against a buttress, so as to give the appearance of the buttress being an afterthought put on against the arcade.

The works cost, it is said, 40,000 marks, or about 26,666*l.*, which would be equivalent to nearly twenty times that amount in current coin. The spire, a part of the tower and the chapter-house are not included in the reckoning.

In the eyes of the public the spire is the most interesting part of the building, and in consequence painters when representing Salisbury Cathedral have not hesitated to impart to it an increase of height in order to make it appear more soaring. We need not say the architect of the building did not contemplate so lofty a spire, which to some extent deprives the building of the proportion it was his aim to secure. When it was resolved to make the addition his intention was disregarded, and although he had made no provision for supporting so enormous a mass of masonry, the risk was boldly faced. We may be thankful that the spire was not made to display fourteenth-century peculiarities, and that it did not collapse and destroy the earlier work. There is no record to define the date of the addition. As a license was granted by HENRY VI. in 1417 to permit the chapter to acquire lands of the value of 50*l.* per annum, in order to expend the money on the repair of the spire, several years were likely to have elapsed before the spire had fallen into a dangerous condition. The risks which were incurred with a light heart for the sake of effect were, however, of a kind that made ruin impend before the spire was completed. The late Sir GILBERT SCOTT gives the following account of what he discovered:—

The original thirteenth-century builders had erected a central tower rising sufficiently high to receive the roofs of the four arms of the church. The storey against which these roofs abutted is a very light structure, and was intended to be visible from within. It is perforated in its thickness by a triforium gallery, leaving externally a wall of little more than 2 feet in thickness, whilst the interior consists of a light arcade, with Purbeck marble shafts. The corner turrets have each a staircase, rendering them mere shells. On this frail structure the fourteenth-century builders carried up the vast tower some

80 feet high, with walls nearly 6 feet thick, and upon this a spire rising 180 feet more. It need not, then, be wondered that the older storey, so unduly loaded, should have become shattered. Subsequent builders have bolstered it up by flying buttresses and by every form of prop they could invent, till the sectional area of the added supports exceeded that of the original structure.

All the devices were of no avail, for in spite of buttresses, props and other supports, Sir GILBERT SCOTT was compelled to call in a civil engineer to devise a series of wrought-iron ties, passing round the stair turrets and connected with vertical irons placed on the exterior faces. But both architect and engineer did not dare to meddle with the bent piers which carry the tower. The authorities were accordingly advised "to keep a watch over the piers, and if any increased curvature should be observed, to take some precaution, such as the insertion of iron beams from pillar to pillar." The ties and vertical irons have not been much more efficient than the ironwork introduced in the eighteenth century. Under Sir ARTHUR BLOMFIELD costly works have since been carried out, but the spire must continue to be a cause of anxiety to the cathedral authorities. The case should serve as a warning to those who lightly undertake the improvement of an earlier architect's design.

### ART IN WALES.\*

I DESIRE at once, and quite unreservedly, to repudiate any claim to speak with authority upon any one of the arts, whether graphic or plastic or domestic or decorative. I am a mere wayfarer on the Queen's highway, who in the bustle of the crowd glances to right and to left to appreciate the beauty or the barrenness of the land, and any remarks which I may make to you to-night I make not as an expert, not as one who has any real knowledge or any claim to speak upon these matters, but as an observer and a wayfarer. As we look round upon the life and the activities of our day in Wales, I think we cannot but feel that we are in the glad springtime for Wales; there are buds and blossoms and flowers of promise in every sphere of the activity of the people of Wales and of the Welsh people, whether they live in Wales or over the border, and I think in a season of awakening it is right and well, and perhaps a duty on our part, to see what is the meaning of the awakening, how deep it is, and into what channels the new life which comes from the awakening is spreading itself.

I think one may say at the start—and one admits it with sorrow as well as with frankness—that not the most patriotic of us can claim for Wales the possession of a native school of art, such as is possessed in other small countries which have obtained and enjoyed the priceless gift of self-government. I remember well in 1889 spending a few days in the great exhibition at Paris. I have forgotten most of what I saw there. I have a vague recollection of the crowd and of watching many who came from the various provinces of France, and a vague recollection of the enormous wealth exhibited, the wealth of industry and of art and of commerce, and of the various activities of the great country of France. But the one thing which stands out in my memory, and which I think will stand out so long as I live, is the fact that, not alone had the great countries, France, Germany, Great Britain their separate rooms for the exhibition of the products of their art, but that Denmark, Finland, Servia, Greece and countries very much the same as Wales in population and in ordinary material wealth, had each one of them, even distant Finland, separate rooms in the great exhibition, in order to show, as show they did, the splendid products of the native art of each country. I wondered then, as I often wonder whenever I think of these nationalities now, whether it is possible that in the times to come our own country may claim a place in the galleries which from time to time will show the collective activities of the nations of the world.

But, even without this, one is glad and proud that there have been from time to time witnesses to the latent power for art in the Welsh people. It is true that many of these have shown this latent power well over the border of Wales and in other lands, but I think they have almost all shown it with a personal pride in their early training and recollections and associations connected with their life in Wales. Take, for instance, the fact, which must bring some pride to every Welshman, that the real father of the British school of landscape was Richard Wilson, who was brought up in comparatively humble surroundings in the little village of Penegoes. One of the most prolific and ablest of the sculptors who have brought glory to the British name in sculpture was John Gibson of Conway. Inigo Jones in architecture, and Owen Jones in laying down the principles of

\* An address delivered by Mr. T. E. Ellis, M.P., before the Cymmrodorion Society.

ornament, both Welshmen, have shown that from time to time there will arise from Wales witnesses to the latent power which lies in the race and in our people. In our own day we have witnesses to this same power. Were it not for a happy meeting which I had with a fellow-countryman after coming to the room to-night, I would venture to say a word or two as to the feeling of joy with which we look upon the career and the great promise of a still greater career of our countryman, Mr. Goscombe John; and, at any rate, one can (in the absence of Sir Edward Burne-Jones) express the pride which every Welshman and Welshwoman must feel that it has been left to one of Welsh blood, and who is proud of his Welsh blood and lineage, to bring forth new powers and show forth new secrets in art, in the person of Sir Edward Burne-Jones. Who can measure the wealth of the thought and reading and fine literary discrimination which is signified by the command possessed by Burne-Jones over the entire range of Northern and Celtic and Greek mythology, or the tenderness and largeness of sympathy which have enabled him to harmonise these with the loveliest truths of the Christian faith?

Before I touch upon my actual subject, I ought to refer to one other point. That is the change which has come over Wales in one respect during the last thirty or forty years in the fact that artists—not, I am sorry to say, as a rule Welsh artists, but artists from outside—have from time to time lived and settled down in Wales, in order to interpret the scenery and the life of Wales. My feeling in regard to them is one rather of sadness that the interpretation of the beauty of the landscape and of the life of Wales should be left to artists from outside, and that their products should be for a public outside Wales. Their pictures do not pass through the mind or the heart of Wales, and this must be so until we have a municipal gallery or galleries, or national gallery or galleries, where the products of these artists who have seen the loveliness of Wales can be exhibited for the wise enjoyment of the Welsh people. As it is we have neither galleries nor artists of our own, nor any means, except the wealth and good fortune and taste of an individual Welshman here and there, of securing for our people either temporarily or permanently the artistic interpretation of the landscape and life of Wales by artists who come and live in Wales or settle down there for a season.

But, perhaps, national or municipal galleries are not the main thing necessary for the cultivation among the Welsh people themselves of a sense and capacity for art. I think it quite possible that both in England and in Wales we may have at the same time the production of hundreds and thousands of paintings or pictures, and yet a deterioration of the public taste and artistic taste. I think this is largely due to the fact that art and artists on the one hand and ordinary life and industry on the other hand have, during the last century and a half, been more and more divorced, and I am convinced from what I can read and learn and observe, that we can never expect a real pervasive feeling and taste for art until this divorce between the artist and his studio, on the one hand, and the workman and his workshop, on the other hand, can be done away with, and the gulf between them be bridged over. That being so, I feel that we should not so much concern ourselves about what I may call the great master arts of painting and of sculpture and of architecture, as with the more domestic and decorative arts, to which I desire to refer to-night. For great artists and great sculptors cannot be produced, even like senior classics and senior wranglers, by great schools at great universities. They can only be produced very largely by nature's own pleasure, at her own time, and in her own way, her own, very often, quaint and striking fashion. But though they cannot be produced at schools, yet I think that the history of the art world will show us that they will arise from among the children of an educated race, cultivated in music and in literature, and of a race where there has been developed an innate instinct for beauty, derived from arts practised from father to son, and extended from valley to valley and from workshop to workshop.

I referred a few minutes ago to the divorce which the introduction of machinery and the great industrial revolution of the last century and a half have brought into the art and industry of this country. I think that that divorce has had a bad effect upon both the artists of our day and upon the workmen, the craftsmen of our day. For it comes to this, when the artist, say the architect, has great designs, noble views of his own with regard to the rendering of a great building, he makes this design in his studio, he probably submits it to some national body or to some committee, and when it is approved or accepted, it is then placed in the hands of men whom he has never known, with whom he has never come in contact, and with whom he has, as a rule, very little sympathy. I believe I am right when I say that in the great ages of production, in the ages, for instance, of the building of the great abbeys and the great cathedrals and churches of England and of Western Europe, the actual architects had in all manner of ways a much nearer touch with the actual workmen. As a matter of fact, I believe, that the artificers, the workers, of our great abbeys and churches, were housed very often in the abbey,

church, or in the very house of the great founder; very often the bishop himself was the architect. And I have no doubt that Wykeham and Gower, as well as many others, were not merely architects living in a studio, but that they were in close and constant and loving touch with the actual workmen who carved the stone and placed the wood, and found pleasure in carrying out in the minutest detail the ideas of their great master, the architect of those churches and abbeys. That is not so in our day. The artist very often takes very little interest either in the problems or in the life or in the wants of the actual workman or craftsman, and the craftsman is not taught very often, and is not encouraged to take actual personal pleasure in carrying out the ideals and the plans of his master or his architect. I venture to think that the only way in which that gulf can be to some extent bridged is by so modifying our present system of industry as to make it possible for the workman to take and to feel a personal human interest in the actual details of his work from day to day. As things are at present, owing very largely no doubt to the enormous development of machinery, owing perhaps also to the enormous extension of our great factory system, it is difficult, and in many cases perhaps impossible for workmen to use hand and brain and affection in the way to which I have referred. But I am convinced that it is our duty, so far as in us lies, to make it easy for the workmen and for those for whom homes and schools and chapels are built, to feel and to realise that it is possible to give thought and brain, the highest qualities of art, to the construction even of the simplest form of building, whether that building be a house, or a school, or a chapel, or a hall of council. And, although we in Wales cannot hope to produce at command great sculptors, or great painters, or great architects, yet I am convinced that we can very largely through our public and national system of education do much to kindle and rekindle and nourish the instinct for art in its application to industry, for beauty of design and truth in workmanship, in the mind and the life of the people, and more especially by nourishing the domestic and decorative arts, which are the handmaidens of the mother art of architecture.

You may ask me what is meant by decorative art. I would reply to that in the words of perhaps the greatest witness to the need for domestic art and to the results, and to the beauty and to the value of it to the national life, namely, William Morris. He said that the twofold office of domestic art is to give people pleasure in the things they must perforce use, and to give people pleasure in the things that they must perforce make. Now, let us apply that definition or description of the office of decorative art to two simple things, to the building of a home and to our regard for a book. I will not go to-night outside these two things. I only take them as the two that are nearest to us, as the two that are necessary to us, and as the two that during life give us the greatest possible pleasure and joy; and I must admit, as I look round parts of Wales and parts of England, that we have very much to learn from the generations that have gone by with regard to them.

In our prosperity, our love of change, our tendency to follow the fashion of the day, we have one and all cleared off from Wales most of the memorials of what native art there was. The number, for instance, of the homesteads, whether manor-houses or farmhouses or cottages, of Wales, which are old, is already comparatively small. The vast majority of the old churches of Wales have been restored out of all recognition. You can go to various glens in Wales and various country sides, where some of the very loveliest churches in this country used to be, and instead of those beautiful buildings that attract and extort the admiration even of the most aggressive politician, what will you find? Not these ancient buildings, except one here and there, but spick and span churches, that you would not really spend half an hour in crossing over fields to see. I have felt the deepest and bitterest regret in going to certain parts of Wales, where there were some of those magnificent old churches, and finding hardly a stone or trace of the old church, which has been replaced by some utterly modern and characterless building. But there are enough manor-houses and farmhouses and cottages in Wales still to show us that there was almost instinctively in the builders of these a natural taste for what was fitting and pleasurable and beautiful. Before entering these old houses, one thing, I think, strikes most observers. That is, that our forefathers in Wales did not plant their houses just in the first place that came. Many of our villages now, and of our newer houses, are just planted like railway stations, anywhere, without taking any account of their situation or anything else. But if you observe the old homes of Wales, whether manor-houses or farmhouses, or cottages, you will find that the builder has been very careful in his choice of the site. Not that, as a rule, he chose to build a house where he had the best view of scenery, because peasants do not realise usually the beauty of landscape, but he generally chose it in a spot sheltered from the prevailing wind. The house was built where there was a sense of comfort and of snugness, and instead of leaving the house bare to the four winds and to the tempests

and rains of Wales, the builder generally surrounded it by a belt of sycamore, or ash, or oak, or pine trees. I often wish that the builders of our day, the great landowners of Wales, as the case may be, or you rich London people who go down to Wales and build your houses on our hillsides, would remember these two things that our forefathers did naturally.

Before we go inside the old Welsh home there are one or two other points which are always of great interest to me—in fact, three points, the porch, the window and the chimney. It is very seldom that I see in modern houses in Wales the same charm, either of chimney or of window or of porch as in the old Welsh houses, and these are not matters to be trifled with. I think that the square, squat chimney on a house is one of the ugliest and the most portentous monstrosities that the eye can rest upon, and I feel a certain joy when I think of some of the old houses, especially some old Tudor and Stuart houses in Wales, where the chimneys themselves are things of beauty, not those square, squat piles of stone, but fine long, almost sinuous chimneys, that are a joy to look at. The windows of many of the old houses are not perhaps very regular; they are not placed, as in a good many modern houses, just like a postage stamp on a letter, but there is a certain fittingness about them; there is very often either about the shape of the window or about the casement, or the way of disposing of the glass and the lead or wood, something to attract and to please the fancy. In the porch or door one is glad always to notice in the older houses not alone the solid, honest way in which the door and its framework have been put up, but the fact that the timber itself has been thoroughly well chosen and well seasoned, which is not true of most of the modern houses, and that, instead of having handles and knockers chosen out of those made by the gross at Bilston or Wolverhampton, they have generally finely-wrought handles made deftly and honestly by the village blacksmith, which stand not the racket of a few years, but work as easily and as smoothly to-day as they did when Elizabeth was queen or Charles I. was king.

When you go inside some of these old houses, is there not a certain character about the house which is missing in our more modern farmhouses? Take, for instance, the characteristic of every old Welsh house, the great mantel over the fireplace, not a miserable little grate just stuck at one corner, but a real mantel, which is a feature of the whole room, where there is plenty of room for a fire, and where the family can comfortably sit around it at night, and not feel that one is taking the whole of the fire, and that the others have to take a back or an apologetic seat. It is a joy to me that, in what I may call the better planned houses of our own day, the houses that are planned by our greatest architects, and that are enjoyed by men of wealth and taste, this great feature of the old Welsh houses, the great mantel, is becoming, whether in the hall or in the dining-room, one of the striking and most pleasurable features. I am always glad to find also in old farmhouses, not alone that there is a noble fireplace with a fine mantel, but that there is also in most of the old Welsh houses a collection of really fine fire-irons, and, believe me, there can be the display of as much real art and taste, and honesty of design, and of workmanship in fire-irons as in most of the pictures that are exhibited at the Royal Academy. I always feel when I see these in a good many old Welsh homes that we have there the highest of the elementary requisites of art, viz. fittingness for the work they have to perform, taste in design, and thorough honesty in workmanship. Then look at the furniture. I need not recall to your memory the quite modern furniture of most of our houses, the gimcrack things they are, the miserable things without shape or form, which very quickly give way, and which have nothing in them either of character or of attraction, and nothing in them which would mark them out as forms of furniture which are meant, not alone for one generation, but for a succession of generations, so that the association and the tenderness and the love of home should imperceptibly and unconsciously be carried on even in the very furniture and the very atmosphere and surroundings of hearth and home. Take some of the features of any old Welsh house. Instead of the miserable cupboard, where the hinges very quickly come loose, and where very often the wood has been so badly seasoned that you will see cracks in various parts of even a very presuming piece of furniture, what is the main feature of the furniture in an old Welsh house? A real substantial oaken cupboard—a *cwbpwrdd tri-darn*—that is a joy to look upon; you will very often see upon it perhaps two or three letters and a date, sometimes in the seventeenth, sometimes in the eighteenth century. It is well proportioned, it is shapely; perhaps there is a dainty bit of carving on it. At any rate, it is serviceable; it has served not one generation, but eight, ten, twelve, fifteen and twenty generations in that hearth and home, and are you surprised that there should be in Wales that strong affection and attachment to hearth and home which puzzle very much the modern man, but which I think are a glory and a strength to the Welsh character and to the Welsh nation? I need not mention other parts of the furniture and economy

of a Welsh house—the dresser, the settle and many other forms of furniture which are not merely characteristic of old Welsh houses, but which, as I ventured to say before, unconsciously carry a message from generation to generation, and which add to the associations and to the wealth and to the enjoyment of a home, making it possible, I think, not merely for the most beautiful home affections to be nourished, but making it possible from time to time to have issue from those houses men and women who can and must distinguish themselves in art and in other spheres of activity. Of late years, owing to circumstances and conditions of life and tenure and law, the number of houses which are built by those who have to dwell in them is comparatively small, and we find as a result that, not merely are houses thrown up, so to speak, in our industrial districts suddenly and without much thought for anything except a quick return and a fair dividend, but that even in our agricultural and our peasant districts the person who has to live in the home is no longer, or very seldom, the builder of his own house. It may be that this is inevitable, and that we have to make the best of it, but at any rate I think it is only well to face the fact that some of our greatest teachers say that we can never hope to have beautiful homes and fitting homes so long as they are built, not by those who have to live in them, but by others, who, perhaps, have only some material or cash interest in them. Ruskin somewhere says, I think it is in "The Eagle's Nest," "If cottages are ever to be wisely built again, the peasant must enjoy his cottage and be himself its architect as a bird is. Shall cock robins and yellow-hammers have wit enough to make themselves comfortable, and bullfinches pick a Gothic tracery out of decayed clematis, and your English (and he might add your Welsh) yeoman be fitted by his landlord with four dead walls and a drainpipe? Is this the result of your spending 300,000*l.* a year at South Kensington in science and art?" Without entering into the question of the tenure of houses and land in Wales, or into that most interesting question of the future of South Kensington, I think it is interesting at any rate, and perhaps right that we should study and think over this dictum of Ruskin; for I must admit that much as busy generations and the multitude of the Philistines in this country have laughed from time to time during the last fifty years at the teaching and the dicta of the master, yet time constantly brings him its revenges, and dicta which thirty or forty or fifty years ago, and even to-day, are scoffed at by busy, prosperous, pushing men, have a curious knack of being recognised as permanent and solid truths by the more thoughtful men and women of our time. I must admit that I do feel a certain sense of void as I think of the buildings, the farmhouses and cottages of Wales, their want of character and very often also want of anything like attractiveness of form, and certainly their want of anything like personal individuality. I repeat, I feel a certain void when, as I sometimes have the pleasure of doing, I pass through Swiss or Tyrolean villages and glens, and observe how the Swiss and Tyrolean peasants can and do build themselves a *châlet*, fittingly proportioned, daintily carved with scrolls or inscriptions, and with variations of line, and form and colour which give an individuality to each dwelling.

I hope that, whatever may be the laws which govern the tenure of houses or of land in Wales, we shall do, as I am glad to find the committees of our *Eisteddfodau* do, our very utmost to impress upon the workmen and the handicraftsmen of Wales the dignity and the value and the possibilities of their everyday work. I am not to-night going to enter into the work—precious and priceless pioneer work—which the committee of the Newport *Eisteddfod* and, in a more modest way, of the Festinoig *Eisteddfod* are doing for art and handicraft in Wales. I believe that a perusal of the published programme of Newport, and a perusal also of the programme of Festinoig, give one some sense of joy that the *Eisteddfodau*, not content with instilling a love for and helping the practice of excellence in music and in literature and in poetry, are doing something, and, I believe, something substantial, to make it possible for those who build houses in Wales, those who own them, and those who work upon them, whether carpenters or joiners or blacksmiths or furniture-makers, to put thought and heart and brain into the construction of these things of everyday life and of those homes and surroundings and furniture which imperceptibly have a very great influence upon the old and young, who are trained and who live in their midst.

Having referred to one of my subjects, the home, I will now proceed to say something of our regard and care for books in Wales. Whatever may be our possessions or our want of possessions, our opportunities and institutions, or our lack of them, this at any rate is true, that there is in Wales a respect for and a love for books, and that our countrymen probably draw as much joy and comfort and strength from books as the common people of any country. Some people, I think quite a number of people, believe that any paper, or any type, or any cover is good enough for a book; they say that all they want in the book is the actual word. From my point of view, to treat a book in that way, and to say that any paper or type or cover

is good enough for it, is a form of sacrilege. It is a betrayal of the best friend a man has; it is scurvy treatment of a man's greatest comforter and best friend. For what after all is a good book? It represents the most precious heritage of the ages, it contains the highest thoughts of God, of nature, and of human things. It represents what mankind, by a curious and very sure instinct, looks upon as a permanent and imperishable treasure; and yet some would say that it is good enough for this precious heritage to be huddled anyhow into a tawdry or rubbishy cover or shoddy binding, with careless and blurred type, on cheap and nasty paper. Can we not in Wales give a nobler place, take a righter view of the value of a book, as a friend, as a comforter, as a strength to us? So far, what we have done with our books, as a rule, is to leave them in the British Museum or let them be kept, too many of them, in manuscripts at the caprice of individuals, and subject to the ravages of time and the ordinary accidents of circumstance. Happily, more and more of our books, of our permanent treasures, are being published. Can we not give a further appreciation of the value to the individual and the active life of our people of our books? Can we not, for instance, more and more encourage those who desire to place the great thoughts of the world, not on miserable paper with bad type and characterless binding, without any illustration except perhaps an engraving of some thoroughly cheap and handy reproduction from a photograph, can we not in one way or another, either individually or collectively, encourage these beautiful arts of printing well, of illustrating well, and of binding well? If individually we do this and encourage this, I believe we shall give an enormous impetus to one of the noblest forms of decorative art in Wales, and is it not high time that we should in this way treat the Mabinogion, Dafydd ab Gwilym, Ceiriog's Myfanwy, yes, and even the Pennillion Telyn and the Tribanau? These are racy of the soil of Wales; in one and all of these you feel as you read them, as you look at them, the very pulses of the life of Wales, and yet we are satisfied if we can just manage to get them in a shilling or sixpenny edition, turned out with very little care and very little trouble. Cannot we hope that our artists may find their inspiration, as English artists do in Chaucer and in the great masterpieces of English literature, in, for instance, the Mabinogion, and in illustrating what I may call the home and domestic poetry of the Welsh people? Cannot we also hope that there may be set up in many parts of Wales printing presses which shall take real trouble and go to some considerable expense in securing not the cheapest but the best type, and shall we not also do our utmost, individually and collectively, to encourage what I have always considered, and will consider one of the most serviceable and highest forms of handicraft, namely, the binding of books? I do think that a beautifully bound book is a joy in itself now and for ever to its possessor, and there is no reason whatever why in this matter a great deal of steady and speedy improvement should not be secured in Wales. There is no need for us to go through any great agitation, we have only, one and all, to do our duty towards our best friends, the favourite book of childhood, of youth and of age.

I might easily mention other forms of activity and of craftsmanship where decoration and beauty of design and honesty of workmanship come in, for instance, pottery, tapestry, even posters. I think that really one of the very many increasing joys of living in London is the enormous improvement in the posters of this great town. I feel a considerable interest whenever I go through a town in a good many things in it, in its houses, its churches, its schools, and in the faces and dresses of its people, but I must admit that advertisement hoardings in every town have as much charm for me as anything. I can see there a miniature of the life of the town, I can see what the real activity and interest of the town is. I consider that they form a very fair indication of the life and the taste and the promise of a town. I remember that after visiting one town I came away with a feeling of thankfulness for one poster that I saw pasted up on a hoarding in it. The town was that sink of iniquity, as I consider it, the town which is built just at the entrance to the Suez Canal. I believe that the human rubbish and vice of the world has been carted into a heap in this town. I think I have never seen a town with so many glaring proofs of the hideousness of the moral life of the place, and I must admit that, during my stay of a day or two there, I never felt more uncomfortable in any town. But the morning before I sailed down the canal, I came across one poster which must, I think, have been printed by an Italian printer. It was beautifully done, and on it was a call to the Italians of that town to celebrate, I think, September 20, the entry of the Italian troops into Rome in 1870. It called, in the names of Mazzini, Garibaldi, Cavour and Victor Emmanuel, on all the Italians in that town to meet together on September 20 to commemorate that striking day in the history of their fatherland. The very sight of that poster, which was beautifully printed, and seemed to me to convey a splendid image of the nationality and humanity of the Italians scattered over this vile town, gave me something like

a redeeming glimpse of the life in that dreadful place. Therefore I hope that in Wales we shall not look down upon the value of the poster, and I am extremely glad that both the Newport and the Festiniog Eisteddfod committees have offered a handsome prize for the best pictorial poster for an Eisteddfod.

There are other by-ways of activity, about which one can speak in reference to descriptive art. There are village crosses and memorials, there are memorial windows in church and college, and there are tombs. I shall not refer to-night to any of these, except by the mere mention of them, but I always feel that a very great deal can be done for the rekindling and fostering of beauty of design and honesty of workmanship in all these various features. I think nothing is more attractive in the villages where they still survive than the old Celtic crosses of the early centuries. They are silent witnesses to the generations that have passed away in those villages, and they are witnesses to this day of the beauty of the design and of the instinctive skill which a Welshman in the early, the ninth, tenth and eleventh centuries possessed. I shall be extremely glad when villagers themselves, or those who have left villages and prospered in the world and go back again, realise what a service they do to a village if they help to raise, not perhaps a village cross, but some form of village monument to those who either in the village or out of it have done credit to their birth-place and service to humanity. I was one day last summer in an out-of-the-way little village called Llansannan, which is considered to be a completely out-of-the-world place. There you find at the present day some of the most characteristic Welshmen in the whole of Wales. There you find a certain freshness and vigour of spirit and of activity and a great deal of splendid conservatism on the part of the villagers and the peasants, and I felt as I looked upon the open square of the little village that it would be a real addition to that village, and something that would perhaps kindle the young mind there, if a fitting monument, say a Celtic cross, such as you find in Pembrokeshire and in many parts of Ireland, were raised in honour of the men who have been reared in that parish. Four names at once occur to me as being worthy to be placed side by side, or one after another, on such a village cross. For a parish which has produced at various ages Tudur Aled, William Salesbury, Gwilym Hiraethog and Henry Rees is a parish which can be very proud of itself, and a parish which ought, I think, to rear for generations of its children a monument to show that it appreciates the services which men who have been reared and who have lived in that parish have rendered, not only to that countryside, but to the whole of Wales, and some of them to humanity.

To sum up these stray thoughts of mine, I would say that our duty is, first of all, to banish from our minds the idea that art is something really confined to painting and sculpture, and to impress, in season and out of season, by word and by deed, that the only real hope of art is in its constant application to industry and to everyday life. I would further say that it is our duty in our national system of education, in our primary schools, in our secondary schools, and still more in our evening continuation schools, to impress the necessity for manual training, for training in the use of tools, and for training in various handicrafts. I would further say that we should give every possible encouragement to the suggestion, for instance, which was made at a Cymric gathering by Professor Herkomer, that we should not alone rely upon manual training and training in the use of tools and in handicraft in our schools, but that there should be raised in Wales one or two or three schools of art and craft, where workmen and others can be trained, and from which we can hope to secure an adequate and permanent supply of well-trained teachers. I think also that we should, so far as possible, by this means and by other means encourage the establishment and the fostering of home industries, of village industries in Wales. This does not imply at all any piratical desire to upset what I suppose must be the normal and permanent system of industry in this country by factories and by machinery, but there is still ample and abundant room for the development of handicraft in wood, in stone and in metal. If one asks how this can be done, all I would say is this: it cannot be done suddenly and quickly, the development of taste and gradual accumulation of hereditary skill, and the diffusion of right ideas of design and of art among a people, cannot be achieved by passing resolutions or by plébiscite, it can only come by education, by right ideals and by patience. If we have right ideals, if we give the right encouragement and if we persist in well-doing, then I think we deserve the right to look forward steadfastly and hopefully to the dawning of that fuller and ampler time when the cottages of Wales, when the halls of council of Wales, when the schools where the young of Wales are trained, when the temples where the manhood and womanhood of Wales pays homage to the powers that guide it and create it and maintain it, when all buildings and all products of the national mind shall show that there is a real vitality in the national art of Wales, in that art which shall mirror not only the bright fancy of the Celt, but also that spirituality and that serious outlook upon life which characterise the Cymry.

## GLASGOW INSTITUTE OF ARCHITECTS.

THE usual quarterly meeting of this Institute was held in the rooms, Pitt Street, on the 25th ult., Mr. John Jas. Burnet, president, in the chair. The President reported that the Council had remitted the question as to the lighting of the Lower Church of Glasgow Cathedral to a committee of Council. He also reported that the Corporation of Sheffield had appointed a jury of three members of the Sheffield Society of Architects as assessors to adjudicate upon competitive plans, and that it had been remitted to a committee of Council to consider the position of this Institute with regard to architectural competitions. The President also intimated that the Council had appointed himself and the Vice-President as delegates to attend a meeting of the Sanitary Congress to be held at Leeds in September. Mr. Colin Menzies, 2 West Regent Street, having been recommended by the Council, and being approved of by the meeting, was elected a member of the Institute. Letters from Messrs. Honeyman and Leiper, acknowledging in gratifying terms the congratulations of the Institute on their election as academicians, were read. Letters from Mr. Gourlay regarding the examination of drawings for the Technical College prize were read, and it was reported that the prize, which was to be called the Institute of Architects' prize for the best set of drawings and sketches, had been awarded to Mr. Wm. S. Moyes, whose drawings were extremely creditable. The secretary reported that it had been remitted to a committee of Council to consider as to a curriculum of architectural education.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

THE Edinburgh Architectural Association visited, on the 27th ult., Hatton House, Mid-Lothian, by the kind permission of the proprietor, the Earl of Morton, and the tenant, Mr. James M'Kelvie, under the leadership of Mr. Thomas Ross, F.S.A. The house, it was explained, has a massive central keep, with later additions round it. In the time of Robert II. John de Haltoun was proprietor, and in a few years it passed to the Lauder family, the Lauders of the Bass, in whose hands it remained for several centuries. The Lauder family were implicated in the assassination of the Earl of Douglas, and incurred the deep resentment of that powerful family, who captured the keep, but were ousted by the timely assistance of the king, who sent the "great bombard," supposed to be Mons Meg, to the help of the Lauders, who, again obtaining possession, were permitted to re-edify the keep. Early in the seventeenth century Charles Maitland, brother of the Earl of Lauderdale, and a well-known officer of State in Scotland, became proprietor, and began the extensive additions of which much remains. He appeared to a certain extent to have copied his brother's manner of laying out the gardens at Ham, and the work which was carried on by his successor had made the house with its gardens, terraces, sundials and statuary, one of the most interesting and pleasant in its own part of the country. Mr. Ross expressed his indebtedness for many of his descriptive and historical notes to Mr. J. R. Findlay, at one time tenant of Hatton, and who, he said, prepared an interesting monograph. On the motion of Dr. Rowand Anderson, a vote of thanks was awarded to the proprietor and to the tenant for permitting the visit, and to Mr. Ross for conducting the party.

## JUBILEE DECORATION.

A CORRESPONDENT of the *Times* says that at the present moment there is but one comprehensive plan in the field for the decoration of London in June. It is the work of Mr. Frederick Vigers, an artist, and of his brother, Mr. George Vigers, an architect, and, being the only scheme yet formulated, it is worthy of consideration.

This scheme proposes the erection of triumphal arches in Whitehall to illustrate the alliances of the Royal Family. The Indian Empire would be represented in symbolical fashion in Piccadilly at the top of St. James's Street, the Services would be similarly represented in Pall Mall, Canada in the Strand, the whole British Empire at Ludgate Hill viaduct, Australasia at the west end of Cheapside, Africa in King William Street and the British Empire a second time in the High Street, Borough. There would be a device consisting of three columns on either side of the street at the south side of St. Paul's, bearing portraits and allegories of the two great Queens, Victoria and Elizabeth, and drawn across the street between the sets of columns would be a broad cloth painted with a design of the rose and oak of England and the badges of the two Queens. At the western steps of the cathedral, on either side of a spire-shaped baldachino in cloth of gold and red brocade, would be two long canopies of red brocade with a golden design, the whole supported by pillars, in red velvet

and gold, bearing golden figures of angels with uplifted wings. Two similar canopies of red would be erected beside the Temple Bar memorial. The streets would be lined with masts bearing the names of the famous men of the reign, and between the masts, parallel with the houses, but not crossing the streets—so as not to impair the view of the procession—would be garlands, while across the footway, from each mast to the wall at the back, other garlands would be hung, a different combination of colours being adopted for each street. Around the monuments of Royal personages along the route would be pillars bearing the Royal arms, and around those of great soldiers and sailors pillars bearing "victories" and laurel wreaths. In Trafalgar Square great columns would be erected bearing "victories" and British lions alternately, and tablets containing the names of the men of action of the reign. There would be double columns with shields inscribed with lists of the victories of our greatest heroes. A scheme of illumination on an elaborate scale is also embodied in the projected plan of decoration.

The designs of Messrs. Vigers's scheme have been submitted to Mr. Armistead, R.A., Mr. Calderon, R.A., and Mr. Alma-Tadema, R.A., and have elicited warm expressions of approval. Without claiming for the scheme that it is the best that could be devised, it may fairly be said that it is a very creditable and successful attempt to treat a difficult subject with taste and artistic skill, and should certainly not be dismissed without receiving the consideration which it merits.

## TESSERÆ.

## Roof of Westminster Hall.

THE roof over Westminster Hall was finished about 1399 in the reign of Richard II., the principals being 68 feet in span and about 18 feet apart, each formed of a pointed arched rib in its section upwards of 2 feet each way, spanning the width of hall, intersecting at about half its height with a massive hammer-beam of similar scantling, and extending on one side to the feet of principal rafters, and on the other to a similar extent; so that, if secured on a central pivot, this timber might be acted upon as a scale beam or lever of the first order, and if loaded equally at both ends would remain in its horizontal position, while the entire weight would be concentrated on the pivot and thrown on the supporting arch. Mr. Thomas Morris says that, "If, taking the hammer-beam as a base, we draw a perpendicular line from the inner extremity, it will be found to cut the surface of the roof just midway between the roof and the ridge, and taking this surface line as the hypothenuse, a triangle will be completed. This triangle will be found to have an exact counterpart in the upper half of the roof; but as the weight is proportionate to the superficial area, it is only necessary to explain that this area is divided longitudinally into two equal parts; that under this divisional line a purlin exists upon which is collected the weight of the upper half of the roof, and this weight is transmitted by a vertical post to the inner end of the hammer-beam. The lower half of the roof discharges in like manner its weight on the outer end of the same timber, and the equipoise is thus rendered perfect."

## Greek Proportions.

The Greek architect attached the highest importance to the determination of his dimensions by proportion, and to the execution of those dimensions with minute exactness. Accidents and faults apart, for which a margin must be always allowed, nothing was left to chance, random, or remainder. Dimensions are proportional, in the customary sense of the word, when they have a common measure; but it becomes of importance to decide in what directions they are most appropriately taken, which lines are architecturally characteristic. The Greek architects brought into comparison dimensions measured along the same straight lines, or lines parallel. Thus the height of an entablature may be commensurable with the height of a column, the breadth of a metope with the breadth of a triglyph, the height of a naos door with the height of a pronaos column. Another important form of comparison is between dimensions taken at right angles to each other. Thus it seems obvious and reasonable to estimate the proportion of an oblong plan by comparative statement of the length and breadth; no doubt its form might be recorded and communicated numerically by the statement of the angle of its diagonal with a side; but the eye does not judge such a proportion by reference to the diagonal. The comparison of length and breadth of the temple measured upon the top step, of the height and length of an apartment, of the height and breadth of a façade, or a triglyph, &c., are examples of rectangular proportion. Assuming it to be determined that no dimension shall be admitted into a design that shall not be proportionate to some other dimension, either rectilinearly, rectangularly, or both ways, it still remains to be considered what proportions or what ratios (using an equivalent expression) shall be adopted. Ratios even of low numbers exclusively offer themselves in crowds, and are to be subjected to arrangement

and selection. If we commence with two equal lines, and leaving one unaltered, alter the other by continuous diminutions, we shall find every conceivable or possible ratio occurring between absolute equality, 1 : 1 on the one hand, and absolute disparity, 1 : ∞ on the other. If we pause at certain stages of the progress, as determined by some principle, these resting-places will form a scale of proportion, a series of steps by which we may regulate degree of approach to and departure from equality between any compared dimensions or series of dimensions. On what principles are the resting-places to be determined, the scales constructed? First, the design itself will necessitate the adoption of certain ratios from the requirements of purpose and plan. Secondly, the variety of exigencies demand that the other selected ratios should range pretty widely over the interval to be divided, and give a choice of proportions verging towards inequality and well as towards equality, yet with sufficient interval to preclude confusing proximity.

#### Da Vinci's "Della Pittura."

Eminent and notorious as are the benefits conferred upon art by the written precepts and the painted examples of Leonardo, their value has nevertheless been questioned and depreciated. The malapert spirit of cultivated mediocrity has risen with ingratitude against its most venerable benefactor. The unfortunate and ambitious Haydon sanctioned it by his voice when he remarked that Sir Joshua Reynolds "first brought the principles of art into something like consistency; and, though greatly indebted to Coypel, he first rescued it from the trash of De Piles, the commonplace receipts of Leonardo, great man as he was, and all the old bewildered theorists." Why, Leonardo was to Reynolds what Cadmus was to Augustus Mathiæ: he created the very alphabet of the art of which Reynolds was only the ingenious expounder; he created the very language of the art, and Reynolds, by a precise and laborious classification of that language, rose no higher than to become its grammarian. As well might we rate the first type-founder now living as superior to Gutenberg; as well might we give precedence to a Glasgow engine-builder over the immortal Watt; as well might we regard a modern optician as worthy of more veneration than Newton or Galileo. It is evident that the sarcasm of Haydon is directed against the celebrated treatise, "Della Pittura." That composition is, in itself, a brilliant contrast to the sneer. But artists of unquestionable genius have afforded a counterpoise to the contemptuous allusion of Haydon, by the panegyrics which, both in conduct and expression, they have pronounced upon that renowned treatise. "Della Pittura" was the *vade mecum* of Nicholas Poussin. On first beholding a manuscript copy of the work, Annibali Carracci lamented that he had not perused it before, declaring it to be his conviction that it would have saved him twenty years of assiduous toil. Not to mention the eulogium passed upon the *trattato* by the competent judgment of the Count Algarotti, there is a sufficient guarantee that its chapters cannot consist of merely "commonplace receipts," in the extreme caution which characterised the intellectual researches of Leonardo. In reference to this cautiousness, M. Saint-Germain distinctly asserts that the great artist was more engaged in investigating the theory of his art than in labouring upon his pictures:—"Il employait à la théorie de son art beaucoup plus de temps qu'il n'en mettait à l'exécution de ses tableaux;" or, as the Abate Luigi Lanzi has otherwise expressed it, in his eloquent "History of Painting in Italy," Da Vinci was more solicitous to improve the art than to multiply his pictures, "Più a migliorar le arti, che a moltiplicarne gli esempi," and hence his easel was less prolific than those of his distinguished contemporaries. Another analytical writer has elsewhere penned a sentence which would almost seem to have been a predestined climax to the foregoing quotation. Summing up the qualifications of Leonardo as a painter, André Félibien declares that, as a theoretic artist, he remembers no one who has evinced such wisdom—"Je ne sçay pas mesme si depuis luy il y en a eu d'aussi sçavans dans la théorie de cet art." Though we would by no means imply that the judgments of Saint-Germain and Félibien are to be considered as infallible, we are satisfied that their opinions are, at the least, admissible against the platitudes of Haydon.

#### Wren's Model of St. Paul's.

In contemplating the floor plan of the rejected model of St. Paul's, we immediately see how its author has set at naught the influence of familiar custom as a cause of beauty. We have a general outline and internal disposition of parts perfectly original. Instead of the ordinary rectangular combination, we have the square, the curved, the polygonal, the concave, the convex, the recessed, the salient, affording the most varied play of full light and half light, sharp in contrast with shadow and shade, or softly gradational the one into the other, while the outline of the plan includes within its full-bodied expanse the cross as the skeleton form, whose dome-crowned centre is the "heart of the mystery." In the existing cathedral we see the old Gothic model Romanised, with a dome vice a central tower, and instead of flying buttresses openly exhibited, a

decorated screen looking like an upper storey, concealing them; but in the model we have a design not less original than magnificent, with artistic feeling far exceeding what is displayed in any single building of ancient or modern times. The refined pictorial, of bulk and varied form, here presents itself in lieu of the Gothic picturesque, of attenuated length and transeptal interruption. And now leaving the outline, let us contemplate the floor plan. Let the reader especially imagine the first long and narrow perspective from the west door, the forthright and divergent views on his passing the arch next beyond the vestibule, the view on just entering beneath the great cupola, that from the centre of the same, and that from beneath one of the diagonal cupolettas. All this justly considered he may so conceive of the magical effects realised as to see "with his mind's eye" how comparatively commonplace are the effects produced in the existing cathedral. Well may we believe that its designer wept at the rejection of his model, and well might we weep that it was rejected. In the model the portion for the choir is of a form much more adapted to the purposes of Protestant worship than in the building, and of a capacity equivalent to what Wren pronounced the maximum size for an auditorium, in which all the sitters may distinctly see and hear the preacher, *i.e.* it is equal to a room 80 feet long and 50 feet broad, exclusive of the space required for the organ and the communion recess. Wren was the last man in the world to design a building without a full regard to its use. He rightly felt, however, that a cathedral is not a mere thing of practical utility, but that it should be the offering of art's best to the Giver of artist genius. In St. James's Church, Piccadilly, he considered the matter on mere utilitarian grounds, and even there produced a structure the interior of which remains a monument not more of his scientific economy than of his feeling for the beautiful.

#### Gas-lighting in Picture Galleries.

There is nothing innate in coal gas which renders its application to the illumination of picture galleries objectionable. Its light, though not so white as that of the sun, is equally harmless; its radiant heat may be rendered innocuous by placing a sufficient distance between the gas jets and the pictures, while the heat of combustion may be rendered eminently serviceable in promoting ventilation. Coal gas may be free from sulphuretted hydrogen compounds; it then has little or no direct action on pictures. But it has not as yet been entirely cleansed from sulphide of carbon which, on combustion, yields sulphurous acid gas capable of producing 22½ grains of sulphuric acid per 100 cubic feet. It is not safe to permit this product of the combustion to come in contact with pictures, painted either in oil or water-colours, and in every system of permanent gas lighting for picture or sculpture galleries, provision should be made for the effectual exclusion or withdrawal of the products of combustion from the chambers containing the works of art. Certain colour tests were arranged by a commission consisting of Faraday, Hoffman, Tyndall and Redgrave. They consisted of surfaces covered with white lead or with vegetable and mineral colours (especially the more fugitive ones), and in which also boiled linseed oil, magylop and copal varnish were employed as vehicles, and were, when dry, covered one-fourth with mastic varnish, one-fourth with glass, one-fourth both mastic varnish and glass, and one-fourth left uncovered. Sixteen of these were placed for nearly two years in different situations, in some of which gas was used, in others not. They gave no indications respecting the action of coal gas (except injury from heat in one placed purposely very near to and above the gas burners), but seven of them show signs of chemical change in the whites, due to either a town atmosphere or want of ventilation.

#### Abyssinian Buildings.
